The subject of commercial expansion abroad has been tackled, as is usual in Germany, both scientifically and practically, and, as might have been expected, called forth also two scientific institutions, and a new publication, Greater Germany.

tically, and, as might have been expected, called forth also two scientific institutions, and a new publication, Greater Germany.

The Government's paternal care for Germany's foreign trade has found a noteworthy expression in connection with the foreign loans placed upon the German market. Pressure has so long been brought to bear upon the leading banks that it has now become a recognised practice that, before a foreign loan is taken over, the Ministry of Commerce is consulted to ascertain whether the issue would be a desirable one for commercial reasons, though some financial quarters object very strongly to this novelty of what they call a financial protection. Very important commercial orders are thus being obtained abroad. The practice has already become so firmly established that something of an apology was published early in 1914, when part of the Bosnian loan was taken over by German banking houses without commercial concessions having been obtained. The Budapest municipal loan brought Germany a rich crop of industrial orders; the industrial demands in connection with the Bulgarian loan, which were admittedly onerous because the German money market was the only one available at the time, were greatly responsible for the failure of the negotiations on the original basis.

Tendency Towards Standardisation.—The desire to save expensive labour has naturally led also to an increased use of machines. The change has not been without its effect upon the traditional spirit animating German manufacturers that they entered more willingly than others into a customer's special intentions. No doubt the inclination still holds good to some extent—yet a careful student can discover a change; the scramble is becoming more and more one for orders of standard patterns; difficulty is beginning to be experienced in finding manufacturers willing to accept those stray orders for

dard patterns; difficulty is beginning to be experienced in find-ing manufacturers willing to accept those stray orders for goods which differ from the ordinary patterns. Once the machine has been set for a while the experienced workmen of the older school cease to be available.

NEW PATENTS APPLIED FOR, 1915.

(NOT YET PUBLISHED).

EDITION

IN THE PRESS.

H. Alabaster, Gatehouse & Co., 4, Ludgate Hill, London, E.C.

STANDARDISATION OF COOKING AND HEATING APPARATUS.

Amongst the various matters of interest which claimed attention at the recent meeting of the Point Fives, we notice that the Chairman's suggestion that the simpler class of cooker could now be practically standardised, to facilitate manufacturing in quantity and reduction in selling cost, met with little response.

Any suggestion of this sort usually meets—as this did with the reply that the time is not ripe for such a move, as improvements are constantly being introduced, and so on; and there the matter ends for the time.

But let us face the facts. Those blissful conditions of domestic life in which the electric cooker is to play such an ambitious rôle will never be attained while electric cooking apparatus is beyond the means of the average householder-" point five" tariffs notwithstanding-and we must admit that the technical advantages likely to be derived by allowing the designer of apparatus absolute freedom in his efforts will not necessarily be translated into commensurate economies in manufacturing, with which we are mainly concerned.

We are reminded that some meritorious inventions might never have seen the light of day, had not the ruthless commercial man cut short the process of perfection on which the inventor was engaged and applied his ideas then and there to some practical purpose, and we fail to see why the electricity consumer of to-day should be denied the benefits of organised production in order to provide future generations with a more perfect edition of what is already an efficient apparatus.

At the present time each manufacturer standardises his own products, as far as possible, apparently without prejudicing experimental development, and what is required on the part of the central-station authorities and manufacturers is some agreement fixing standard lines of development, and standard dimensions and ratings, and aiming at some degree of interchangeability of parts.

This is obviously a matter in which the Point Fives could set the ball rolling, and which the recently-formed Electrical Development Committee of the I.M.E.A. could investigate through a technical sub-committee, with a view to presenting a report for discussion at the annual convention. Such a report, if it only reviewed the position at the moment, would be instructive and, no doubt, would lead to some explanation of the considerable divergencies in design which at present exist.

Take, for instance, the following data for what we may call—only from the resemblance in outward shape—"gasstove "type electric ovens by four well-known makers. The cubical capacities of the ovens, which are apparently intended for cooking for an "ordinary household," vary from 5,500 cb. in. down to 3,600 cb. in., while the maximum loadings

are '54, '59, '44 and '66 watt per cb. in., from large to small size. Another widely used oven of a different type, of 4,250 cb. in. capacity, has a maximum loading of only *37 watt per cb. in.

In the matter of boiling plates makers are equally at variance, a few lists showing 7-in. plates with loadings of from 800 to 1,000 watts, and 8-in. plates with loadings of from 800 to 1,200 watts (each individual maker having his own rating for each diameter), while a glance at the particulars of hot-water urns leads to the assumption that some makers are prodigal in their ratings, or that the others possess the secret of efficiency to an extraordinary degree.

Making allowance for certain technical differences, which can be readily explained, there still appears to be scope for some standard lines of development along which the ingenuity of the designer should be directed for preference, at the earliest possible moment. It is fair to assume that the electric cooker will be placed in the hands of neither more nor less skilful users than is the case with the gas cooker, and that the latter gives a reasonable degree of satisfaction will be granted, despite the filthy conditions which often prevail, and discount any approach to the efficiency in use which the designer presumably intended. The only efficiency which counts is that obtained by the user, and progress in this respect is only deferred, so long as the apparatus is generally out of reach.

the Technical

THE greatness of Manchester as an Engineers and engineering centre is unquestionable, and in consequence it has good reason to be proud of the large army of engineers of

all kinds who follow their callings in the district. And Manchester being smaller and more compact than London. and possessing a frequent and convenient tramway system, which takes you in from the outer manufacturing districts right to the heart of the city where hotels and other such public meeting places are to be found, its engineers, both professional and trade, have succeeded in establishing a very useful institution known as the Engineers' Club. Here excellent opportunities are afforded for social intercourse, for "talking shop," and for comparing views on engineering matters of the moment. Amid such surroundings it is possible to conduct proceedings with greater freedom and less formality than would be considered becoming at a full-dress discussion at a dignified institution. But even at an Engineers' Club if you want a successful gathering there must be a good subject and an author who, by practical experience, is able to deal with it authoritatively. The Manchester Club is not confined to technical engineering matters, indeed sometimes it aspires to scale the heights to far loftier regions. It has comparatively recently brought its weight to bear by discussing measures for giving a stimulus to the Board of Trade, so that it may represent engineering and other industry more worthily in these trade-capturing days and in the future when pruning hooks and ploughshares have succeeded to less peaceful contrivances. Of the Club in this connection we say more power to its elbow! Still more recently it has had a discussion on "The Engineering Trade and the Press." Unfortunately, when the Board of Trade was under fire every nail of criticism that was driven home must drive into that one Board-it could not point to any other culprit; but when the Press comes in for critical attention, everybody finds the cap to be -well, Now, everybody who has not been on a misfit. the I'ress knows perfectly well how it should be run,

and it has not been unknown for the Press even to suggest measures for the more enterprising conduct of some branches of engineering industry. How far the engineer is capable of running the Press, and how far the Press is able to assist the engineer, would be a most excellent subject for a Club debate. Our own view, after having had something more than an average experience in both capacities, is that their functions and operations are mutual and co-The technical Press depends upon the enginearing employer because he is an advertiser, and upon the professional engineer because he is a reader, and very often a most acceptable writer. The engineering employer and professional engineer alike depend upon the technical Press, because it informs them upon many matters, tells them of developments that will bring them business, and if they advertise takes their names to the uttermost parts of the earth—if it goes there. Now seeing that the Press has ventured to make suggestions to the engineer, nothing is more natural than for the engineer to desire to assist the Press to increase its own efficiency. Whereat we, of all Editors, shall be the last to take offence. Indeed, we welcome any movement that engineers and the engineering trade may think fit to institute, for inquiring as to which out of the scores of journals published in these days of trade-expansion efforts meet their requirements most satisfactorily. Where there are large families there may not be so much to go round as where there is one petulant spoilt child, unfettered, and licensed to go its own way, but there may be a spirit of self-help and independence engendered by sheer necessity. It may be so in respect of the Press. There may be a large family, but only the members that are able to give evidence of proved ability to assist profession and industry are allowed to survive for any length of time, unless manufacturers and traders, the while they grumble because there are so many of us, open their hand with indiscriminate generosity. When the Manchester Engineers' Club held its discussion a week or two ago, it was fortunate in having as the opener of its debate, Mr. Frank Nasmith, editor of the Textile Recorder. We congratulate the club upon having such a high standard of journalistic practice put before it, and the author upon having the courage to express his views. As a general rule, we prefer to let our pages speak for themselves concerning the store of valuable material that very carefully considered and very definitely adopted policies lead us to publish; we also prefer, on the whole, to let manufacturers' own correspondence and order books tell them where our REVIEW circulates regularly every week-not once now and again when the fit takes us. But it is as well that occasionally an editor should meet the representatives of the industry as Mr. Nasmith did at Manchester, and bring before their notice how much they owe to the technical Press when it carries on its operations in such a way as to win the life-long attachment of its readers by publishing the information that they require but can obtain in no other way, and by exercising a spirit of independence and fairness in maintaining a high standard of editorial policy.

THERE has been a very satisfactory business done in lead during the last few weeks, and while there has not been any elasticity shown in prices, there has nevertheless been a steady tone in the market. Much of the selling witnessed came from agents for the Convention who, at times, appeared anxious to keep down the price, probably in order to prevent America getting a fresh foothold here. American lead has on more than one recent occasion proved a bugbear, and the leading interests here have an antipathy to material being offered from across the Atlantic because it spoils their market.

There has been a good deal of metal coming to hand from abroad, and this has resulted in the market being pretty well supplied with material. The natural sequence to this is that there has been a weakening in the price of spot and early delivery material compared with forward, but the discount does not amount to much, though the fact that there is a discount is worth recording. For the most part everything which is coming forward appears to be wanted, but there has been a falling off in the demands met with from Russia, which country has for a long time now been one of the mainstays of the lead position. Not only have considerable quantities of lead been shipped from England to Archangel, and also from Australia direct to Vladivostock, but sales have also been made for shipment from New York to the latter port. Attempts have been made also to ship direct from Spain, but the shipping difficulty seems to have proved insuperable in this case. With the approach of the spring it is to be expected that the Vladivostock route will lapse into disfavour, because Archangel is much handier.

The main consumption in progress is undoubtedly in connection with the supplies of ammunition required by the forces in the field, and the demands experienced on this account can hardly undergo any important abatement for some months to come, or at least until the war has entered upon a new phase. There is considerable dislocation still in the Broken Hill region of Australia, but taken all round output appears to be quite sufficient for all practical purposes. Mines and smelters are partially at work and under the restrictive conditions affecting general consumption as distinguished from consumption for war purposes, there is apparently plenty of lead available.

The position in North America is rather uncertain. For one thing the remarkable advance in the price of spelter has put this metal into an altogether false relation to lead, and this tends to have an unsettling effect upon markets, while in Mexico chaos continues to reign undisturbed. It is quite possible that if only the congestion at the docks abated and lead were to be got out of arriving steamers with something approaching reasonable expedition, there might be a small further reduction in the price of early deliveries, but so long as congestion reigns undisputed, something near to-day's level of prices seems likely to be continued, always supposing that no unforeseen new factor comes into play.

The International Aluminium -Industry. A SCHEME is being promoted in Germany for the purpose of rendering that country independent, if possible, of the quotations for various metals which are given on the London Metal Exchange, on the

return of normal conditions after the conclusion of the war. A subsidiary exchange for copper has already been in existence for two or three years in connection with the Berlin and Hamburg Stock Exchanges, and the Exchange Committee of the former has now been asked to extend the scope so as to include quotations and contracts for spelter, lead, aluminium, and antimony. The question as it affects the four metals has been set forth in a memorandum, an extract from which, concerning aluminium alone, may, perhaps, be of interest. As is well known, an international aluminium convention or syndicate was in existence down to the outbreak of the war. The sole object of the syndicate was to regulate the production of the works and prescribe minimum prices, and, in the absence of a sales organisation, the business with consumers was generally conducted through a number of merchants. According to the experience gained in recent years, the price which consumers have had to pay has differed in many cases from the particular charge which was fixed by the syndicate. During periods of great demand the merchant price has rapidly risen above the syndicate minimum, but at other times, when large quantities of aluminium have been in the possession of the merchants, the prices actually realised by the latter have been much below those of the syndicate, so that it may be said that the actual course of prices has been probably influenced on wide lines by the syndicate, although not settled individually by the combination. The world's

production of the metal increased from 8,200 tons in 1903 to 68,200 tons in 1913, and a further large augmentation is expected in the future. The memorandum states that this fact, taken in conjunction with the circumstance that next to the United States Germany has the largest consumption, renders it desirable that the latter country should secure the important position in the world's market to which it is entitled, by the establishment of a German Exchange. The idea is that by the creation of such an exchange aluminium could be delivered both as original works' material and as remelted metal; the former in ingots, bars, and sheets, and the latter in ingots, having a percentage of from 98 to 99 per cent. of pure metal. It is further suggested that in addition to Berlin the places of delivery should be Hamburg, Rotterdam, and Antwerp, and that a reduction of 5s. per cwt. in the contract price should be made for remelted material. As the aluminium works have always concluded long term contracts and have granted to purchasers the right of calling for delivery in from six to eight weeks, it is proposed that the quotations on the exchange should be for one particular month and the 11 succeeding months. As bearing on the present situation of the international market, Norwegian newspapers report that a company at Stavangar recently purchased aluminium in the United States of the value of £54,000 owing to the European market being closed. In Norway itself the productive capacity is undergoing a great expansion. The Anglo-Norwegian Aluminium Co., for instance, is credited with having now completed its works at Vennersla, where 2,000 tons per annum are to be made; a second company, having French working capital, is said to have acquired the undertaking of the Hardanger Electrical Iron and Steel Co. for the purpose of constructing cables of aluminium, and the Norwegian Nitrite Co., of Eydehavn, is also declared to have erected a large works for the output of the metal.

The Swiss Electrical Industry. A FURTHER contribution on the subject of the situation of the electrical industry in Switzerland is contained in the December issue of the publication issued by the

Swiss Credit Anstalt. The report states that during the first half of 1914 the industry was very well employed, and also had an abundance of orders in all branches at the close of June. Despite the complaints which were being made at that time in various countries as to the course of business, it was confidently expected in Switzerland that the results for the electrical industry would be favourable for the whole of 1914, but every estimate was upset by the outbreak of the war. It has to be borne in mind that Swiss firms have to depend upon the export trade for the greater portion of their business; the inland market alone could not have kept them employed even if trade in Switzerland had not experienced a decline through the war. On the outbreak of hostilities the foreign trade was at first completely tied up, and at the present time it can in no way be foreseen when, and to what extent, a revival will pro-bably take place. The demand on the part of different countries has undergone a very material shrinkage, apart from the many obstacles in the way of transport to destinations, whilst the collection of payments from abroad is a matter of greatest difficulty. There is also uncertainty as to whether or not the Swiss industry will be brought gradually to a complete standstill owing to the hindrances to securing the delivery of raw materials, and considering the whole of the facts, the report concludes that the only course is to await developments.

Electrolytic Production of Oxygen.—Several factories in St. Louis, Mo., are now engaged in the electrolytic production of commercial oxygen gas. The electrolyte used is a 10 or 15 per cent. solution of either caustic soda or caustic potash. The oxygen given off at one electrode is collected and compressed, while the hydrogen given off at the other electrode is allowed to escape.—Chemical Trade Journal.

MODERN WIRING WORK, PARTICULARLY IN BAD SITUATIONS.

By H. C. TOFIELD.

(Continued from page 169.)

An installation earried out with C.T.S. wires is not intended to compete with thin, close-joint, slipconduit and foreign V.I.R. cable. Cheap conduit installations frequently entail considerable expense in repairs owing to subsequent breakdowns after being installed a short time, while the use of slip conduit is prohibited under the rules of the Institution of Electrical Engineers, by the Fire Insurance Companies and a large number of Supply Authorities.

Where a system of wiring is to be installed in a wet or corrosive situation and is expected to successfully withstand these conditions, the best material must be used, and cost is not usually such an important point as the provision of a first rate job. In fact, cost is often taken as the most unimportant item in a first rate job, such as where one occasionally finds contractors who have been given the mainten-ance charge of jobs in severe situations, as acid factories, but prefer to stick to other systems of wiring, however useless they have been proved, so long as they can say the consulting engineer specified it originally. It is difficult to imagine what is the reason for such conservatism, but it is quite clear that a maintenance job is a very useful one in slack times.

It is in such cases as these that the C.T.S. wiring system has its special advantages over any other method of wiring, for it will provide a satisfactory installation under most circumstances with a mini-

mum expenditure.

The best insulated wires are of little value in bad situations if the fittings do not protect the ends of same as efficiently as the wires themselves are sheathed, and in order that they shall be fully protected, several fittings have been specially designed for corrosive situations as previously mentioned, and some further details of these may now be given in conjunction with the classes of work dealt with.

The types of buildings usually met with in which it is proposed to instal electric light or power may be divided into three classes, in much the same way as the fire insurance companies differentiate be-tween "hazardous" and "non-hazardous" risks. Where the installation would be called upon to

carry out its functions under severe conditions, it might be termed a "hazardous" risk (see Class "A" below) not of course from the fire insurance point of view, but from the fact that the wiring would be more liable to breakdown, and therefore, extra precautions would have to be taken in carry ing out the wiring of the installation and in the choice of accessories, while in cases where conditions were normal (as in Class "C") a thoroughly satisfactory job could be provided with the type of accessories commonly met with. From which it will be seen that while C.T.S. wires are of the same quality in all cases, different types of fittings must be used for various classes of installations in order to suitably protect the ends of the wires according to the positions in which they may be installed. The different types of installations may be divided as follows:

Class "A."—All buildings such as chemical works, salt works, dye works, powder works and magazines, bleach works, paper mills, tanneries, soap works, oil and petrol stores, bacon factories, laundries, baths, washhouses, cold stores, breweries, stables, jetties, also workshops and factories where damp or corrosive conditions exist, and rolling mills. collieries, and other places where fittings would be subject to mechanical damage in addition to corrosive action.

Class "B."—All new buildings in ferro-concrete

or brick and unplastered, where the wiring is to be concealed throughout and wires sunk in walls and ceilings ready for making good. All ceiling fittings, switches, distribution boards, &c., to be fixed when

the decorations are completed.

Class "C."—Private houses of every description, banks, offices, shops and all similar places in which it is desired that the wires shall be concealed throughout, or partly or wholly run on the surface as occasion may demand. All workshops and factories which are clean and dry, the wires being run on the surface of the walls and ceilings.

Cables.—The types of C.T.S. cable obtainable for

wiring are as follows:-

Single-core circular.—This is suitable for all classes of concealed wiring and for surface wiring.

Twin or multicore circular.—This is also suitable for Classes "A," "B" and "C," and particularly

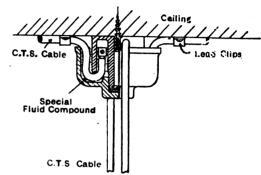

FIG. 1.—PART SECTION OF CORROSION-PROOF JUNCTION BOX.

so for all long runs and for main and sub-main cables feeding distribution boards, also for laying direct in the ground, as for instance, for garage lighting supplied from house, or outbuildings from factory.

Flat section twin and three-core.—This is most suitable for Class "C," also for surface wiring and concealed work in dry situations.

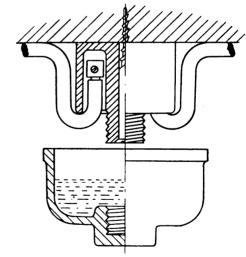

FIG. 2.—PARTS OF JUNCTION BOX.

Fittings.—Special fittings, such as junction-boxes, distribution boards, switches and lampholders are only required in connection with work carried out in places similar to those enumerated under Class "A."
For Class "B" all ordinary switches, distribution

boards, &c., can be used.
For Class "C" a neat junction box is utilised. as it is invariably used in clean and dry situations. As twin flat and three core flat wires are employed under Class "C," the use of this box will obviate loops to switches, &c., and so considerably simplify

the method of wiring and save expense. Any kind of switches, &c., may be used.

Corrosion proof fittings for Class "A." Ceiling type junction box (White's Patent).—This fitting is made of porcelain, and allows the cable ends to dip into the inner sealing chamber, divided by partitions to separate the poles. The chambers are filled with

a semi-liquid material of an insulating and waterproof nature so as to effectually keep out moisture and corrosive vapours or gases. (See figs. I—3.)

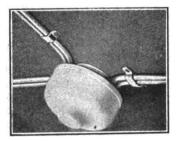

Fig. 3.—Ceiling type Junction Box in Position.

The fitting is easily fixed, and by filling the outer cup with the sealing liquid before screwing it up, the whole is completely sealed. It forms either a two or three way connector box, and allows the ordinary "loop in system" to be carried out, while it also acts as a "ceiling rose" from which the C.T.S. leads are to the corrosion proof lampholder.

Wall type junction box (White's patent).—The method of sealing is on the same principle as the above, but the box is adapted for fixing on the wall.

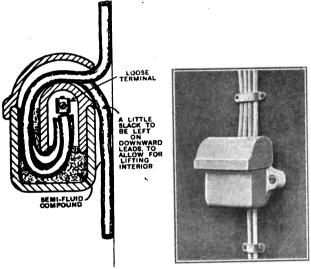

Fig. 4.—Section. Fig. 5.—Box in Position. Wall-type Junction Box.

The leads, up to three per way, may be brought in or taken out in any direction. The downward leads must have a little slack allowed so that the interior may be lifted out when required.

(To be concluded.)

REVIEWS.

Motion Picture Operation: Stage Electrics and Illusions. By H. C. HORSTMAN and V. H. TOUSLEY. London: S. Rentell & Co. Price 8/6 net.

This is intended to be a practical handbook and guide to electricians employed in theatres, kinemas and stage illusion work, and the authors have attempted, with some measure of success, to compile a reference book which should contain as full information as possible relative to the matters with which such employés would come in contact. Where possible the authors have avoided the use of technical expressions, so that such non-technical men as managers and stage carpenters can readily understand the text. A slight working knowledge of electricity has naturally been assumed on the part of the reader, however, but there is no attempt to elaborate this, consequently the book is of a severely practical character. In it are two special chapters, "Portable Stage Equipment" and "Theatre Wir-

ing," which have been arranged so as to be particularly valuable for reference, and the authors say that these chapters embody all the practical knowledge that has come to their notice during many years of actual experience with theatrical work.

In perusing these chapters, it has to be borne in mind that they were primarily written for American readers, and there are consequently terms and allusions which sound strange to English ears. Also there are a number of extracts from the National Electrical Code which are not likely to prove of any value to a reader in this country. Nevertheless, the chapters are full of information which is of value and should go far to improve the quality of the work carried out by stage hands who are not fully qualified electricians.

One of the features of the book is the number of diagrams given, but in connection with these it would be well to include new blocks in future editions, as several of those used have evidently seen much service. In fact, for an American publication, the illustrations, particularly the half-tones, are poor.

Perhaps the most useful part of the book is that devoted to the motion picture machine or bioscope. A number of types are described and illustrated, full and complete directions for working are given, and a special chapter is devoted to general hints on the installation, operation and care of machines. The book can be recommended to everyone engaged in the picture theatre business, although it is not so certain that it would be of great value to electricians engaged in the English theatre or music hall world. G.B.B.

Electric Cooking, Heating, Cleaning, etc. By "Housewife" (Maud Lancaster). Edited by E. W. Lancaster, M.I.E.E. London: Constable & Co. Price 3/6 net.

Under the above somewhat unwieldy and comprehensive title, a very useful and interesting compilation has recently been published. Though not particularly novel in its contents, it is still worthy of the attention of central-station engineers and all those interested in extending the use of electricity in the homes of the people. It serves both as a handy collection of various data and also as a book for recommendation to potential users of electricity for purposes other than lighting. Works of this nature are scarce, there being but two others which give anything like similar information—and one of these is written in the German language.

On the other hand it is not a book that would appeal to the average housewife. This is disappointing, for judging from the nom de plume of the writer one would expect some really practical information from the housekeeper's point of view. In style it is somewhat laborious and lacks freshness and vivacity.

If it is intended as a book of reference, the absence of an index largely militates against it. A full list of contents is given, but it is essentially clumsy and difficult of reference.

Approximately two-thirds of the book deals with electric cooking, and it is this portion which is the more masterly in treatment; the remainder is rather weakly tackled, apparently from the lack of practical knowledge on the part of the authoress and her editor. Of course there are comparatively very few persons who really have any extensive experience of domestic applications of electricity in other fields than lighting and cooking. An especially valuable feature of the early pages consists in a brief discussion of the scientific principles underlying the art of cooking—information concerning which is normally very difficult of access, for the usual cookery manual does not deal with this aspect. From this it is proved that slow cooking, at temperatures which are perfectly under control, is the ideal method. This, as it happens, is the distinctive characteristic of electric cooking. Thus the overwhelming advantages

in favour of electricity as a cooking agent are clearly substantiated in a manner that many of its advocates do not fully realise, otherwise they would make their case even stronger. If the ordinary housewife understood these principles, the introduction of cooking by electricity into the home would be far more rapid. However, notwithstanding the analysis of these principles, the authoress does not seem fully to comprehend the efficiency, economy, and general advantages of the so-called fire-less or stored-heat cooker. It is true that a number of examples are cited, but they are indiscriminately mixed up with ordinary electric ovens.

Descriptions are included of a bewildering list of electric cooking apparatus, but very little practical assistance of real value is given to help a novice

in making a wise selection.

To find a "housewife" inditing a homily to central-station engineers is somewhat amusing; perhaps, however, this is due to the influence of the mere male editor, whose name in this capacity is associated with that of the authoress on the title page. Nevertheless, a good point is arrived at in the suggestion that every central-station engineer should equip his own house electrically, so that he at least may gain experience at first hand—if he won't do this his committee or his directors are to insist upon it.

For some unfathomable reason a selection of oven temperature curves is inserted in the middle, instead of at the beginning or the end, of the description of every oven concerning which the authoress could obtain particulars. One of these diagrams is particularly noteworthy, for it deals with the comparison of a bright unlagged sheet metal oven and a lagged oven—to the disadvantage of the former. This collection of graphs is interesting, for it is This collection of graphs is interesting, for it is probably the first time that such a number has been published together, and some enlightening comparisons can be drawn from it. Of course all these diagrams emanate from a biased source, with no particulars as to how the temperatures were measured, and there is no more ticklish job than deciding what is the actual temperature of an oven. Further, any results are immediately upset when a joint is put into the oven.

Some thirty-eight pages are very wisely devoted to descriptions of large electric cooking installations in hotels and restaurants. This is the sort of thing that assists in convincing people as to the practicability of electric cooking, for if it pays commercially it must be within the reach of private persons. Moreover, such a section will be most useful when discussing the subject with architects and restaurant keepers, for so much in this country goes in accord-

ance with precedent.

Some costs of cooking are interlarded with descriptions of electric cookers, and other particulars are sandwiched in after a discourse on domestic power applications. Though the authoress states that she has an electrically equipped home, she does not appear to draw as she might upon her own experience. If she had done so, it would have added much more to the value of the book, for after all, what everyone is looking for to-day is tangible practical records.

The heating of water and the warming of rooms are dealt with in the same characteristic catalogue style as in the case of electric ovens, and readers are left "to judge for themselves which method would best

suit their individual requirements.'

Again, electric vacuum cleaners receive their meed of attention, but here also practical pointers are lacking. For example, it might be anticipated that a reader would like to know under what circumstances a blower-type cleaner is preferable to a pump or bellows pattern.

As electrically driven washing machines are not yet employed to any extent in this country, the descriptions in this book of American appliances are well worth attention. The machines themselves are

very much lighter in construction than the standard type of this country. Whereas the heavy English machine requires a I-H.P. motor to drive it, the American pattern only needs & to & H.P. A mistake has been made in asserting that the cost of operation is Id. per hour at Id. per unit. By this would naturally be understood a I-H.P. motor working at full load, whereas much smaller motors are fitted, as above stated. So much may also be gathered from an inspection of the illustrations.

An incorrect illustration has been inserted in the case of the "Magnet" electric iron (p. 275), which is one of the best on the market. However, no attempt is made to distinguish the qualities of any

one iron from those of another.

The attempt to deal with domestic applications of power is somewhat futile. All the apparatus illustrated is only suitable for hotel or shop use, with the single exception of the Electric Maid-of-allwork, which is briefly referred to on page 282. The illustration which should accompany this is given on page 287. The authoress is apparently not aware of the Westinghouse utility motor, the Alexanderwerk equipment or the Electric Mary Ann. Undoubtedly the ultimate development for domestic uses will be along the lines of some such design. Certainly the average household will not be able to afford more than one or two electric motors.

The tables on pages 290 and 314 to 333 are rather

striking examples of incompleteness.

In conclusion, the work is so much data without sufficient sequence. The beginning promises well, but its quality is not sustained, and the book has no conclusion. It lacks both originality and imagination throughout. As to the illustrations, they are generally overdone, often having little to do with the text, and sometimes not appearing to be fully comprehended by the authoress herself. They are all, with the exception of a few diagrams, very familiar to those who have had occasion to look at manufacturers' catalogues. Finally, the book is well got up, with clear type—though many of the blocks have seen use before, and the proof-reading has been done a little carelessly. But after all, one must not expect too much when 338 pages can be obtained for the sum of 3s. 6d., and certainly the book is worth this amount.

HALF-WATT LAMP FITTINGS.

By 'RESEARCH."

THE restriction of lighting in so many towns has retarded. the extensive use of half-watt lamps, but still they are getting increasingly popular. Whilst the design of the lamp itself leaves little room for improvement, this does not apply to most of the fittings supplied by the manufacturers. Dealing first with the lampholder, owing to the large current taken by the lamp the Edison screw cap was adopted. The lamp must be screwed up tight or otherwise there is heating, and ultimately arcing, taking place at the top contact. Now, in some types of fittings, the long stem of the lamp is pushed up through a small hole in the reflector, and the person screwing in the lamp cannot see what he is doing and must take hold of the bulb to screw the lamp by. The writer has known several lamps to be broken by the person thoughtlessly putting too much pressure on. Again, it has been found where lamps are suspended from tramway poles that vibration has caused the lamp to unscrew slightly, causing arcing at the top contact and the lamp to be welded to its holder.

Where the lamp is used for interior lighting, probably the best results are obtained with the indirect lighting system. It shields the eye from the glare, but an important advantage is that the lamp is freely exposed to the air and does not get too hot. The heat given off by these half-watt lamps is surprising, and when the lamp is enclosed in a fitting and globe, ventilation becomes an important problem. For ou side illumination the lump must be completely protected from rain, as a drop of water on the globe, which is at a high temperature, cracks the glass at once.

The manufacturer of fittings must therefore aim at two things: first, protection from the weather; and, secondly, a very free circulation of air past the lamp to keep the temperature down. The second item is the most difficult, and some makers have treated it as of little importance. It is most important for several reasons. The lamp is not so likely to have a long life if the heat generated cannot escape. Any copper on the fitting is discoloured by the heat, and enamel or paint used for reflecting purposes is turned brownish, and therefore does not serve its purpose. Sweating takes place on the upper part of the fitting, and the drops of moisture formed have been known to drop on the lamp and crack the globe. The first cost of these lamps being unavoidably high, it is essential that every device should be adopted to enable them to last a long time. Moisture cannot be prevented from forming on the interior of the fitting, and therefore any such moisture should drain away from the glass of the lamp.

One other point that requires consideration is the position of the filament in relation to the reflector. In one type of fitting that the writer is acquainted with, the illumination is spoilt by the filament coming too far through the reflector. The ideal arrangement would be to have a lampholder so fitted that it could be raised or lowered as desired by simply slackening a screw. The best illuminating effect could be experimented with for a given height of pole, and all lamps similarly placed could then be adjusted in the

same manner.

NOTES FROM CANADA.

[FROM OUR SPECIAL CORRESPONDENT.]

REFERENCE has been made before in these notes to the growing tendency to employ underground cables in Canada. It has recently been announced that the town of Outremont, Quebec, has just installed a new lighting system which is fed throughout by underground cables; all the lamps are nitrogen filled, which makes the town unique in both respects. It is noticeable that the appearance of a number of busy streets in the heart of Toronto is steadily improving, due to the gradual removal of overhead wires, and the demand for underground construction is becoming more insistent in all the larger cities.

In Montreal the electrical companies, telephone, telegraph, tramways and lighting, are working together to form a "Safety First" league. The "Safety First" idea has "caught on" over here, and is being boomed in all quarters, not without good reason either, seeing the immense numbers of accidents which occur, most of them, of course, preventible with the exercise of a little care and foresight.

The Montreal Light, Heat and Power Co. are organising a section of the Home Guard and will supply the arms, &c. Most of the large firms here have acted similarly.

The City of Quebec is seeking power to raise a loan with which to buy out the Dorchester Electric Co., Quebec; the reported price is \$1,000,000.

At St. John's, Quebec, the Canadian Hart Accumulator Co. has erected a plant and is now seeking orders for storage batteries.

Although there is a good deal of unemployment here many firms are being kept busy on large orders from home, though unfortunately, there is not much in the electrical line. The Dominion Steel Co., in Sydney, N.S., is making large shipments of wire and rails, and is employing more than two-thirds of the full complement of men; several firms have received large orders for shrapnel shells.

The idea of municipal ownership is travelling far in these days; in Dawson City the authorities are considering the installation of municipal electric light and telephone plant which is estimated to cost about £33,000.

The Grand Trunk Pacific Railway has recently completed the telegraph connection between Winnipeg and Prince

Rupert, B.C., the distance being about 1,279 miles; very many places, hitherto without, will now have the benefit of a telegraph service.

The Western Canada Power Co. is trying to arrange for the sale of \$1,000,000 worth of bonds in England.

At Edmonton, Alberta, the Edmonton North-Western Radial Railway Co. want to run an inter-urban railway from the city to Pembina River.

Within the last few years a good deal of electrical equipment has been installed in Canadian mines; there is one, that of the Mountain Park Coal Co., situated about 200 miles from Edmonton, which is operated entirely by electricity. Rather more than 500 H.P. of generating plant is now in use.

NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

G.E.C. Extensible Swing Brackets.

THE GENERAL ELECTRIC Co., LTD., of 67, Queen Victoria Street, E.C., have sent us particulars of two new brackets which they have introduced recently. The bracket illustrated in fig. I, which is the subject of a patent (No. 15,607/13), has an extension adjustable between 8 in. and 32 in., with a horiz intal swivelling action within a semicircle; the angle of reflection is adjustable, as shown by the wing nut provided. By means of the curved extension of one of the arms of the lazy-tongs, the light can be raised

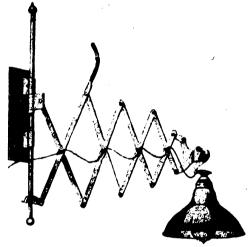

FIG. 1.-LAZY-TONGS EXTENSIBLE BRACKET.

to a fixed point 27 in. above the normal position. The fitting is made of polished brass, and is suitable for use in business offices, drawing offices, &c.

Fig. 2 shows a simple bracket (Patent No. 10,814/13), in which the horizontal arm is telescopic, giving a range for the lamp of from 24 in. to 42 in. By means of the wing nut connection for the lampholder and reflector the angle of reflection can be adjusted. The horizontal arm terminates in a tee-piece specially out away in its lower half, so that the weight of the arm causes the

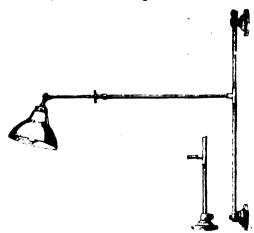

FIG. 2.—TELESCOPIC EXTENSIBLE BRACKET.

tee-piece to grip firmly the upright on which it slides. No binding screws are required, and the arm can be moved instantly up or down or swung round in a vertical plane. Generally one wall plate only is necessary, but if the up and down travel desired is long, additional rigidity can be secured by the use of a top wall

plate. This bracket may also be used as a fixed standard by changing the position of the base-plate, as shown in the illustra-tion. "Superlux" enamelled steel reflectors and Osram lamps are recommended for use with these brackets.

Ironclad Distribution Fuseboards.

MESSES. SIEMENS BROTHEBS & Co., LTD., Woolwich, have recently put on the market some fuseboards specially designed for power distribution purposes in large works where it is becoming

general practice to use ordinary multicore lead-covered paper-invalated cables for motor and other circuits.

These boards are designed with detachable trifurcating boxes, which can be fitted either above or below the board. Each main fure-box is arranged for two three-phase circuits and forms with

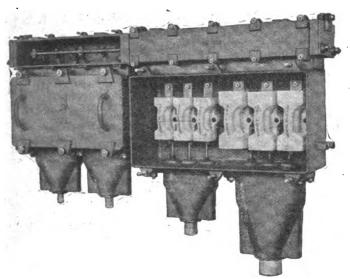

FIG. 3.—IRONCLAD DISTRIBUTION FUSEBOARD.

its bus-bar chamber and dividing boxes a complete unit. The bus-bar chamber ends are covered with plates, the special feature of this arrangement being that additional sections can be added to either end, and extensions made at any time. The bus-bars are of copper tube and are also easily extended. The fuses are of the Home Office porcelain shrouded type, and liberally designed for

Details of these fuses are shown in the firm's catalogue No. 521, which will be sent on application.

"Presto" Hand Lamp.

THE FULLER ACCUMULATOR Co., LTD., of Wick Lane, Bow, E, are placing on the market the "Presto" electric hand-lamp, which we illustrate in fig 4. This lamp has a neat parabolic nickel-plated reflector and a bull's-eye lens, and is fitted with a high

FIG. 4.-TYPES OF "PRESTO" HAND LAMP.

efficiency; metal-filament bulb, and attached by means of a swivel bracket to an ordinary dry cell or portable accumulator, as shown. A convenient carrying handle is provided, and a lamp switch at the back of the reflector. Lamp and dry cell complete weigh 5 ounces.

Simplex Radiators.

In a new electric heating list recently issued by MESSES. SIMPLEX CONDUITS, LTD, of 116, Charing Cross Road, W.C., a variety of luminous radiators and convectors is illustrated, the

former having from one to six lamps. Fig. 5 shows a handsome pattern in gilt brass. A special feature of these radiators is the wiring between the switches and the lampholder, which is carried

FIG. 5.—SIMPLEX RADIATOR.

to convenient screwed terminals in the base. The convectors operate on the Simplex strip system, the resistance ribbon being wound on mica plates, and the whole enclosed in a steel frame.

LEGAL.

SEEAR v. GENERAL ACCESSORIES Co., LTD.

In the Shoreditch County Court on Thursday, before his Honour Judge Cluer, a custom of the trade was pleaded by a plaintiff, under peculiar circumstances. The plaintiff was Elwin Chas. Seear, trading as Mesars. Seear, Page & Co., London, E.C., agent for manufacturers of electrical accessories, and he sued the General Accessories Co., Ltd., London, E.C., manufacturers of electrical fittings, to recover £26 12s. 11d.

fittings, to recover £26 12e. 11d.

Mr. Hicks, barrister, appeared for the plaintiff, and Mr. R. S.
Barnes was counsel for the defence.

COUNSEL explained that the order was for 100 gross of wooden blocks for electrical fittings. It was a custom of the trade to supply these in bags, when unfinished, but if finished in imitation walnut, teak, or white enamel, then they were in cases or boxes. Usually the unfinished sold at 5s. to. 5s. 6d. a gross, and the finished at from 7s, to 7s. 6d. At no time before the war were these sold at less than 6s. a gross, finished, and therefore defendants could not have imagined them finished at 5s. 3d. a gross.

JUDGE CLUER said at the moment he could not agree with that contention, as plaintiff was anxious to sell, as he sent out a circular to that effect, and the defendant might reasonably think the had got a bargain. The original circular of the plaintiff had the word "unfinished" in it, but a bad copyist had left that out, That might have been a mistake, but, taking himself as an example, he should have expected to get the finished article.

MB. HICKS: My contention is, that if the defendants had not

known positively at the time that they were unfinished they would known positively at the time that they were unnushed they would have asked the colour. As to the circular, I know I have to stand by it, but bags are invoiced. I rely on that as a custom of the trade, and because no one in the trade would dream of getting the finished article at 5s. 3d., the price of these.

JUDGE CLUER said they were called "Round, recessed wood blocks," and in law that meant the finished article. What surprised him was that when a blunder had been made by a clerk the plaintiff chose to go to law about the matter.

PLAINTIFF, in his evidence, said that he had never sold at such

PLAINTIFF, in his evidence, said that he had never sold at such

a price as 5 . 31.

JUDGE CLUEB said it was clear that a mistake had been made, and he would have taken them for finished himself. His verdict would

be for the defendants, with costs.

The costs of expert witnesses, in the electrical trade, who were to have been called to prove the custom of the trade, were allowed to the defendants.

BRITISH THOMSON-HOUSTON Co., LTD., v. DURAM, LTD.

In the Court of Appeal on February 4th, before Lords Justices Buckley and Pickford, the hearing of the plaintiffs' interlocutory appeal in this pending action against an order of Mr. Justice Neville for discovery took place. In the action the plaintiffs claim an injunction restraining the defendants or their servants from infringing the plaintiffs' Letters Patent No. 21,513* of 1906, and No. 17,722 of 1911; damages, or at plaintiffs' option, an account of profits, and the delivery up of articles or things made in infringement of the letters patent. The plaintiffs claim to be the regis-

tered legal owners of the letters patent for an invention of processes and apparatus for the treatment of metallic tungsten and for the manufacture of electric lamp filaments therefrom, and also of Letters Patent No. 17,722, granted to John Thomas Henry Dempster for improvements in methods of wire drawing.

Dempster for improvements in methods of wire drawing.

The defendants do not admit that the plaintiffs are the registered legal owners of the letters patent in question. The defendants, under Sec. 25, Sub-Sec. 2 (b) of the Patents and Designs Act, 1907, rely as a defence upon the fact that all the processes and manufactures described and claimed in the specifications filed on application for the Letters Patent 21,513*, 1906, are, and have since the date of the letters patent been, carried on mainly outside the United Kingdom—that is to say, in the United States of America by the General Electric Co., of Schenectady, in the State of New York; by the Westinghouse Electric and Manufacturing Co., of Pittsburg, in the State of Pennsylvania; by the Franklin Electric Manufacturing Co., of Hartford, in the State of Connecticut; in Germany, by the Allgemeine Elektricitäts Gesellschaft, of Berlin; by Siemens & Halske Aktien Gesellschaft G.m.b.H., of Berlin; and in Holland by the Pnilips Metallic Glow-Lamp Works, Ltd., of in Holland by the Pailips Metallic Glow-Lamp Works, Ltd., of Eindhoven.

MR. WALTER, K C., for the appellants, said the point raised was a very important one. The plaintiffs could not be attacked through people over whom they had no control. His c'ients knew nothing about the firms mentioned by the defendants, and had no nothing about the firms mentioned by the defendants, and had no means of ascertaining anything about them. The order made by the Controller that a patent must be proved to have been mainly or exclusively used abroad, was not sufficient. The order of Mr. Justice Neville meant that the whole of his clients' branches relating to their manufactures were to be open to rival traders.

LORD JUSTICE BUCKLEY: Do you go so far as to say that a defendant, before he can have a general order for discovery, must call witnesses to make out a primâ facie case as to the manufactures abroad?

factures abroad?

MR. WALTER said he did, and that was what Mr. Justice Parker had held. No one was entitled to have a roving permission to inquire into a man's affairs.

LORD JUSTICE PICKFORD: You must base your appeal on the

ground of oppression.

MR. WALTER said he did. A general order for discovery was far too wide. The order should be limited or restricted.

MR. T. TERRELL, K.C., for the respondents, submitted that the order was a proper one and was necessary for his clients to prepare their defence.

LORD LICENSE P.

LORD JUSTICE BUCKLEY said there appeared to be two actions. One was for the infringement of a patent; the other was how much business had been done in this country and other

MR. TERRELL said they could not be called two actions. He did not ask that the plaintiffs should disclose all their books. What he wanted was the disclosure of any documents in their possession showing what they manufactured in this country, and how much they imported from abroad. He added: We know what we are fighting about. The plaintiffs have been importing these goods and not manufacturing them.

MR. WALTER: So you say.

MR. TERRELL: I have a right to make that statement. I do not ask for the names and addresses of their customers. covery be limited to quantities. If that is oppress Let the dis-If that is oppressive, then discovery is oppressive in every case.

LORD JUSTICE BUCKLEY said the defence as to foreign manufactures was in the nature of a counterclaim. It was surely more

than a mere defence.

MR TERRELL: It is a defence the Legislature thinks should be allowed in the public interests.

B. WALTER declared that the defendants' interrogatories were fishing ones. Perhaps he would have to apply for discovery to ascertain the extent of the defendants' trade.

MR. TERRELL: I will give you that now. I say the number you manufacture in England is infinitesimal compared with the

quantity imported. LORD JUSTICE BUCKLEY asked if an order for discovery as to what the plaintiffs directly or indirectly imported, and what they themselves manufactured, would be agreed to.

MR. WALTER objected.

LORD JUSTICE BUCKLEY, after further argument, said that, in his opinion, the two matters in dispute were totally different and distinct. One arose merely in an ordinary action for infringement; tinct. One arose merely in an ordinary action for infringement; the other was very different, raising a point as to foreign manufactures. The latter was a defence that might succeed, notwithstanding that the patent was a perfectly valid one, because the defendants said that under the Statute the plaintiffs were not entitled to any relief. The defendants claimed that they could not be proceeded against successfully if they could show that the patented article was manufactured, or its manufacture was carried on, mainly or exclusively, outside the United Kingdom. The question, he thought, was how far the order for discovery should go; there were alternative courses which might be suggested, but he did not think they would be convenient. He considered that a modified order would meet the case. There would, therefore, be an order for discovery of all documents in the possession or power of the plaintiffs in the usual form relating to all goods imported directly or indirectly by the plaintiffs from the session or power of the plaintiffs in the usual form relating to all goods imported directly or indirectly by the plaintiffs from the firms and companies mentioned; and discovery of all documents in the possession or power of the plaintiffs showing the amount of manufactures of the plaintiffs in this country, but in all cases without disclosing the names of customers. That, said his Lordship, could not be called oppressive. Lord Justice Pickford

ELECTRICAL VACUUM CLEANERS' INFRINGEMENT ACTION FAILS MR. JUSTICE WARRINGTON, in the Chancery Division on Thursday February 4th, gave judgment in an action brought by G. Scammell and Nephew, L'd., Fashion Street, Spitalfields, against the Galeworthy "Otovacum" Co., Ltd., Newman Street, W., and the Sturtevant Engineering Co., Ltd., Queen Victoria Street, E.C., for an injunction to restrain the defendants from infringing plaintiffs' trade mark "Otovacum," and from passing off defendants' electrical turbine vacuum cleaners as the plaintiffs' goods.

The defendants denied the allegations. The Galeworthy Co. said that the right to use the word "Otovacum" as part of their title, and also the right to sell "Otovacum" cleaners, was transferred to them by the original company, and onsequently they were entitled to say that they could get such cleaners made by the Sturtevant Co. so long as they told their customers that fact. IB. JUSTICE WARBINGTON, in the Chancery Division on Thursday

fact

His LORDSHIP said the answer to the plaintiffs' claim that their trade mark had been infringed was that they were not entitled to the trade mark at all, because the company in whose name it was registered never transferred or assigned it. The Sturtevant Co. had registered never transferred or assigned it. The Stirtlevant Co. has contended that they had acquired the right to make the cleaners for the Galsworthy Co., and he thought that was so. As to the claim of "passing off," his Lordship said that "passing off " meant representing to a person that the goods one was going to sell were the goods of somebody else. Such a claim in the present case broke down. The first defendants were entitled to use the word "Otygonym" in their title and the action was dismissed with broke down. The first defendants were entitled to use the word "Otovacum" in their title, and the action was dismissed with costs.

STOLZ ELECTROPHONE Co. (1913), LTD.

In the Chancery Division last week Mr. Justice Eve heard an action taken by Mr. W. H. Adams, claiming a declaration that a prospectus of the above company, issued in June, 1913, contained mis-statements of material facts by which he was induced to subscribe for 400 £1 shares. After several days' hearing his Lordship, who described the case as a deplorable one, gave judgment for the plaintiff for £300, with interest and costs.

THE RONTGEN SOCIETY.

Ar the meeting of the Rontgen Society on February 2nd, a paper was read by Mr. Sidney Russ, D.Sc., on some measurements of radiation he has been conducting on the new Coolidge and other X-ray tubes in clinical use. Mr. Russ was appointed by the Dosage Committee of the Society to find out whether the radiation emitted from X-ray tubes running at the same spark gap in various London hospitals was essentially similar and to what extent any differences were important. Several electroscopic measurements were made, and while two out of the four tubes examined were similar in the character of radiation emitted, the others were wholly dissimilar from each other and from the other two. The reason for the large differences was not apparent, but Mr. Russ suggested as worthy on that of the two bulbs showing the widest variations, one was fitted with a light anode which soon became red hot, and the that of the two bulbs showing the widest variations, one was fitted with a light anode which soon became red hot, and the other had a heavy anode, which was kept cool by a metal radiator. The radiation from the former was very soft, and from the latter very hard. The Coolidge tube, which is a new departure in X-ray tube construction, owing to its high degree of exhaustion and to the fact that its cathode consists of a tungsten spiral which is raised to a white heat by means of a current from a few storage cells, has proved, according to the experiments of Dr. Russ, to have radiation of a heterogeneous character, and to show variation in character, but not considercharacter, and to show variation in character, but not considerable, with any alteration of the heating current. The yield of X-rays with this tube was largely increased by a small increase in the heating current, and this increase was relatively larger in the "hard" than in the "soft" radiation.

In the course of the discussion, Professor A. W. Porter in the "hard of the discussion, Professor A. W. Porter in the course of the discussion of the properties with

suggested that possibly the difference between the results with regard to the homogeneity of the rays emitted by this particular Coolidge tube and the results published by Mr. Coolidge himself might be due to the fact that the tubes which were being put on the market commercially in this country had not had the air so thoroughly removed as Mr. Coolidge removed it.

Dr. Finzi, giving his personal experiences of the tube, said that if only care were taken to have a current of air round the tube enormous currents could be passed through it without

dangerously overheating the glass.

dangerously overheating the glass.

Mr. Duddell, referring to some experiments which Dr. Russ had made, utilising selenium as a basis for the measurement of X-ray energy, said that he had been surprised to learn that anybody had produced selenium which was definite in action. He had himself spent a great deal of time in trying to find selenium which was definite in action, but it always varied. Ordinary selenium, he found, varied in resistance from year to year, and finally gave up work.

Mr. Russ said in reply that the selenium he had used had been registering for a few months, but this was not very long to go, and he was anxious to see how its resistance did vary with time.

THE ENGINEERING TRADE AND THE PRESS.

The Engineers' Club of Manchester recently debated the above subject. The matter was opened by Mr. Frank Nasmith, editor of the Textile Recorder, and an abstract of his remarks

appears below.

appears below.

After demonstrating the difference between the daily and technical Press in their relation to the trade, Mr. Nasmirm said that the total number of technical trade journals published regularly during 1914 dealing wholly or partly with the engineering industries was 97; of electrical journals alone there were published no less than 20, a considerable proportion of the whole. The list given includes trade journals published in relation to such branches of the industry as are concerned in buildings, railways, general engineering, gas engineering, ironmongers, mining, textile and timber. It will, however, he gathered from the figures given that the engineerengineering, ironmongers, mining, textile and timber. It will, however, be gathered from the figures given that the engineering industries are well catered for as regards technical literature, and when one adds to the foregoing the occasional pages—and supplements—of our better class daily papers, it will be gathered that much information of a varying degree as regards value is published throughout the year.

Now, as regards the value of a technical trade journal to the engineering industry. The following leading heads may, it is thought, be said to cover the field:—

1. The diffusion of knowledge

The diffusion of knowledge.

Record of interesting events, changes, etc. The direction of public opinion. Means of advertising new methods and machinery.

The ventilation of grievances. Source of information in query form.

Dealing with the different heads the technical trade Press provides the only means for publishing certain matter which otherwise would never be placed on record. The advertiser whom some of us pretend to ignore, but without whom we cannot live—does not only get the presentation of his advertisement to a large body of directly interested people among whom are a number of potential buyers, but he also helps to carry on a noble educative work, and is therefore a philanthropist in diagning.

disguise.

disguise.

The successful journal as a rule enjoys a wide circulation, and in many cases a much wider reading public. The assiduity with which some members of the Club scanned the new contracts and invitations to tender columns of technical trade journals was referred to. At the same time, it must be agreed that a deal of matter which would otherwise remain unpublished is distributed to the right quarters by our technical trade Press. Information on all topics relative to the engineering trade, critical and analytical articles by experts, descriptive matter about new plant and undertakings, abstracts of the more important patents, innumerable notes, etc., etc., all go to make up the weekly or monthly issue of the standard engineering journals. The technical Press extending, as it does, now over many years, forms a record of engineering progress of a quite invaluable kind. Even a hasty perusal of the pictures alone in the back numbers of some of engineering progress of a quite invaluable kind. Even a hasty perusal of the pictures alone in the back numbers of some of our leading journals will demonstrate the rapid strides we have made and the way we have reached our present advanced position. As a means of reference old volumes of engineering journals should be more frequently consulted, and if they were it would be found that many so-called new ideas were tried—and often discarded—years ago. In patent actions the engineering journal often plays an important part, and cases have been lost through a careful perusal of early issues.

As a means of bringing before potential buyers new ideas in machinery, the technical trade Press is pre-eminent. The engineering editor of the daily Press in the main holds himself aloof from the mere descriptive matter relative to a new machine, which usually finds a ready place in the pages of the majority of our technical trade Press. He—the daily Press expert—is precluded from mentioning the maker's name, and

expert—is precluded from mentioning the maker's name, and naturally the maker, looking for a little cheap advertisement, cannot see the value of a description without his name attached to it. At the same time, one cannot but think harshly of those journals which publish what are technically known as "puffs." Unless the new or the improved machine known as "puffs." Unless the new or the improved machine possesses novel features, a description of which will interest and educate the reader, an editor should not be asked to insert a notice. A practice which I have always deprecated and looked upon with disgust is for the literary matter to follow the advertising, or, to put it in plainer words, for the advertising canvasser to dictate what the editor shall insert. The better class journals would rather lose advertisements than pursue such a practice. To come back to our particular than pursue such a practice. To come back to our particular head. It will be generally conceded that the technical trade Press do provide the potential buyer with information relative to new machinery and enable him to keep abreast of times which are often extremely rapid.

The technical trade Press, especially where journals have been established for a number of years, has at its command a remarkable fund of information, and as this is at the command of enquirers, it performs a very useful work as a technical

mand of enquirers, it performs a very useful work as a technical

information bureau.

"There is one thing the technical trade Press suffers fromand unfortunately, from our point of view, it is growing—that is what I may term subsidised competition. It is no use burking the fact that we all live by our advertisement revenue, and although it can be clearly proved that a well established journal gives good value for the money paid for advertising space, the fact remains that firms support Association journals that have a comparatively small circulation. Such journals publish—in the great majority of cases—only reprints of papers and do not give the great mass of useful and general information contained in the high-class technical trade journal. Noting firms only set aside a certain sum yearly for advertising purposes, and if these subsidised journals get a share there is naturally less for the independent self-supporting journals. In a way such competition is unfair, and in my opinion no journal should be published by any parties who are directly concerned in the trade amongst which it circulates."

CORRESPONDENCE.

Letters received by us after 5 PM. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our poss scion.

The British and Overseas Trade.

The long and interesting letter from the New Zealand correspondent in your current issue commends itself to me particularly as it endorses, almost word for word, my letters on the same subject which you were so good as to publish from September 7th last and onward.

It has occurred to me that if the Colonials care to bother with the matter (for the last time, perhaps), a final shot might be made at our home manufacturers by important Colonial buyers, after due consideration, issuing a declaration as to what British firms must do and conform to in order to retain a fair share of Colonial business. Make the declaration mandatory and very definite in tone, and give the Britisher, say, one year from the close of the war to speed-up, get efficient and modernise. The Press (both technical and lay) would, I feel sure, give the matter wide publicity here, and the importance of the movement might be further driven home by pointing out that Canadians have largely gone over to American and German goods (the latter, of course, before the war), and Australia in due course will, as things are going, be forced to do the same. The Colonials would have to avoid making the declaration through any of the big trade associations here, as these strange organisations seem to be taken up with proceedings which are the negation of the most embryonic intelligence, or if they miss this development they are so slow that they only figure as useless and costly babblers. What are needed in respect to the overseas business are actions which correspond to assertions.

I would like to add that the much appreciated space which you afforded some of us for the discussion of "Advertising and Character" received a very wide publicity apart from your influential journal, as the opening of the subject was alluded to in The Advertising World for January, while the Advertisers' Weekly for January 23rd reproduced the major part from your insue of the 8th, adding a favourable editorial comment. As I know from much experience what an important part genuine publicity work plays in the opening up and development of overseas trade, I may be excused for this apparent digression. Colonial buyers, after due consideration, issuing a declaration as to what British firms must do and conform to in order to

apparent digression.

Arthur Mallord Turner.

London, S.W., February 8th, 1915.

Electricity Supply on the Large Scale.

I have perused with interest your leading article on the lecture by Mr. Charles H. Merz to the students of the Institu-

lecture by Mr. Charles H. Merz to the students of the Institution of Electrical Engineers, in your issue of February 5th.

If it is a fact that the inter-connection of large adjoining areas for the purpose of supplying electricity is "essential to reliability combined with economy," the economy is not apparent to the shareholders of the companies operating on the North-East Coast, with which Mr. Merz is closely identified. The commercial results after eight years' working of one of these groups of businesses are not a penny dividend to the ordinary shareholders, plus £58,000 arrears of preference dividend, besides a loss of some hundreds of thousands written off capital account in 1910. It is unfair to your readers that you should give an impression of successful development that has not been achieved, so far as the North-East Coast supply of electricity in the Cleveland and Durham area is concerned.

The group of electric power companies operating on the North-East Coast exercise large Parliamentary powers, but they evade Parliamentary obligations regarding the publication of statistics. If these companies would frankly publish, as all the London electric supply companies and all municipal

as all the London electric supply companies and all municipal electrical authorities do, their statistics as to working costs per unit, price received, total units sold, etc., it would be more useful to the consumer, the investor, and the general public, whom the Electric Lighting Acts were meant to protect, than any startling figures Mr. Merz may give to a meeting of students when there are no means of verifying the

statements made.

Could Mr. Merz explain why the results of the Cleveland and Durham group of power companies have been so disastrous to the shareholders under the waste-heat scheme and the inter-connection of large areas, and why the profits have been so very far short of the profits which were estimated to accrue without waste-heat?

The success of any particular system of development of an electricity supply undertaking and the reliability of its service to the public cannot be assured by any logical process that leaves out of account the question of commercial result and financial stability. In fairness to your readers I ask the insertion of the letter in result in the letter. financial stability. In fairness to yo insertion of this letter in your journal.

Andrew Gemmell

(A Shareholder).

Ovingham-on-Tyne, February 8th, 1915.

A.C. v. D.C. for Lighting.

I have great pleasure in replying to Mr. Hall and to Mr. Wardle regarding the question of A.C. versus D.C. for lighting. I note their comments to my letter on this matter in your

issue of February 5th.

Mr. Hall states that the source of supply does not determine the number of live wires which one has to con-

termine the number of live wires which one has to contend with, say, from a distribution panel or box. There is a considerable difference between a three-phase distribution panel and a three-wire D.C. panel, which he will probably find out for himself at some future time if he comes to deal with the sources of supply I have mentioned.

He seems to be under the impression that an earth return means a return by earth itself, as, for instance, in magneto, or battery call, telephone earthing; such, however, is not the case in lighting or power work, in which the return conductor must be insulated if carrying above five amperes, B.O.T. regulations. The fact that he is under this impression is verified in his statement, that if an earth return is used, which is rather unsatisfactory (he here makes no mention of the three-wire D.C. system) the low-voltage alternating current would be less troublesome than the D.C. current of electrolytic propensities.

propensities.

would be less troublesome than the D.C. current of electrolytic propensities.

Regarding the cost of installation of electric lighting, Mr. Hall will some day have the fact brought home to him, perhaps rather unpolitely, that cable costs money. No matter how small the installation may be, the firm who employ him expect him to use discretion in the matter of cable. With due regard to mechanical strength of cables, this point is governed by the method of wiring adopted, and only in such places where the cables are exposed, and liable to be much bandled, or repeatedly moved about whilst loaded with current, need the question of mechanical strength be taken into consideration. In ship repair work, or on large plant work where temporary cables are slung about anyhow and regarded more or less as so many ropes, the doubling of the ampereage by the halving of the voltage is a serious point which must not be overlooked when taking into account their selection, having regard to capacity and strength.

I wonder what gave Mr. Hall the impression that my experience had been with the older squirted filament lamps, and not with the modern tungsten drawn-wire lamps also. I can assure him that I remember the introduction of both types of wire lamp, and have used a few of each during past years.

ence had been with the older squirted filament lamps, and not with the modern tungsten drawn-wire lamps also. I can assure him that I remember the introduction of both types of wire lamp, and have used a few of each during past years. I certainly did not say in my letter of the 29th January that the drawn-wire lamps were extremely fragile.

He seems to be under the impression that the filament of the 110-volt lamp is of a greater diameter than that of the 230 to 250-volt lamp. During my experience I have not noticed any difference in the size of the filament in the respective lamps I have just mentioned. I paid particular attention to this point whilst inspecting the construction of drawn-wire lamps at our largest lamp works in London about a month ago. Traction or supported-filament lamps are made in any voltage as required. The thickness of the filament is only increased as the candle-power is raised and the size of the bulb enlarged. I was unaware that I had attempted any hedging in my letter, and, although I mentioned accumulator charging as being in favour of D.C. supply, I did not expect it to be made a point of argument by Mr. Hall. Perhaps he will tell us what he means by the phrase "general handiness for lighting purposes."

It is, of course, only natural that electricity supply companies, for whom I take it our friend is working, should endeavour to push A.C. lighting. Most Corporations now generate high-tension three-phase current which is transmitted to the outlying sub-stations to be converted to working pressures for local distribution. Apart from the expense of running rotary converters to obtain D.C., there is the difficulty of generating H.T. D.C. Static transformer losses are very small, hence the advent of A.C. supply for lighting and power. Experience with both classes of current enables me to speak with some slight knowledge of their respective merits.

Re Mr. Wardle, I am pleased to say that I quite agree with him as to the feasibility of the bonded earth return of the A.C. lighting circui

the arc. If, however, the fourth or earth wire be also insu-

the arc. If, however, the fourth or earth wire be also insulated the danger is lessened accordingly.

The system of supply mentioned by Mr. Wardle means that instead of the supply being across two phases of a three-phase transformer, he is across one phase only and one earth conductor, which eventually terminates at the centre of the star connections of a three-phase alternator stator. As the B.O.T. regulations compel the supply company to insulate the earth conductor of the mains leading up to a building, it seems strange that they should overlook the bare sheathing return which, if ruptured, would cause an arc and probably a severe burn out. I should fancy this is a point for insurance people to deal with. It is evident that you could not use such a system for power or heavy lighting circuits above five amperes. Private plant power and lighting is always across two phases, and not one phase and earth. At least, this has been my experience personally, and also what I have noticed on other plants.

Hoping that Mr. Wardle will treat my reply to him in the same spirit as I have received his, and that my letter may be instructive to other readers of the "E.R."

Henry Fowler,

Electrician-in-Charge.

Liverpool, February 6th, 1915.

Street Lamps in Chicago.

In the October 9th, 1914, issue of the ELECTRICAL REVIEW (London), page 504, under the heading "Notes," there was an abstract of an article in the Electrical Review and Western Electrician (U.S.A.), entitled "Half-Watt Street Lamps From Chicago." I wish to call your attention to a serious error in this abstract. In the last paragraph, a statement is made as follows:—

this abstract. In the last paragraph, a statement is made as follows:—

"The arc lamps which are to be replaced are 450-watt flame type arcs numbering some 10,000 which were adopted as a standard rather more than two years ago."

If you will refer to the last paragraph on page 512 of the original article in the Electrical Review and Western Electrician on September 12th, 1914, you will note that the gas-filled lamps (so-called half-watt lamps) are to replace 10-ampere direct-current open arcs and 7-ampere alternating-current enclosed arcs, the enclosed flame arcs remaining as installed. Such errors are inexcusable. installed. Such errors are inexcusable.

> S. C. Rogers, Arc Lamp Eng. Dept., G.E.C.

West Lynn, Mass., January 9th, 1915.

[We may remind our correspondent that a sentence simultaneously appeared in the leading columns of our contemporary, which reads as follows:—"The most striking feature of the Chicago installation with the new 300-watt lamps is that they will be used as a standard unit in place of the 450-watt flame arcs that were adopted a little over two years ago and of which some 10,000 have been put in service." The article in question set forth the merits of the 600-c.p. half-watt lamp as against those of the flame arc describing experiments carried question set forth the merits of the 600-C.P. half-watt lamp as against those of the flame arc, describing experiments carried out in Chicago to the advantage of the former; we regret that the paragraph quoted by Mr. Rogers was overlooked, but in view of the strong editorial comment of our contemporary which we reproduce above, and the tenor of the whole article up to the last paragraph, we feel that our impression was not unjustifiable.—Eds. Elec. Rev.]

The City and Guilds Exams.

I have had my attention called to the fact that the City and

I have had my attention called to the fact that the City and Guilds of London Institute, in its examination papers on electrical engineering, is still asking questions of this type:—You have N cells, each with an electromotive force of e volts and a resistance of r ohms. How would you arrange them, S in series and N/S in parallel, so as to make them send their greatest possible current through an external resistance of X ohms?

And, as the rule taught even in the latest text books could nonly give a correct answer by accident, perhaps you will allow me to state the following very easy rule of my own, which is demonstrably good for every case:—

Let A be a smaller number than B. Then S = A will give a smaller current than S = B, if A B is smaller than NX/r;

but not otherwise.

If your readers will try this with N=14, X=1.4 and $\tau=1$, they will find that it gives them the right grouping with even less trouble than the usual rule gives them the wrong one, and that the increase of current with my rule is over 20 per cent.

For a demonstration that my rule must hold good in every case, I must refer your readers to my pamphlet on the Grouping of Electric Cells.

W. F. Dunton.

Newcastle-on-Tyne, February 4th, 1915.

Electric Lighting Authorities and the Law of Rating.

I have read with much interest the recent article in your columns on "Electric Lighting Authorities and the Law of

Your contributor states the matter fairly clearly except in regard to the portion referred to as "tenant's share." He explains what this item means, but adds that "it would not, of course, include the value of the boilers, engines, dynamos or other fixed machinery at the central station," and I cannot the state of t or other fixed machinery at the central station," and I cannot trace throughout the figures that any percentage whatever is taken in regard to capital cost involved in the works. I was always under the impression that some percentage of the capital cost involved was allowed, the amount varying with the age of the plant and the loan period.

I should be glad if your legal contributor could give a little more explanation on this point.

Fredk. W. Purse,

City Electrical Engineer.

Carlisle, February 2nd, 1915.

Carlisle, February 2nd, 1915.

The statement in the article referred to that the tenant's share would not include "the value of the boilers, engines, dynamos or other fixed machinery at the central station" was founded upon the decision in R. v. Lee (1866), L.R.I.Q.B., 241. According to Mr. Ryde in his "Law of Rating," p. 279, that case decides that in arriving at tenant's capital, the hypothetical tenant must be supposed to provide "all the necessary stock-in-trade, coals, tools, and loose machinery necessary for carrying on the business. These include (in the case of a gas company) the meters placed on their customers' premises, but company) the meters placed on their customers' premises, but not the retorts, purifiers, steam engines (used for driving machinery and fixed by screw-bolts), boilers or gasholders, all of which are valued as enhancing the value of the freehold.

of which are valued as enhancing the value of the freehold."
It is true, as stated by your correspondent, that no deduction for the tenant's capital is specifically mentioned, but it is included in the item "Tenant's share 17½ per cent. on £51,000." referred to in the table of figures headed: "Ascertainment of Rateable Value," which appeared in the article. According to Mr. Ryde (loc. cit. p. 280) "The hypothetical tenant must also provide sufficient capital to carry on the business until he receives enough money from that business to meet the current working expenses including (inter alia) the rates."

As to there being any deduction on account of "capital cost,"

I do not know of any such deduction being allowed.

The Writer of the Article.

The Acquisition of Enemy Patent Rights.

A very interesting aspect of the relative trades of the United Kingdom and enemy countries is offered by the statistics of firms or individuals to whom British patents have been granted in recent years. In 1911, for instance, out of the 17,164 fully granted British patents of that year, it is surprising to see that 2,886 were granted to residents of Germany, and 325 to residents of Austria. esidents of Austria. Nearly a fith of the patents of the nited Kingdom have in recent years been passing into the

In many cases the articles or processes controlled by these enemy patents are manufactured or carried on mainly or exclusively abroad, the British patents being used merely for the purpose of closing the English market to persons other

than the patentee.

In 1907, a strenuous effort was made to compel foreigners In 1907, a strenuous effort was made to compel foreigners to manufacture in this country the articles protected by their British patents. As you are aware, the law was to the effect that anyone could apply for the revocation of the patent on the ground that the patented articles were being manufactured mainly or exclusively abroad. This effort has not by any means given the results which had been desired. It is surprising to find that throughout the four years next subsequent to the commencement of this law, i.e., until December, 1911, only 81 applications for revocation were lodged. Out of these, 42 applications were abandoned or dropped owing to expire 42 applications were abandoned or dropped owing to expiry of the patents. On the whole, during the period referred to, there were only some five patents per annum actually revoked for non-compliance with the law.

there were only some nive patents per annum actuarly revoked for non-compliance with the law.

Upon the commencement of war, new and practically unprecedented conditions arose. It became substantially a physical impossibility for the German patentees to continue to import their patented articles into this country, and in the large number of cases in which no British manufacture had been commenced. British subjects were wholly unable to obtain these articles, and they were, furthermore, unable to manufacture, as the patents still in fact existed and remained the property of the enemy proprietors.

An emergency law was, as you are aware, very soon introduced, the result of which now is that any British manufacture can apply to the Board of Trade for the right to manufacture under any enemy patent. The right is granted in the form of a personal licence, and it is now definitely established that the British manufacturer will not be deprived of his right to manufacture upon the termination of hostilities.

That the emergency law is of far greater value than the 1907 law is proved by the fact that throughout the past few months of war, and notwithstanding the adverse circumstances existing as a result of the war, there here been 2012 applications for

law is proved by the fact that throughout the past few months of war, and notwithstanding the adverse circumstances existing as a result of the war, there have been 248 applications for this right to manufacture, as compared with the 81 applications which were made throughout the four years following the introduction of the 1907 law.

An obvious reason for the enhanced value of the emergency An obvious reason for the enhanced value of the emergency law is that it confers a certain degree of monopoly in favour of the one applying for the right to manufacture. The entire revocation of the patent, as in the practice under the 1907 law, has the disadvantage that the applicant for revocation, after having gone to the trouble and expense of his application, is, when he succeeds, placed only upon the same footing as all other manufacturers in the country. Such other manufacturers are vested with an equal right to manufacture without having contributed to the trouble and expense involved in nullifying the patent.

having contributed to the trouble and expense involved in nullifying the patent.

Having, therefore, in view the merits and advantages of the emergency law, and having in view also the large numbers of valuable enemy patents which are in our midst, it appears eminently desirable that no-time should be lost in taking all possible advantage of the facilities which are offered, as, while the benefits conferred during war will continue to exist after the expiration of hostilities, the opportunity of obtaining them is of duration substantially limited to the period of war.

Lewis Wm. Goold, F.C.I.P.A.

Birmingham, February 6th, 1915.

Consulting "Engineers."

It is curious to note, in most large towns, certain individuals

It is curious to note, in most large towns, certain individuals who rent a small office, fix a brass plate, lay in a stock of stationery, and open out as full-blown consulting engineers.

One such gentleman we have in mind who obtained his engineering training in the manufacture of artificial teeth. Another one was formerly a draper, and so on with other instances that might be quoted.

The most surprising thing is that these persons are occasionally employed by large firms, who, one would naturally expect, would look more closely into the qualifications of those to whom they entrusted their work.

to whom they entrusted their work.

Delta.

February 8th, 1915.

WAR ITEMS.

Copper Enough for Thirty Years!—At the quarterly meeting of the Association of German Ironmasters, held at Dusseldorf on January 31, Dr. Schuster, the secretary, stated that when the stocks of copper in Germany were exhausted the Germans would seize everything made of copper in the parts of Belgium and France occupied by them. (By all accounts they have already been doing so for the past two months.) They would take electric wires, kitchen utensils, fittings from sugar refineries and other industrial works—everything down to the very door-handles. After that, if necessary they would strip Germany of copper, and by taking the metal off the roofs of public buildings and melting down their bronze monuments they would have enough to last them for thirty years. Which reminds us that in the other Thirty Years' War Gustavus Adolphus of Sweden thus addressed the silver statues of the Twelve Apostles he found in a cnurch: "Gentlemen, how is it you are standing here doing nothing? Don't you remember your Master ordered you to go about through the world?" And he promptly melted them down and minted them into dollars.—"Ironmonger." that when the stocks of copper in Germany were exhausted

monger."

Employment of Belgian Engineers.—We read in the "Times" that during the last few weeks a large number of Belgian engineers have been engaged at Messrs. Vickers' works at Barrow. There has been a very big demand for engineers owing to the large Government orders for war purposes, and although a great many additional British workmen were taken on, the supply was insufficient. Arrangements were therefore made to employ a small party of Belgians to begin with, and the experiment proved so satisfactory that others were sent for, and now 900 Belgians are employed by the firm. The greatest difficulty has been to find houses for the men. The engineers so far have shown themselves to be very efficient workmen, although many of them are now doing a class of work differing largely from that which they have been used to. They work very satisfactorily with their fellow British workmen, and arrangements are now being made to introduce Belgians at the works of the Furness Railway Company at Barrow.

Board of Trade Assistance.—The Board of Trade continue to receive a very large number of enquiries for the names of sellers or buyers of articles of which the sources of supply or market have been interfered with by the war. Special arrangements have been made in the Commercial Intelligence Branch of the Board of Trade for dealing with these enquiries, and lists are prepared and circulated of articles which enquirers desire (a) to purchase, and (b) to sell. The cighth list is now ready, and may be obtained by United Kingdom manufacturers and traders. British firms interested in any of the goods mentioned, either as buyers or sellers, should communicate with the Director of the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

Maximum Prices for Metals.—According to a U.S. Con-Employment of Belgian Engineers.—We read in the

Maximum Prices for Metals.—According to a U.S. Consular report, the German Federal Council has issued an order establishing maximum prices on copper, brass, and other

Digitized by GOOGLE

metals. The regulations became effective on December 14. The maximum prices are indicated in the table following, The regulations became effective on December 14. and are applicable to metals marketed within the German Empire: Price per

100 pounds. Refined copper ... £ 4.45 ... 3.22 Scrap brass ... 3.88 7.21 Red brass (gunmetal) • • • • Aluminium 7.2 ... 10.0 Nickel Refined antimony 3.32 11.1 Tin

Trade in Belgium.—Everyone anticipates that when the war is over Belgian manufacturers and merchants will give preference to trade with the Allies, indeed, we have already had ample evidence to that effect. We are now informed that some influential Belgian business men have taken steps with a view to organising an office called "For Commerce with the Allied Nations," the temporary address of which is c/o London Chamber of Commerce, 97, Cannon Street, London, E.C. Its objects are to secure for well recommended and fully qualified Belgians the agency in Belgian of British firms, and to answer enquiries from Belgian firms who are desirous of replacing foreign goods by their English equivalents. Trade papers, catalogues, etc., are invited and Trade in Belgium.—Everyone anticipates that when the equivalents. Trade papers, catalogues, etc., are invited and they will be filed in order to give all possible assistance to

Anglo-Russian Commerce.—Reuter's agent at Odessa (according to the "Financial Times") says that the local branch of the Anglo-Russian Chamber of Commerce, at a well-attended meeting, discussed the further development of the commercial relations between the two countries. The present time was regarded as a very favourable moment, and it was decided to study questions of railway tariffs, and to reorganise the Chamber, so that it may incorporate the great possible number of members of the British colony interested in trade and industry. The British Consul was elected as

honorary member.

Swiss Aluminium.—According to a Schaffhausen newspaper, the French Government has placed under control of State officials the Marseilles branch of the Aluminium Industry Co., of Neuhausen, Switzerland. A seizure of stocks has not taken place, as no aluminium is reported to have been found on the premises. It is assumed in certain German circles, who are interested in the Neuhausen Company, that the Swiss Federal Council will lodge a protest against the action taken by the French Government in regard to "the French branch of a Swiss undertaking."

Lamps for Malay States.—Before the war the price of a 25

Lamps for Malay States.—Before the war the price of a 25 c.p. tungsten lamp in Kuala Lumpur was never more than 2s. 4d. The Board of Trade correspondent for the Feder-2s. 4d. The Board of Irade correspondent for the recerated Malay States says that these lamps mostly came from Austria, some from the Netherlands, and some were not marked with country of origin. The Netherlands are now furnishing a supply at 3s. 6d. each. It is suggested that British firms have not sufficiently realised the opportunity afforded by the war of gaining a footing in this market.

Salary Advances to Men on Active Service.—The Tramways Committee of the Bradford Corporation have decided that as regards employés in the Tramways Department who are on active service with the Navy or Army, any advances of wages falling due to them under scale shall accrue as usual, notwithstanding absence from work in the department.

Personal.—Sapper Walter Fox, who is in the Naval Engineers of the Colonial Defence Corps at Singapore, was up to a few months ago an electrician in the employ of the Stalybridge, Dukinfield, Hyde, and Mossley Joint Tramways and

bridge, Dukinneid, riyue, and mossicy joint Library, Ltd.

Private M. J. Fox, of the 4th Middlesex Regiment, who was for six years employed in the Rochdale Corporation tramways department, has been awarded the Distinguished Conduct Medal for bravery in the field.

Company Sergt.-Major Thos. Perkins, an employé in the Wigan tramways department, has received a commission as lightenant and transport officer.

Wigan tramways department, has received a commission as lieutenant and transport officer.

Mr. F. C. Locke, of the Anchor Cable Works, a well-krown athlete, has joined the Sportsmen's Battalion.

Private John Brand, of the 8th Royal Scots, who previous to the war was employed at the Dalkeith Electricity Station, made a valiant attempt to save his Captain. Brand dragged the officer, who was wounded, into safety, and after three hours' crawling arrived at the British trenches. Unfortunately the officer expired. Brand has been in hospital suffering from severe strain. nately the officer expired. ing from severe strain.

We recently mentioned that Mr. S. W. Carty had resigned his position as overhead superintendent with the Liverpool Corporation Tramways Department, and had obtained a commission in the Army Service Corps. We now learn that Mr. Carty has not resigned, and his position is being kept open for him by the Corporation.

The following notice appeared in the "London Gazette"

on Tuesday:—
Territorial Force.—London Electrical Engineers: undermentioned Second Lieutenants to be Lieutenants (temporary). Dated January 1st, 1915:—Thomas F. Middleton-Case, George R. Madge, Maurice G. Bland.

Mr. Fred Middleton, electrical engineer, of Park Road, Hadfield, Glossop, has joined the 3rd Southdown Royal

Sussex Regiment.

BUSINESS NOTES.

Consular Notes.—TASMANIA.—Machinery Trade. In reviewing the machinery import trade of Tasmania for the first half of last year, the United States Consul at Hobert notes that in electrical plant and appliances the bulk of the trade was supplied by Germany and the United States, despite the preferential tariff to Great Britain. The United States figured exceptionally in the importation of dynamos, but this trade is irregular, and it may be many years before Tasmania may again be in the market for such a large supply, whilst the considerable imports of general electrical appliances are staple. It is in these latter lines that business should be developed. The United Kingdom made a strong showing in portable engines, and had appreciable success in motor-power machinery, sharing the latter line with the United States. Sweden machinery, sharing the latter line with the United States. Sweden provided about half the total imports in this class. On account of the rapid development of electric power in Tasmania, the sales of such machinery should show a gradual development. Present indications, the Consul says, point to a normal trade in all lines of machines and machinery except those for mining, which industry is stagnant on account of the low price of tin and the entire loss of a market for other products. As was shown in our issue of February 5th, the tariff preference to British manufactured machinery has been increased.

THE RUSSIAN MARKET—In the hope that the seed may

THE RUSSIAN MARKET.—In the hope that the seed may possibly fall on fruitful ground, H.M. Consul-General at Mosco reiterates, in his recently issued report, the oft-told tale of British indifference to local requirements, of the "take or leave" attitude shown by the British manufacturer in many cases where the error of his ways is pointed out by the Consular officer, his own agent, or a prospective customer, all of whom, being on the spot, are much better qualified to judge of the requirements of the market, and the best policy to pursue to meet local and descript compactition.

foreign competition.

Moscow, says the Consul, there is an opening for every class of British merchandise. Even with the high import duties in force British goods can compete in many cases with the locallyforce British goods can compete in many cases with the locallymade and protected article by reason of their superiority, and the
Bussian customer is quite willing to pay an enhanced price for the
best qualities. Meanwhile, on every side, one has seen German
goods. An inquiry for an article of British manufacture will be
met with an expression of regret that it is not saleable in Moscow,
but a substitute has been forthcoming, patently of German origin,
which not seldom bears a description or name in English, generally
misspelt, but, nevertheless, a subtle piece of flattery to the selling
power of the British article, if it were only to be found on sale.

In seeking business in Russia the Consul emphasises the import-

power of the British article, if it were only to be found on sale.

In seeking business in Russia the Consul emphasizes the importance of granting credit. Firms not willing to grant credit for four or six months after the receipt of goods had much better not attempt to enter this market. Their German and French competitors will at once offer such credit as is desired, and the efforts of the British trader will be useless. The request for credit is no captious demand in Russia, but an essential corollary of a commerce carried on in a vast Empire in which railways are few, markets widely separated, and roads bad and often non-existent. The majority of the customers are peasants who can only pay on the realisation of the harvest, and the retail merchant must have credit to allow him to carry any stock. The great question does not however, lie merely the harvest, and the retail meronant must have credit to show him to carry any stock. The great question does not, however, lie merely in the granting of credit, but to whom the credit is granted; and where British merchants and manufacturers are at fault is that they will often grant credit where none should be given, and when once bitten refuse it where it should be granted freely. This state of affairs is due to the imperfect knowledge of Russian conditions. and can only be rectified by the intimate personal knowledge which can be gained by frequent visits of principals or travellers to this

country.

An instance of how not to grant credit may be taken from the following case:—A British firm, wishing to enter this market, applied to the Consulate at Moscow for information as to the standing of an agent who had been recommended to them. Though it was known in the Consulate that the agent bore no good reputation, further inquiries were at once set on foot, which not only confirmed the previous information, but rendered it imperative to warn the British firm most strongly against the man. Disregarding the Consular advice, on the strength of a banker's recommendation the man received the agency. Within six months the British firm lost many thousands of pounds, and have applied to the Consulate to assist them to collect what is due to them.

British manufacturers and merchants must also remember that

British manufacturers and merchants must also remember that in a great trading and manufacturing centre like Moscow, there are many of their fellow-countrymen who by their foreight and adventurous spirit have not only traded with, but established factories in, the district, and whose interests have to be as much consulted as those of any other British subject. Many of these are men of substance and buy for their own account from the United Kingdom, but there are also numbers of others who, though not in sfluent circumstances, are anxious and willing to undertake agencies. These men are generally thoroughly conversant with Russian customs and requirements, and speaking Russian themselves would be most useful to British firms. In order to employ such men it is generally advisable to make some advance or to supply a stock free of charge, and any expenditure thus incurred is generally compensated for by the extra reliability and commercial integrity of such persons as compared with those of another race.

ITALY .- Government Contracts.-The United States Consul at Rome has been actively investigating the openings for increasing American trade with Italy which have arisen since the outbreak

of war. Although many of the opportunities he indicates must be considered as temporarily deferred owing to the depression in business caused by the earthquake, it is useful to put on record his advice with regard to obtaining Government contracts in Italy, as to which conditions are somewhat peculiar. There are certain well-setablished contractors in Rome who have obtained certain well-established contractors in Rome who have obtained Government orders, and it is almost unprecedented for such orders to be placed through other mediums. Apparently, also, the Italian Government will not deal in the first instance direct with actual—at least foreign—exporters and manufacturers, but insists that negotiations be carried on through a local agent; it is also a common experience for the principal to the transaction to receive direct communication from the Government purchasing department over the head of his agent. This is doubtless the reason why local agents demand exclusive representation for such business, in order to protect themselves against loss of commission. It is also customary for the Italian Government to demand a deposit of 10 per cent. of the total value of the order upon signing the contract to insure prompt delivery, and this deposit is returned only upon completion of the contract. It is possible that this onerous condition would now be renounced.

Shortage of Electrical Goods in Spain. — The Fomento del Trabajo National, which was called together to adopt measures to meet the crisis in the electrical goods market, has arrived at certain decisions, which the American Consul at Seville quotes from the Revista Comercial. To carry out these decisions it is proposed to nominate a committee, composed of members of the Association of Industrial Electricians of Cataluna, the Metalunaidal Association of Sanja and other respectively. lurgical Association of Spain, and other representatives of Spanish industries. The proposals are :-

1. To obtain from the Government a tariff reduction on all electrical materials manufactured outside of Spain, by means of a

regulated tariff.

2. To ask the Government to make inquiries through the various ambassadors abroad which country is best able to supply these materials; at what prices, and on what conditions, if for personal account or account of the committee mentioned, which would undertake to supply all Spain.

3. To inform the manufacturers in Spain that in the event of

their needing materials they should inform the committee, which will facilitate their obtaining them and also price lists.

4. To get in touch with the sellers of materials who had offered them at customary prices, secure detailed information regarding these goods, and distribute this information to the industrialists of

5. To ask the help of representatives of foreign houses in ascertaining if their houses can supply materials, and the prices thereof.

New Zealand.—A firm in Wellington wants to add sole agencies for British makers of glassware, electric lamps, and carbons. H.M. Trade Commissioner, P.O. Box 369, Wellington.

Anglo-Norwegian Trade.—The Norwegian Chamber of Commerce, London, Inc., Kingsway Chambers, Kingsway, W.C., has received so many inquiries respecting trade and other matters that it has now published an official organ with the object of fostering trade between England and Norway. A copy of the first monthly issue is before us. It is entitled the Anglo-Norwegian Trade Journal, and contains brief articles on such matters as the inport trade of Norway. import trade of Norway, Norwegian copper imports from America, exports prohibited from Norway, prohibited exports from the United Kingdom, a trade inquiry department, and so on.

Improved Outlook in Argentina.-Consul-General at Buenos Aires reports that the end of November was signalised by an entire change of tone in Argentine commercial and financial circles. The prospects for the immediate future were generally regarded as very reassuring. Notwithstanding decreased foreign trade due to over-speculation and enforced retrenohment, together with poor crop returns, the country is looking forward to the results of the coming crop with a strong measure of confidence. Given nearly rices, the expect was 1914.5 ing forward to the results of the coming crop with a strong measure of confidence. Given usual prices the export year 1914-5 is expected to prove "to be the greatest in Argentine history." Horses alone to the value of \$4,000,000 (300,000 in number) are now being selected for European countries. "The immediate effect of the more hopeful tone in the general market has been already shown in increased banking movements and in a general inclination throughout commercial circles, particularly among importing houses, to make preparations for future business." Another Consul mentions that \$107,000 is eventually to be placed at the disposal of the Ministry of Public Works for remodelling a Government building in Rosario to meet the needs of a local Pust Office. Plans submitted by the Director-General of Architecture Plans submitted by the Director General of Architecture

have been approved.

The U.S. Consul at Rosario reports that a company is in process of formation at Santa Fé for installing and operating light and power plants in the cities and agricultural colonies of the Province. The capital is to be \$424,600, and it is reported that the first of five series of \$84,920 each has already been subscribed. The promoters stated that operations were to be commenced on January 1st, 1915. Communications should be addressed: Sr. Armando Antilla, Gral. Lopez 87, Santa Fé.

Canada.—An Edmonton company already handling certain British electrical lines wants to take up further British agencies. The name and address can be ascertained at the Board of Trade Commercial Intelligence Department in London.

Book Notices .- Lockwood's Builders' and Contractors' Price-Book, London: Crosby Lockwood & Son. Price 4s.—This useful work contains a section on electric lighting, which has been revised by Mr. A. P. Haslam, and includes, besides general information, a number of price lists, mostly under the names of well-known firms. Some estimates of the cost of wiring small installaknown firms. Some estimates of the cost of wiring small installations, as well as of the running cost, are also given. There are some features to which we may take exception: we doubt whether lead-covered wire with paper insulation has any vogue nowadys for house wiring; on p. 380, after an estimate for lamps using 21 watts, it is stated that 20 watt lamps (of the same C.P.) are now obtainable, which enable the charge for energy to be "considerably reduced;" and on p. 390 we read "Geeks" for "Geeko." As a whole, the book contains a mass of information, about one-third of its contents consisting of legal notes, building Acts, regulations &c.

regulations, &c.

Spon's Architects' and Builders' Pocket Price Book (London: E. & F. N. Spon, Ltd. Price 2s. 6d. net) for 1915 has been issued, with revised prices, and, we understand, new matter, though its size remains the same as last year. In the "Electrician" section the only changes discernible are the substitution of metallic-filament lamps in the table on p. 222 for the carbon-filament type, and slight alterations in the table of lamp prices, &c., on the following the table of such prices and slight alterations in the table of lamp prices, &c., on the following the table of such prices and slight alterations in the table of lamp prices, &c., on the following the table of such prices and slight alterations in the table of lamp prices, &c., on the following the table of such prices are the such tables are the such tables are the substitution of mathematical such tables. lowing page. The difficulties experienced by the editor of such a publication at such a time as this must be considerable, when the prices of some materials are subject to rapid change, and he has our sympathy. The book is a very handy one, and convenient for

the pocket.

The Colliery Manager's Pocket Book and Diary for 1915, edited by H. Greenwell (London: Colliery Guardian Co., Ltd. price 2s. net) is in its forty-sixth year of publication, and needs no introduction to our readers. It is indispensable to colliery officials.

introduction to our readers. It is indispensable to colliery officials, amongst whom the electrical engineer now occupies a place of constantly-increasing importance. Special sections deal with the regulations affecting the use of electricity and the duties of those in charge, and there is a mass of general information on all mining questions. It is certainly an excellent publication.

"Journal of the Institution of Electrical Engineers." Vol. 53, No. 241. February 1st, 1915.—This issue contains papers on "The Shape of the Pressure Wave in Electrical Machinery," by S. P. Smith and R. S. H. Boulding; "The Magnetisation of Iron at High Fiux Density, with Alternating Currents," by J. S. Nicholson; and "The Current Transformer," by A. G. L. McNaughton. London: E. & F. N. Spon, Ltd Price 3s. 6d.

Electrical Fires. — The value of the Pyrene fire extinguisher, which was described in our issue of February 20th, 1914, has been demonstrated by its successful use on several occasions at the Bexley U.D.C. electricity works. A fire broke out among the rubber cables of the old H.T. switchboard, which would have led to disastrous results had it not been for the promptness with which the fire extinguisher was used. On another occasion a burn-out took place on a traction generator, and, in this instance, the damage done to the machine was comparatively small on account of the efficiency of the extinguisher. A third instance was a burn-out on a single-phase alternator armature coil, which was quickly put out without finding it necessary to stop the machine, which is one coupled in tandem to the traction generator. The fire extinguisher has also been used on small outbreaks in the workshop and boiler-house, and Mr. H. P. Fires. — The value of the Pyrene fire Electrical trac ion generator. The fire extinguisher has also been used on amill outbreaks in the workshop and boiler-house, and Mr. H. P. Stokes, electrical engineer and tramway manager, expresses himself as perfectly satisfied with the success of the device; he specially emphasises the fact that in no instance has any injury been caused to the electrical apparatus on which the fires have occurred, the fluid used being a non-conductor.

For Sale.—Salford Electricity Committee has for sale two 900-KW. D.C. generators, 410 to 550 volts, coupled direct to six-cylinder compound engines, also a motor-driven boiler feed pump, and a high-pressure steam feed water-heater. Tenders by February 20th. Particulars are given in our advertisement pages

The businesses and premises of Messrs. W. Bryden & Son, electrical engineers, &c., of Edinburgh and Glasgow, are to be sold, together or separately. Particulars are given in our advertisement pages to-day,

The Position of Engineering Trade in Canada. We learn from a correspondent that the war has had a most disastrous effect upon all Canadian business, and especially upon disastrous effect upon all Canadian business, and especially upon engineering developments. A large number of contracts of all descriptions that were in progress before the war were immediately suspended when hostilities began, and they will not be proceeded with until after the winter. The manager of one engineering works in Canada said a few weeks ago that whereas their "wages" and "materials purchased" accounts in normal times averaged from \$90,000 to \$100,000 per month, at the present time these accounts were less than \$4,000 per month! As it is of course impossible to reduce establishment charges in proportion to the turn-over, this means that engineering businesses are being carried on at a heavy loss at the present time. Notwithstanding the on at a heavy lors at the present time. Notwithstanding the present depressing conditions, however, everyone is stated to be confident that Canada will be the first country to recover at the close of the war, and as there is a very strong Imperialistic tendency resulting from the war, there should be a great increase in British trade. Our correspondent holds that there never was a time when the present for British resultance continues. a time when the prospect for British manufacturers capturing a large portion of the Canadian trade was brighter than it is at

a time when the prospect for British manufacturers capturing a large portion of the Canadian trade was brighter than it is at present, and it is hoped that our manufacturing friends at home will not fail to seize the opportunity.

We learn that the CANADIAN BRITISH ENGINEERING CO, LTD., of Winnipeg, of which Mr. Leonard Andrews is the managing director, has taken advantage of the slack time to move into new premises (85, Lombard Street). The company now has between 6,000 and 7,000 ft. of warehouse space all on the ground floor, with excellent offices on the second floor; also means of unloading machinery from a railway siding directly into the building. The company also has the use of a good yard space. One of the features of the new building is an engineering showroom with about 1,000 sq. ft. of floor space, of solid concrete and tiled floor. This enables the company to show machinery in motion, which was not possible in the old premises. This showroom has been fitted up as a permanent exhibition of British machinery in motion. Shortly before Christmas an opening week was held, demonstrations being given twice a day throughout the week. This exhibition was visited by about 200 visitors, including manufocurer, who happened to be in Winnipeg during the week, was also a visitor to the exhibitior. The keenest interest was shown in the company's demonstrations, and visitors were practically unanimous in their congratulations upon this method of in the company's demonstration, and visitors were practically unanimous in their congratulations upon this method of introducing British machinery. Inquiries are being received daily as the direct result of this exhibition, and when trade revives the as the direct result of this exhibition, and when trade revives the Canadian British Co. expects to do quite a big business in the sale of British-made appliances. It is Mr. Leonard Andrews's idea, as stated above, to run this showroom as a permanent exhibition of British-made appliances, changing the exhibit from time to timeso as to keep the interest in it alive. It may be that manufacturers at home who have specialities they want to introduce into the Canadian market will feel disposed to take advantage of this opportunity and send out appliances for exhibition. The cost of running such an exhibition is very heavy, and only those appliances can be shown which can be handled with advantage.

Bankruptcy Proceedings.—ALBERT WHITELEY, electrical and mechanical engineer, Tudno Works, Tudno Street, Llandudno, Carnarvon.—The first meeting of creditors was held at dudno, Carnarvon.—The first meeting of creditors was held at Chester last week, when the statement of affairs showed liabilities amounting to £476, and assets estimated to realise £163 net, the estate disclosing a deficiency of £312. The failure of the debtor was due to want of capital, loss of money in former partnership, and giving long credit. It was decided to leave the matter in the

and giving long credit. It was decided to leave the matter in the hands of the Official Receiver.

JAS. W. & TOM W. TATTERSALL (Tattersall & Tattersall), electrical engineers, Kimberley Road, Willesden Lane, N.W.—Receiving order made February 1st on debtors' own petition. First meeting February 12th; public examination March 16th; both at Carey Street, W.C.

MELDRUM BROS., LTD, Timperley, Manchester.—A third and final dividend of 1s. 81d. was payable on February 8th at 3, York -A third and Street, Manchester.

-Messrs. Edward Stanford, Ltd., of Long Acre, W.C., have issued, as usual, a coloured map (2s. sheet, 4s. in case), showing the proposed railways, tramways, and other schemes affecting Lundon, in the Parliamentary Bills deposited.

Water-Tube Boilers.—The Stirling Boiler Co., Ltd., state that, as far as water-tube boilers are concerned, business has become exceedingly lively since the beginning of the year. The following are among the more important repeat orders received by them:-

One boiler for the Newcastle and District Electric Lighting Co., Ltd. Two bailers for the Admiralty for Portsmouth Dockyard.
Four boilers for the Corporation of Huddersfield.
Five boilers for a large flow of ordnance makers in the North, fulfilling contracts for munitions of war.

Heavy Machines in Germany. - The syndicate of makers of manufactures in the heavy electrical branches, to which almost all the large groups and works belong, has been provisionally prolonged until the end of March. This will enable further time to be gained for negotiations for the renewal of the combination which would otherwise have come to an end at the close of 1914.

Deed of Assignment.-R. H. CLAMPETT, electrical engineer, Manchester.—Olaims must be sent in by February 20th, to the trustee, Mr. W. Kenyon, 41, Corporation Street, Manchester.

Catalogues and Calendars.—From Messes. Hart AND Co., of Bonnington Works, Newhaven Road, Edinburgh, we have received an art calendar for 1915. It consists of monthly cards each of which contains a charming reproduction from original water colours, showing various views of the building of

the Panama Canal.
MESSES E. BROOK, LTD., Colne Road, Huddersfield.—February

stock list of electric motors.

THE GENERAL ELECTRIC Co., LTD, 67, Queen Victoria Street, London, E C.—Lesflet X 1,850, giving illustrated particulars and prices of "Salford" circuit breakers. Also an illustrated and priced leaflet of the E.V.C. standard electric sign for indicating vehicle charging stations.

wehicle charging stations.

MESSES. ISAAC STOREY & SONS, LTD, Empress Foundry,
Cornbrook, Manchester.—40-page excellently illustrated and fully
descriptive catalogue of the Scott patent air compressors.
Dimensions, prices, and code-words are tabulated.

MESSES. LEY'S MALLEABLE CASTINGS Co., LTD., Derby.—
60-page illustrated catalogue of American and English
"Blackheart" malleable castings. The history of the Ley's company and particulars of the different departments are given.

Trade Announcements.—New premises at 31, Silver Street, Stockton-on-Tees, have been opened by Messes. R. Pickersgill & Son, Ltd., electrical engineers, &c.
Messes. Tredegar, of 53, Victoria Street, S.W., recently converted their business into a limited liability company, with the title of Tredegar's, Ltd., in order to give the staff a personal interest and to cope with increased business. Mr. H. A. Bartlett and Mr. G. F. A. Norman will be governing director and director respectively.

THE ANGLO ENGINEERING Co., LTD., has removed to larger premises at 6 and 7, Gough Square, Fleet Street, London, E.C.

premises at 6 and 7, Gough Square, Fleet Street, London, E.C. New telephone number: Holborn 5923.

The manufacturing branch of Houghtons, Ltd., hitherto carried on at the Ensign Works, Walthamstow, under the title of Houghtons, Ltd. (Spratt Bros.' Branch) has been amalgamated with the factory of W. Butcher & Sons, Ltd., and formed into a separate company known as the HOUGHTON-BUTCHER MANUFACTURING Co., Ltd., The management of the factories remains as hitherto. The new company has taken over all the contracts, assets and liabilities of the amalgamated factories.

Russian Trade.—The American Consul at Moscow Russian Trade.—The American Consul at Moscow reports that three societies have recently been founded with the economic development of Russia in view: For Russia, The Economic Revival of Russia, and the Russian Trade and Industry Union for the Development of Domestic and Foreign Trade; and the Moscow Merchants' Society has appointed a Special Committee for the same purpose. The Russian Trade and Industry Union will supply information to merchants with regard to foreign markets, will conduct sales and purchases on a commission basis, and will organise throughout the Empire trade and industrial museums and exhibits of samples.

Liquidations and Dissolutions.—The Miner's Lamp Liquidations and Dissolutions.—THE MINER'S LAMP ELECTRIC LIGHTING Co., LTD.—A meeting will be held at 42, Spring Gardens, Manchester, on March 10th, to hear an account of the winding up from the liquidator, Mr. James Blakey.

THE WESTMINSTER LIGHTING, HEATING AND VENTILATING Co., LTD.—A meeting of creditors is called for February 22nd, at 14. Old Jewry Chambers, E.C.

HABRY WITTUSEN & Co., glass merchants, 24, Thavies Inn, E.C. Messrs, E. Oakley and H. Wittusen have dissolved partnership.

-On Monday last Exhibition of Industrial Furnaces.-EXHIBITION OF ANGUSTIZE FUFFIXCES.—On Monday last Prof. J. O. Arnold, of Sheffield University Applied Science Department, opened an Exhibition of Industrial Gas-heated Furnaces, which will be on view until March 6th. The Exhibition consists of the products of the Brayshaw Furnaces and Tools, Ltd., of Manchester, and includes gas-heated furnaces for annealing, hardening, and tempering all classes of steel up to the hardest, and small tools. There is in connection with the furnaces an installation of electric pyrometers, supplied by the Cambridge Scientific Instrument Co., Ltd.

LIGHTING and POWER NOTES.

Antrim.—The C.C. has granted permission to Messrs. J. Den-more & Sons to erect an overhead cable for power supply from Greenfield to Oldgreen.

Ballymena.—Workhouse Lighting.—The B. of G. on the report of the electrical engineer has decided to install the electric light at the old infirmary.

Batley.—The plant ordered for the extension of the electricity works a year ago, which includes a 1,250-KW. Ljungstrom electricity works a year ago, which includes a 1,250-kw. Ljungstrom turbine set, has been requisitioned by the Admiralty for installation at one of the naval bases. This machinery, as also a similar turbine set for the Keneington and Notting Hill Co., and a rotary converter for the Kettering Council, was requisitioned at the Brush Co.'s works, where it has been constructed.

Beaumaris.—E.L. Scheme.—The Council has decided to request Mr. Price White to advise it on the proposed scheme for the electric lighting of the borough for municipal and general purposes.

Blackburn.—The borough electrical engineer is to proed with the work of laying cable to the new electricity substation at Mill Hill.

Boroughbridge.—E.L. SCHEME.—The question of introducing electric light into the town and Aldborough, at a cost of £1,200-£1,500, on lines indicated by Messrs. Best & Pullan, is to be discussed at a general parish meeting.

Bradford.—The Electricity Committee is fitting up a stand at the Belgian Village and Exhibition to be held in the Manningham Lane Rink.

In connection with the various Bills in Parliament during the 1915 Session, the Finance and General Purposes Committee has instructed the town clerk to seek, if possible, protection of the Corporation's interests which would be affected by the Keighley Electricity Order; to present a petition against the Yorkshire Electric Power Bill; and to obtain a protective clause in the Halifax Corporation Bill securing that omnibuses shall not be run along Reselford's transverse context. along Bradford's tramway routes.

Canada. - According to a Government engineer's report, no less than 400 000 H.P. can be developed within 80 miles of Winnipeg. It is thought that the production of electrical power on the Winnipeg River will lead to the founding of numerons additional towns along its banks.—Financier.

Canterbury. — RESTRICTED LIGHTING. — Owing to restricted lighting, there has been a saving of £157 in the street lighting account for the last quarter.

Cheriton.—The Folkestone Electricity Supply Co. has applied for the consent of the U.D.C. to a B. of T. order empowering it to supply current outside its prescribed area, and in the Council's district. The company has also informed the Council that it was possible it would enter into a contract with the War Office to supply current to the hut encampment on St Martin's Plain.

Dartford.—The U.D.C. has decided to supply free current to premises occupied by Belgian refugees, and to allow a rebate of two-thirds of the charge for current used at the club of the National Reserve Guard.

Darwen. - RESTRICTED LIGHTING. - Owing to the scarcity of coal the General Purposes Committee has decided to curtail the lighting of the street lamps, with the exception of the main thoroughfare.

-THREE-PHASE PLANT EXTENSION.—The Doncaster. alterations and additions at the electricity works have now been completed. The new plant comprises a 1,000-kw. William-Siemens turbo-alternator, one 600-kw. and one 350-kw. Westinghouse rotary and H T. switchgear. The installation will generate three-phase current at 3,300 volts, and sub-stations are erected, or are incorred of creation. course of erection, at Bentley, Hexthorpe and Balby for distribu-tion purposes. The work of installation was carried out by the Corporation's own staff. The extensions cost about £21,000, and constitute part of a larger scheme which has been drawn up by the Corporation electrical engineer (Mr. E. S. Rayner), and will be continued when necessary.

Dover .- PLANT EXTENSIONS .- Additional plant is to b3 provided at the Corporation electricity works, at an estimated outlay of £6,000. It is proposed to take out two sets of 75 and $178~\mathrm{KW}$, and replace them with a 1,000 KW. turbine set.

The B. of G. has under consideration a scheme for new laundry, cooking and heating plant at the workhouse, with provision for E.L. It is proposed to install a duplicate E.L. plant, with batteries of 100 cells, for 400 lamps, the estimated cost of this portion of the scheme being £1,900.

Dukinfield .- SEWAGE WORKS LIGHTING, &c.—The T.C. has decided to offer no objection to a proposal of the Ashton Corporation to light the sewage disposal works at Plantation Farm (which is in the Dukinfield area), and to drive a pump there by electricity obtained from the Ashton works.

Dundee.-The Dundee and Forfar Courthouse Committee has decided to install the electric light throughout the Courthouse.

Eastbourne.—New Plant.—The T.C. has referred back to the Committee the recommendation for the purchase of a 1,250-KW. "Ljungstrom" turbo-alternator and condensing plant, at a cost of £5,035.

Elland.—The Electricity Committee has decided to reduce the price of current supplied to cinematograph lanterns to 2½1. per unit.

Gillingham (Kent). - LOAN SANCTION. - The T.C. has received from the L.G.B., sanction to a loan of £6 800 for extensions to mains and services, and of this £6,000 is to be taken up at the present time.

Glossop.—The T.C. has decided, in order to protect its own interests, to oppose the Bill of the Stalybridge Joint Tramways and Electricity Board, which includes powers to purchase the local Urban Electric Supply Co.'s undertaking.

Hendon. - Workhouse Lighting. - The Hendon Electric Supply Co. has offered to enter into a contract for a period of five years for the supply of current for lighting and power to the workhouse at £2 10a per kw. per quarter, and ½d. per unit, if the Board will permit the company to run a low-pressure main from the transformer in the main road in order to supply consumers in the Burnt Oak area. The Sub-Committee of the B. of G. recommends the acceptance of the offer, as the annual charge would be £150, as compared with the estimated present cost of £259, and the scheme would reduce the excessive heat in the laundry, and result in considerable saving in cleansing and decora-tion, and possible reduction in coal consumption. The Guardians have adopted the recommendation, and tenders are to be invited for the work.

Henley.—The R.D.C. has decided to support the Reading Electric Supply Co.'s application for powers for an extension of the area of supply.

Holywell. — Workhouse LIGHTING. — The E.L. installation at the workhouse, carried out by Messrs. E. M. Evans and Co., of Manchester, under the supervision of Mr. A. J. Leigh, electrical engineer, at a cost of £727, has been completed.

-TATA SCHEME.—On Monday the Governor of Bombay switched on power from the Tata hydro-electric scheme. The technical features of the scheme were described and illustrated in our issue of January 16th, 1914.

Kintore.—Exhibition.—An exhibition and demonstration of electrical cooking and heating appliances has been given in the power station at Kintore by Messrs. T. C. Smith & Co., of Aberdeen.

Leeds.—Loan Sanctions.—At a meeting of the City Council, it was reported that the L.G.B. had sanctioned the birrowing of a further instalment of the £200,000 loan for the extension of the Whitehall Road electricity works. It was stated that in September, 1912, the Council threw out a scheme involving an expenditure of £595,000, the loan to be spread over 15 years, but since that date £265,821 in loans had been sanctioned for the department, and two further loan applications were before the Board which would bring the sanctioned expenditure up to £384,000. A resolution has been adopted that the Gas and Tramways and Electricity Committees be directed each to appoint four members to form a joint Sub-Committee whose duties shall be to consider and report to the full Committee from time to time on all questions relative to the scale of gas and electricity to consumers, with a view of preventing and avoiding overlapping and competition in the sale of those commodities. modities.

Littleborough.—Supply in Bulk.—An agreement has been formally entered into between the Rochdale Corporation and the U.D.C. in connection with the supply of electricity in bulk.

Liverpool.—Docks Electric Plant.—The Mersey Docks and Harbour Board has decided to provide an electrically-driven dust extracting plant in the bandalleys, &c, of the Waterloo grain warehouses, and to substitute electric light for the existing gas jets, at a total estimated cost of £3,200,

London.-HACKNEY.-The Electricity Committee has considered the electrical engineer's reports as to the desirability of linking up the electricity undertaking with that of the Poplar B.C. The result of linking up would be that the works belonging to Stepney, Shoreditch, Poplar and Hackney would be interconnected and able to supply each other in case of need; also it would be possible under the proposed conditions for one undertaking to supply the others from 12 o'clock midnight to 6 o'clock a.m., so that the necessity for running any works on a light and uneconomical load would be entirely avoided.

Several circumstances in the past have prevented the Hackney

and Poplar undertaking: from being interconnected. Hackney had no plant of a type that could be run in parallel with Poplar; the cost of interlinking the mains would have been very great;

and Poplar insisted upon heavy fixed charges being paid whether any units were taken or not.

The first difficulty has been overcome by the installation of plant suitable for running in parallel with Poplar, the laying of E.H.T. ring mains, which can be looped into Poplar from the junction of Wick and Sidney Roads, has removed the second difficulty, and the third difficulty has been overcome, as Poplar is now willing to give and take a supply with Hackney at a small charge

per unit, without any heavy annual fixed charges.

The Committee recommends that steps be taken to prepare a draft agreement containing the following conditions:—

1. Poplar to lay and maintain two 0'15 three-core, 11,000-volt standard paper-insulated copper-shielded and lead-covered cables, with pilot and telephone cable from the Northern Poplar substation to the Poplar-Hackney boundary in Cadogan Terrace.

2. Hackney to lay similar cables, forming a loop of the ring main from the pit at the junction of Wick Road and Cassland Road to the Road and Cassland Road to the Road and Cassland Road

main from the pit at the junction of wick Rosa and Cassiand Rosa to the Poplar-Hackney boundary in Cadogan Terrace.

3. The cost of the necessary switchgear to be provided for the purposes of the linking-up mains in the Poplar Northern substation to be borne εqually by Hackney and Poplar.

4. Either party to have the use of the other party's natural reserve plant without the payment of any fixed charges.

5. In the event of either party installing reserves plant for

5. In the event of either party installing reserve plant for stand-by or other purposes at the request of the other party, the first-named party to receive payment of such proportion of the

loan charges on the capital expenditure, and for such period as may be mutually agreed, or, failing agreement, the sum and period to be fixed by arbitration.

6. Either party to supply energy to the other party (subject to such limitation as is defined in Clause 4) at a price per unit measured at the supplier's switchboard, of 0.25d.

7. So far as practical, each party shall give to the other, equal supplies of energy, and only excess supplies shall be subject to be raid far in each paid for in cash.

8. The period of the agreement to be for 20 years, during which time the charges may be revised by mutual agreement at the end of each fifth year.

The cost of the necessary mains and switchgear for effecting the

link is estimated at £2,720.

BATTERSEA.—The Electricity Committee reports that owing to the increasing demand for the supply of electrical energy in the Nine Elms district, it will be necessary to extend its plant, and recommends the adoption of the scheme of the electrical engineer for two rotary converters of 500 kW. each, and one of 1,000 kW., together with the necessary switchgear and transformers, at an estimated cost of £8,750, and for duplicate E.H.T. feeders to be drawn into the existing ducts between the electricity generating station and a point in New Road, at an estimated cost of £7,000 kW. The Council is recommended by the Finance Committee to make The Council is recommended by the Finance Committee to make application to the L.C.C. for sanction to a loan of £15,750 to carry out the work. The Committee also recommends that negotiations be opened with the Fulham B.C. with a view to linking up the supplies of Battersea and Fulham under the London Electric Supply Act, 1908.

DEPTFORD.—In order to comply with the regulations of the L.C.C. as to the condition of the electrical installation at the borough hall, the Council is obtaining expert advice.

FULHAM.—The Electricity Committee reports that the demands for energy for consumers in the De Morgan and Townmead Roads area are increasing, and recommends that the Stephendale and Townmead Road sub-stations be connected up, and that the necessary cable high and low-tension switchgear, and two 100-kw. transformers be obtained at a cost of £570.

St. Panobas.—The chief electrical engineer reports a difficulty in obtaining supplies of coal; he has communicated with the railway company, the War Office, and the Railway Executive Committee, pointing out that unless the supply is improved the circumstances may be serious having regard to the fact that the factories in the borough, many of which are engaged in Government work, may have to shut down. The difficulty seems to have arisen owing to supplies not coming through from the collieries area ified in the contract. specified in the contract.

In reply to the B C.'s application for a loan of £22,530 for boilers

at King's Road generating station and £8,970 for mains, house services, meters and arc lamps, the L.C.C. states that the Parliamentary power to lend money to Metropolitan B.C.'s in the current financial year is nearly exhausted, and that the Council can only make an advance of £10,000 to the B C. at the present time.

The Finance Committee has accepted the loan of £10,000, and

will report later as to the steps taken to obtain the balance of the

L.C.C.—The Finance Committee recommends the sanction of the Council to the application of the Hammersmith B.C. to borrow £10,000 for purposes of the electricity undertaking, viz, £416 for buildings, £3,449 for mains, £1,535 for transformers, switch panels,

buildings, £3,449 for mains, £1,535 for transformers, switch panels, &c., £2,980 for house services and £1,620 for meters.

According to the Daily News and Leader, the L.C.C. has given notice of the withdrawal of its Electric Supply Bill, but a private Bill of a similar kind proposing to form a company for electric supply in London was put down for Thursday. This, it was stated, will be opposed by the County Council and by members on both sides of the House.

The **Xandond** of last Friday and Abat Aba 200

The Kandard, of last Friday, said that the Bill would not be withdrawn, but the application for first reading would be post-

poned, with a view to reconsideration of the vote.

RESTRICTED LIGHTING.—It is somewhat astonishing to find in these days of darkness that complaints have been made against the brilliantly lighted windows of the Houses of Parliament. Possibly the presence of so many "shining lights" within its portals, and a natural antipathy to hiding them, may account for the trouble.

Mottram-in-Longdendale.—The U.D.C. has decided to oppose the Bill of the Stalybridge, Hyde, Mossley and Dukinfield Tramways and Electricity Board, by which further electricity powers are sought.

Newcastle Power Schemes.—Reference has been made on many occasions in these columns to the development of elec-trical power distribution on the North-East Coast, more especially to the several power stations which have been built in the neigh-bourhood by the Newcastle-on-Tyne Electric Supply Co. and its associated companies. Some six and a half years ago, the Supply Co. decided that it would be expedient to construct a coal-fired power station at a point higher up the Tyne, and on the Gateshead side of the river, and it was decided to erect a plant on the banks of the Tyne at Dunston. This station, which has a river frontage of about 900 ft., was put into service some three and a half years ago, and formed the subject of a detailed illustrated article, which appeared in our issue of July 7th, 1911. The Dunston station generates three-phase current at 40 cycles and 6,000 volts. The steam pressure is 200 lb. per sq. in., and the steam is superheated, the total temperature being practically 570° F. The main generating units at present consist of two A.E.G. sets, each of 10,500 H.P., and

a Brown-Boveri set of 9,000 H P., all three running at 1,200 R.P.M. The station was originally laid out to accommodate eventually six generating units, each of 10,000 H.P. continuous capacity and 13,000 maximum capacity, or a total capacity of about 70,000 H.P. In connection with the present extension scheme, an agreement was entered into with the Teams By-Product Co., Ltd., to purchase the available supply of gas from a large battery of Otto-Hilgens ock coke ovens distant 1½ miles from the Dunston power station. This gas is led along the North-Eastern Railway Dunston branch in a 16-in. welded steel pipe, supplied by Messra. Stewarts & Lloyds, Ltd. The joints were welded in situ by the acetylene process. The boiler-house extensions comprise a steel **Aame building, sheeted in with corrugated iron, 114 ft. long × 75 ft. wide, with two steel chimneys. There are two coal-fired water-tube boilers, each steel chimneys. There are two coal-fired water-tube boilers, each capable of producing continuously 30,000 lb. of steam per hour, with the necessary furnace and fixtures, also stokers and superheaters. In addition, there are four gas-fired water-tube boilers, each capable of dealing continuously with 57,000 cb. ft. of gas per hour, built in two batteries, with the necessary flue fixtures inclusive of gas burner and superheaters. The fuel connomisers, one for each boiler, have automatic tube sorapers and dampers also coat also ning gear. Induced draught fame dampers, also soot - cleaning gear. Induced draught fans, direct driven by electric motors, deal with the products of comdirect driven by electric motors, deal with the products of combustion from two gas-fired boilers and one coal-fired boiler. There are two feed pumps, each capable of dealing with 200,000 lb of water per hour at 190 lb, to the square inch, boiler pressure. The coal-handling plant is of the gravity bucket conveyor type, and capable of feeding the coal into the overhead bunkers at the rate of 40 tons per hour. The plant is suitable for receiving coal from capable of feeding the coal into the overhead bunkers at the rate of 40 tons per hour. The plant is suitable for receiving coal from two hoppers of 25 tons capacity, each traversed by a railway truck. The overhead bunkers have a capacity of 950 tons. All the boiler-house plant and buildings were contracted for by Messrs. Baboock & Wilcox, Ltd., and the whole of these buildings were placed on a 6 ft. 6 in reinforced concrete raft supported on 376 40-ft. pitch pine piles, which work was executed by Messrs. Robert McAlpine & Sons, Ltd. The engine room plant extensions consist of a 12,000-kw. turboalternator with direct-coupled exciter, the turbine being of Messrs. Richardsons. Westgarth's manufacture, and the alternator by Richardsons, Westgarth's manufacture, and the alternator by Messrs. Brown, Boveri. The surface condensing plant consists of a Contrafic surface condenser capable of dealing with 141,600 lb. a Contrafic surface condenser capable of dealing with 141,600 lb. of steam per hour. The turbine is of the impulse-reaction type, designed to run at a speed of 1,200 R.P.M. with steam at a pressure of 190 lb. per sq. in., and at a temperature of 600° F, with a vacuum of '9-in. mercury. Though the normal and most economical load is 12,000 kW., the machine is capable of 50 per cent. overload. The alternator has a normal capacity of 12,000 kW. at a power factor of '7 lagging and 5,750 volts, 40 periods. It will, however, take overloads up to 13,200 kW. steady, and 15,000 kW. for 60 minutes, equivalent to 21,400 kVA. The necessary condensing plant has also been supplied by Messrs. Richardsary condensing plant has also been supplied by Messrs. Richardsons, Westgarth, and the whole of the installation has been built nd started up under the supervision of Messrs. Merz & McLellan, the consulting engineers to the Supply Co.

Nottingham. — PROPOSED LOAN. — The T.C. has adopted the recommendation of the Electricity Committee to borrow £20,000 for the extension of the electricity mains and LOAN. — The T.C. has

Nuneaton.—Current for lighting halls used for drill purposes is to be supplied by the T.O. free of charge. The Electricity Committee is still considering the question of giving a supply of current to the Stockingford district.

Oldham.—The T.C. has decided to oppose the Staly-bridge Joint Board's Bill, which seeks additional facilities and extension of area for electricity supply.

Ormskirk.--The U.D.C. has decided to oppose the Gas and Electricity Bill promoted by the Ormskirk Gas Co. A previous tesolution to the same effect was declared invalid.

Perth.—New Turbine Plant.—The Electricity Committee recommends the T.C. to apply for sanction to a loan of £4,000 for new plant, including a new turbo-generator, at the electricity works.

Portaferry (Co. Down).—An official inquiry was held last week into the Downpatrick R.D.C.'s application for powers for the electric lighting of the town.

Reading.—The T.C. has decided to oppose the Reading and District Electric Supply Cr.'s Bill to extend the area of supply in order to include Henley-on-Thames, as the Council considers that the extension would not prove sufficiently remunerative, and that the time at which the company's charges for lighting and power could be reduced will be postponed.

(Lancs.). — The U.D.C. has decided to supply electric light free to local training corps.

Sheffield.—The City Council has been recommended to adopt electricity for lighting the Fulwood Park Estate. It is proposed to put up a temporary installation for lighting Club Mill Lane, consisting of 20 wooden poles each fitted with a 60-watt (50-c.p.) metal filament-lamp and overhead cable. The Electric Supply Committee has decided to charge all hospitals for current consumed for lighting purposes at 4d. per unit less a rebate of 334 per cent. A similar rate is to be offered to the Guardians for all lighting at the Firvale workhouse buildings.

LIGHTING.—The Stretford.—Public U.D.C. has approved of the extension of the scheme for improved lighting of Chester Road. The lighting of the thoroughfare by half-watt lamps previously authorised is now completed.

As the lighting battery at Longford Hall will shortly require renewal, the electrical engineer, together with the surveyor, is to report upon the question of supplying current from the public

mains.

The Electricity Committee proposes to re-appoint Mr. Thomas L.-Miller as consulting engineer at a fee of 25 guineas.

Southport.—RESTRICTED LIGHTING.—The and gas engineers have been instructed to reduce the illumination of all lamps by darkening the tops and parts of the sides. The electrical engineer is to act on the instructions of the military authorities as to cutting off the supply if and when neces

Torquay.—The Electricity Committee reports that there was an increase of 189,959 A.C. units sold during the past year, while there was a decrease of 25,000 D.C. units.

Wakefield.—New Loans.—In connection with the electricity undertaking, application is to be made to the L G.B. for sanction to borrow £3,000 for mains, £500 for sub-stations, and £500 for transformers. Sugar Lane is to be lighted by electricity. The ventilation of the public library is to be improved by the provision of an electric motor and fan, at a cost of £65.

The Stanley Electric Lighting Provisional Order is to be opposed.

Wigan.—Proposed Loan.—Application is to be made

for sanction to the borrowing of money for switchgear and a transformer. Wimbledon.—The Electricity Committee reports that a

supply of electrical energy has been given to the factory of Messrs. Hugh Stevenson & Son, at 1d. per unit, with a minimum consumption of 20,000 units per annum, the supply to be taken for one year

Owing to the difficulty in obtaining delivery of coal at the generating station, consumers were warned that the Council might be compelled to restrict the output of electricity for all purposes at any time after 12 o'clock noon on February 3rd. On inquiry, on Tuesday last, we were informed that the difficulty had been removed.

Windermere.—Public Lighting.—The U.D.C. has invited the Electricity Supply Co. to quote terms for the public lighting of the district known as Craig Walk.

Worcester.—L.G.B. INQUIRY.—Mr. H. R. Hooper has held an inquiry into an application to borrow sums of £5,250, £1,975 and £850 for purposes of the electricity undertaking. He criticised the over expenditure on loans, and finally adjourned the inquiry with a view to obtaining amended financial returns.

Yorkshire Electric Power Bill.—A conference of local authorities affected by the provisions of the Yorkshire Electric Power Co.'s Parliamentary Bill, was held at Wakefield last week, under the chairmanship of the Hon. C. G. Milnes-Gaskell, when a resolution was adopted that, failing satisfactory amendaments to the Bill, it should be opposed by the Urban and Rural Councils of the West Riding, and that the Executive Committee of the District Councils' Association be requested to co-operate with the County Council for the purpose of making such opposition effective. In a discussion with the representatives of the Power Co. which followed, it was stated that 33 cut of the 84 Councils affected, approved of the proposals and supported the Bill. Mr. A. G. Lupton, chairman of the company, said that if any local authority wished to be cut out of the Bill, and such authority passed a resolution accordingly, they would be left out and cut off from all benefits that the company wished to bestow upon them. The Burley-in-Whafedale District Council, have taken advantage of this last statement, and have passed a resolution requesting Yorkshire Electric Power Bill .- A conference of tage of this last statement, and have passed a resolution requesting to be cut out of the Bill, failing which they will oppose it in accordance with the above-mentioned resolution. The New Mill District Council have also passed a resolution asking to be left out of the Bill altogether. We also note that the Skipton R.D.C. and Siladen U.D.C. are opposing.

TRAMWAY and RAILWAY NOTES.

Aberdeen.-P.A.Y.E. CARS.-The proposal to abolish the P.A.Y.E. cars on the Corporation tramways came before the T.C. last week, and after three hours discussion a decision was deferred pending further consideration by the Tramways Com-

Barnes. - ELECTRIC DUST VANS. - After trials of Baker and Edison dust vans, the Public Health Committee recommends that four such vans with Edison batteries be purchased, and that steps be taken to obtain a loan for the purpose.

B. of T. Tramways Statistics. - The annual return of the Board of Trade respecting the tramways, light railways and railless vehicle undertakings of the United Kingdom, for the period ending March 31st last, shows that 2,700 miles of route were open, and that 3,426,473,192 passengers were carried, 354,379,672 miles being run—these figures being in excess of those for the

year 1912-13. The percentage of working expenditure to gross receipts increased from 62.6 to 64.3, while the average receipts per passenger decreased from 1.065d. to 1.053d. The total capital expenditure amounted to £80,977.838. Some 4 per cent. of the route mileage is not worked by electric traction.

Of the 279 undertakings, 171 belong to local authorities and

108 to companies or other parties. The net receipts of municipal undertakings amounted to £4,071,610 for the year; £1,218,299 was required for interest or dividends, £120,039 for rent of leased lines, and £1,371,263 for reduction of debt; £589,886 was paid in relief of rates and £711,217 was carried to reserve and renewals. Three local authorities and five companies show an excess of working expenditure over gross receipts. In 26 cares it was necessary to seek aid from the rates to meet some part of the charges, including interest and debt charges.

Of 26 railless traction undertakings authorised, 21 belong to

Of 26 railless traction undertakings authorised, 21 belong to local authorities and 5 to companies. Altogether 131 miles have been authorised, and 21 miles were worked, all by local authorities. Municipal undertakings carried 2,696,759,064 passengers, worked 262,675,163 car-miles, and were credited with the use of 499,809,146 kw.-hours. The return shows that 406 horses were still in use, these, however, being mainly on the L.C.C. routes, which are now being electrified; Northampton and Morecambe being the only other places where horse traction still survived in municipal service.

The company undertakings carried 729,714,128 passengers, worked

The company undertakings carried 729,714,128 passengers, worked 91 704,509 car-miles, and were credited with the use of 130,052,873 KW.-hours. They also employed 550 horses in 11 undertakings, and 29 locomotives in 8 undertakings. On all lines, 13,196 electric

cars were in use and 462 non-electric cars,

As regards railless traction undertakings, Brighton and Hove As regards rainess traction undertakings, Brighton and Hove the largest authorised capital expenditure (£99,000 and £88,000), while Botherham (£48,000), and Chesterfield (£42,000), also figure prominently. Two company undertakings in North Yorkshire and Monmouthshire have an authorised capital of £130,000 between them. The returns for English railless traction undertakings working show that 1,807,222 passengers were carried, 369,691 miles were run, and 370,532 kw.-hours used. Working expenditure amounted to £10,935 and net receipts to £3,143. The only undertaking operating outside England was at Dundee, where 152,919 passengers were carried and 40,366 miles run, the receipts being £314 less than the working expenditure, £776.

Rolivia. -Tramway Scheme.—A scheme for the construction of an electric tramway from La Paz to the Yungas Districts has been reported on favourably, and will in all probability be approved by the House of Legislature in due course. The territory through which the proposed line is to pass is probably the richest agricultural part of the Department of La Paz under actual cultivation. The roads leading thither from La Paz are good, and from a short distance from the city to the farthest distances travelled enormous water power is to be found to supply not only the proposed line, but any number of industries. It is almost certain that an electric tramway once constructed would cost very little to operate. The maximum cost of the line is calculated as £500,000, and the work would be directed by the Public Works Department of the Bolivian Government, its cost being defrayed from the Treasury of the Department of La Psz. Surveys have been made by the Bolivia Railway Co. and by the Public Works Office. The United States Minister states that there might be an opportunity for a manufacturer, who was sufficiently interested, to arrange with the Government to construct the tramway on his own account.

Bradford.—The Corporation Tramways Committee has decided to remove the exisiting car-shed at Bolton before the end of the present year, and has instructed the city architect, in conference with the general manager, to proceed with the preparation of plans for the erection of a new car depôt. A special Sub-Committee has been appointed to inquire into the whole question of tramway track construction and maintenance.

Bury.—The extensions of the Corporation tramways to the borough boundary at Jericho, and to the New Inn at Walmersley, have now been completed, and are awaiting inspection by an officer of the B. of T.

Clayton-le-Moors.—The Council has decided to object to the granting of an extension of time for the construction of the Clayton Light Railway.

Doncaster.—TRAMWAY EXTENSIONS.—The extension of the tramways system from Balby to Warmsworth was inspected on the 4th inst. on behalf of the B. of T.

Four additional cars have been ordered, and borrowing powers are being sought by the T.C. for six others.

London.-I.C.C.-The total traffic receipts on the Council's tramways from April 1-t, 1914, to January 27th, 1915, were £1,906,270 from lines worked by electric traction, and £9,164 from horse traction, a total of £1,915,434. The receipts for the corresponding period of the previous year under the same headings were £1,803,109, £18,635, and £1,821,744 respectively.

Merthyr Tydfil.—Assessment Troubles.—The Merthyr Electric Traction Co. has appealed against the assessment of ite undertaking, fixed at £2,571 in the borough and £86 in Cefn. In 1905 the rateable value was fixed at 6 per cent. on the gross receipts, with an agreed sliding scale basis, and in 1913, it was contended, the rateable value had risen to 11 per cent. The company considers that £1,600 should be the proper rating for Merthyr, and that on a give-and-take principle it should not exceed £1,780. The Assessment Committee has decided to ascertain from the valuers the basis on which they arrived at their assessment.

London.—The Metropolitan Railway, which has been reconstructing its country extension with four tracks, is to provide a new fast service of trains on those lines from May 1st.

Nelson.—The tramways continue to suffer as a result of the war. It was reported that for the period commencing December 12th, and ending January 9th, 216,236 passengers had been carried, against 279,437 for the corresponding period a year ago, the receipts being down to the extent of £206.

South Africa. - ELECTRIFICATION OF RAILWAYS. - At a meeting of the South African I.E.E., Mr. F. W. Mills, electrical superintendent S.A. Railways, stated that electrification of the suburban lines at Cape Town had been considered and reported upon, and that he had no doubt that in the near future the electrical superintendent in t trification of certain sections of the line would become one of the live questions. as both Mr. Hoy and the Railway Board were keenly interested. He considered that under certain conditions it would pay to electrify the railways, and with the assistance of the Victoria Falls Co. he considered that electrification was at hand if only a low price for power could be obtained.

South Shields.—A TRAMWAY PROPOSAL.—The T.C. last week agreed to the Tramways Committee's proposal to confer with the Jarrow Corporation, and to enter into negotiations with the Jarrow Tramways Co. with the view to taking over the company's undertaking.

Walsall.—The Finance Committee of the T.C. has decided to transfer from the tramways account a further sum of £1,000 towards the relief of the rates during the year ending March 31st next.

The Daimler Co. having offered six motor-omnibuses at the price of £5,369 complete, the Tramways Committee has purchased the same, and recommends the Council to enter into a new contract therefor, the old contract for six vehicles to remain in force, and be fulfilled as soon as circumstances enable the company to deliver the vehicles.

Wigan.—The Tramways Committee has decided to carry out alterations to the tramways track in Standishgate and Crompton Street, at an estimated cost of £1,126.

TELEGRAPH and TELEPHONE NOTES.

A Real Wireless Antenna. - According to a letter published in the Scotsman, from a Scot resident in Buenos Ayres, there were "Clandestine wireless installations all over the city, which could reach a strong station on a German 'estancia' down south, which, in its turn, used to communicate steamer sailings, &c., to the German commerce destroyers. . . . When the Argentine Government got after the clandestine installations the German Electric Co. used the smoke of their big chimney instead of antennæ, as the smoke contains enough carbon to act as conductor for the Hertzian waves. What do you say to that?"

This seems to go one better than Mr. Campbell Swinton's bed-stead receiver.

stead receiver.

Automatic Telephones.—It is proposed to provide all the telephone exchanges in the Sheffield area with full automatic equipment, and to replace the present Liverpool Central Exchange by a semi-automatic exchange in the "Bank" building.

-The United States Consul at Hankow states China.—The United States Consul at Hankow states that last July a new C.B. installation, with American equipment, was opened at Changsha. It has a present capacity of 1,000 local lines and 40 toll or long-distance lines, and is arranged for an ultimate capacity of 3,000 lines. It replaces one of the magneto type, equipped for 350 lines. The Chinese have now thoroughly realised the advantages of the telephone for commercial as well as Government uses, and are beginning to recognise that telephone systems, properly designed and managed, will yield profits, so that it will be easier to interest local capital in such schemes.

Illicit Wireless Installations.—At Enfield Police Court on Monday Stanley Warren White, a wireless student, was charged on remand with having in his possession, without the written permission of the Postmaster-General, a complete wireless installation. Experts stated that the apparatus was capable of sending and receiving messages from eight to ten miles. The defence was that the apparatus was really a toy. The magistrate

imposed a fine of £7 and costs, and the wireless apparatus was ordered to be detained by the Post Office authorities until after the war.

Mr. Hamilton Bell, a draper, was fined £20 by the Castle Eden magistrates on Saturday for being in unlawful possession of a wireless apparatus at Blackhalls, on the Durham Coast.

Long-Distance Telephony. - The trans-Continental telephone service between New York and San Francisco will be opened for commercial use early next month. The rates will be \$20.70 for three minutes and \$6.75 for each additional minute. These high rates are justified by the fact that communication between these cities involves the employment of \$2,000,000 worth of plant.

New Cable. — The new submarine cable between Nagasaki and Shanghai, the laying of which has been in progress for the last two years, has now been completed and opened for the transmission of messages between Japan and China.

CONTRACTS OPEN and CLOSED.

Aberdare.—March 6th. U.D.C. Twelve months' supply of cables, meters, joint-boxes, &c., lamps, uniforms, tickets and other stores. See "Official Notices" February 5th.

February 19th. Wiring and fittings at the Police Court, for the Glamorgan Quarter Sessions Standing Joint Committee and C.C.

Specification from the Architect, County Hall, Cardiff.

Australia.—Brisbane.—March 10th. Motor-generator, power board, &c., for Postmaster-General. See "Official Notices"

January 15th.

April 7th. Deputy P.M.G. Wheatstone receivers and transmitters (Schedule 335). High Commissioner for Commonwealth, 72 Viotoria Street, S.W.

MELBOURNE.—March 16th. White Wheatstone receiving tape, for Postmaster-General. See "Official Notices" February 5th.

Bedwas.-March 4th. Electrical goods for 12 months, for the Bedwas Navigation Colliery Co., Ltd. Forms of tender from the Secretary.

Blackburn. — February 13th. Corporation. Twelve months' supply of stores, including a number of electrical items, for the Electricity Committee. See "Official Notices" Jan. 29th.

Bootle.—February 17th. Corporation. Twelve months' supply of cables, meters and electrical stores. Forms of tender from the Borough Electrical Engineer.

Bridlington.—The T.C. has instructed the Borough Biectrical Engineer to obtain provisional tenders from six firms for the erection and equipment of a refuse destructor.

Cardiff.—February 22nd. Installation, 750 points, at w Technical Institute, Cathays Park, for the City Council. New Technical Institute, Cathays See "Official Notices" January 22nd.

Dublin.—February 18th. Corporation. Twelve months' supply of arc lamp carbons. See "Official Notices" to-day.

Edinburgh.—The City Council has decided to postpone advertising for contracts for stores for two months, and, in the event of the present conditions continuing into April, to make the contracts then advertised extend, if necessary, over short periods only, instead of 12 months.

Twelve months' supply of Gloucester. — April 1st. stores, for the Electricity and Light Railways Committee. Forms of tender from Mr. F. H. Corson, General Manager, Light Railways Offices, Bristol Road.

Halifax.—February 15th. Corporation. Twelve months' supply of stores, including lighting fittings and electrical accessories, cables, telephone wire, meters, &c. See "Official Notices" January 22nd.

Ilford. — February 23rd. U.D.C. Twelve months' supply of stores for the electricity works. See "Official Notices February 5th.

Leeds.—February 20th. Corporation. Twelve months' supply of stores, including cable, mains boxes and fittings, jointing and insulating material, electric lamps, fittings, &c., for Electric Lighting Department. See "Official Notices" January 22nd.

February 17th. Electrical work, Hough Lane Shool, Bramley, for the Elucation Committee. Education Architect.

February 22nd. Corporation. Twelve months' supply of electrical sundries, for the Tramway Department. Forms of tender from the Tramway Manager.

London.—ISLINGTON.—February 24th. B.C. Twelve onths' supply of electrical stores. See "Official Notices" months' supply of electrical stores. February 5th.

February 5th.

St. Panchas.—February 15th. B.C. Arc lawp carbons, for the Electricity Department. See "Official Notices" January 29th.

St. Manylebone.—February 17th. Stores, including meterboards, casings, &c., cables, box compound and insulating materials, &c., for Electricity Department. See "Official Notices" Jan. 29th.

Wimbledon.—February 22nd. Corporation. Twelve months' supply of stores for the Electricity Department. See "Official Notices" to-day.

Fulham.—February 24th. B.C. Twelve months' supply of electrical stores. See "Official Notices" to-day.

Hammersmith.—February 24th. B.C. Twelve months' supply of general electricity stores. See "Official Notices" to-day.

Battersea.—March 2nd. B.C. Supply of stores for Electricity Department. See "Official Notices" to-day.

Macclesfield.—March 10th. Cheshire County Asylum.

Macclesfield. - March 10th. Cheshire County Asylum, Parkside. Electrical goods for one year. Forms of tender and particulars from Mr. Wm. Tingay, Clerk of Asylum. Manchester. — February 16th. Corporation. Twelve months' supply of stores for the Tramway Department. See "Official Notices" January 29th.

New Zealand.—May 3rd. Electrically-driven turbine pumps of 80,000 and 100,000 gallons capacity per hour, together with direct-coupled motors. Commercial Intelligence Department, Board of Trade, London.

North Bierley.—February 22nd. 800 electric incandessent lamps, for the Guardians. See "Official Notices" to-day.

Portsmouth. — February 16th. Corporation. months' supply of stores, for the Tramway Committee. "Official Notices" February 5th.

Reigate.—February 20th. Corporation. Supply of coal for the electricity works. Particulars from Mr. W. S. R. 188, Electrical Engineer.

Rotherham. — February 22nd. Corporation. Two water-tube boilers, automatic mechanical stokers, economisers, superheaters, foundations, steel chimneys, steam valves, steam pipes, induced-draught plants, and all auxiliaries. See "Official Notices" January 29th.

Salford.—February 22nd. Twelve months' stores for the Tramways Department. General Manager, 32, Blackfriars Street.

Spain.—The municipal authorities of Cogeces del Monte (Province of Valladolid) have just invited tenders for the concession for the electric lighting of the town.

Stockton-on-Tees.—February 19th. Corporation. Two 500-kw. rotary converters, transformers and starting apparatus. See "Official Notices" February 5th.

Swindon. — February 17th. Corporation. Four-way and other stoneware conduits, for the Electricity and Tramway Department. See "Official Notices" February 5th.

CLOSED.

Argentina. - The American Consul at Rosario says that Argentina.—Ine American Consul at Rosario says that the Government has accepted the tender of the Gasmotoren Fabrik Deutz for the installation of motors for electric plants in 11 barracks in the cities of Tucuman, Salta, Jujuy, Corrientes, San Nicolas, Santiago del Estero, Catamarca, Mendoza and Mercedes, Six tenders were received, ranging from \$33,118 to \$89,166. The Gasmotoren Fabrik Deutz offers to deliver the motors for \$33,118, to which amount \$2,123 is added for necessary masonry work.

Batley.—The E.L. Committee has accepted the tender of Messrs. Ferranti, Ltd., for 17 meters.

Bradford.—The Corporation Tramways Committee has accepted the tender of Messra W. A. Stavens, Ltd., for a 40 HP. Tilling-Stevens petrol-electric chassis required for a tower wagon,

Ecuador.—The Guayaquil Electric Light & Power Co., Guayaquil, Ecuador, has placed the following contracts:-

Two 400-B.H.P. Diesel engines.—Hick-Diesel Oil Engines, Ltd.
One 275-kw. alternator and one combined traction and alternator set.—
Crompton & Co., Ltd.

Clyde Navigation.—Messrs. Johnson & Phillips, Ltd., have secured an order from the Clyde Navigation for an installation of power cables for Queen's Dock.

Dartford. - The following tenders for coal for the electricity works have been accepted by the U.D.C.:-

John Herd. Son & Co., Ltd.—Yorkshire rough small, 22s. 6d. per ton South Hetton rough small, 5s. p. r. ton above contract price.

Bradbury, Son & Co., Ltd.—Tamworth 1½ in. slack, 16s. 7d.; Gedling 1½ in. slack, 17s. 6d.

Cleeves & Co.—Mid-Cannock 2-in. slack, 17s. 6d.; Kirkby 2-in. slack, 18s. 4d.; Bad-desley fine slack, 18s. id.

E. J. & W. Goldsmith, Ltd.—Rubbly Culm, 2s. per ton above contract price.

Myers, Rose & Co., Ltd.—Ripley nutty slack, 1½ in. to 1½ in., 20s.; Gedling coal, 18s.; Mansheld coal, 18s. 9d.

Dorchester.-The County of Dorset Supply Co. has placed a meter contract for the period of 1915-16 with the Electrical Apparatus Co., Ltd.

Dover.—The T.C. has accepted the tender of Messrs. Dick. Kerr & Co., Ltd., for 50 tons of tramway rails (45 ft.), at £8 153, per ton. Two other tenders, each for 30-ft. rails, were £7 15s. 4d. and £8 8s. per ton respectively.

Keighley.-The tender of Messrs. Drakes, Ltd., Halifax, for new carbonising plant at the gasworks, including electrical power generating plant, has been accepted by the T.C.

London.-Messrs. Napier-Kimber, Ltd., have obtained a contract from the Metropolitan Asylums Board for installing an electrically-driven mineing machine and potato-paring machine at Western Hospital, Fulham.

The London Education Committee has received the following tenders for installing electric light at the Exmouth Street School, St. Panoras :-

G. Weston & Sons, Ltd.
T. H. Smerdon . . .
Lund Bros. & Co. . .
Honor Bros.

FULHAM.—The Electricity Committee reports that Messre. A. Duckham & C)., Ltd., and Messrs. Wilcox & Co., Ltd., the contractors for lubricating oils, are prepared to renew their contracts on the existing terms for the ensuing year, and recommends that further contracts be entered into with Messrs. A. Duckham & Co., Ltd., for 12 months to March 31st, 1916, for the supply of cylinder oil at 1s. 8d. per gallon, and with Messrs. W. H. Wilcox & Co., Ltd., for the supply of engine oil at 1s. 4d. per gallon, and turbine oil at

1s. 6d. per gallon.

Stepher.—With reference to the Council's orders for carbons, the British Central Electrical Co., Ltd., writes to state that the French Government's prohibition of exports of carbons only prevailed for a few days, and is now removed.

Middleton.—The E.C. has accepted a tender of Mr. G. Hulbert to supply 1,800 tons of coal during the six months commencing March 1st.

Romford.—The B. of G. has accepted the tender of the Private Telephone and Electric Co., Ltd., for the installation of a house telephone service, at £59.

Salford.—The following plant has been obtained for the electricity station, Frederick Road :-

Turbine-driven boiler and feed pump.—G. & J. Weir, Ltd., £285, Boiler f.ed water heater.—Isaac Storey & Sons, £78.

Sheffield.—The following tenders have been recommended to the City Council for acceptance :-

ELECTRIC SUPPLY DEPARTMENT. C. A. Parsons & Co.—One turbo-alternator, consisting of steam turbine, condensing plant, alternator and accessories, £31,413.

Abbott & Bannister.—Erection of sub-station, Carr Road, Wa'kley, £215.

British Electric Transformer Co.—Three 159-x.v.a. t.ansformers, £225.

WATER DEPARTMENT. General Electric Co.—One 40-H.P., one 20-H.P., one 6-H.P., and one 1-H.P. electric motors.

TRAMWAYS DEPARTMENT. Durham, Churchill & Co.—45-R.P. chassis for 'bus, £650. Hadfield's Steel Foundry Co.—17\(\frac{1}{2}\) tons of tie-bars.

Ship Lighting.—A contract for Osram lamps has been placed with the General Electric Co., Ltd., by the Bibby Line of steamers, supplanting carbon lamps and other makes of metal-

of lamps. This contract covers an exceedingly large quantity of lamps, and was placed after exhaustive tests.

The lamp contract mentioned under the above heading last week is for the Orient Steam Navigation Co., and not the British India Steam Navigation Co., as mentioned.

Southport.—The tender of the Improved Wood Pavement Co., Ltd., for the repairing of tramway track in Lord Street, at a cost of 13s. per sq. yd., has been accepted.

Torquay. - The T.C. on February 2nd accepted the following tenders :-

Rees Roturbo Co.—Motor-driven sea water pump for generating station, £248.

Herbert Morris, Ltd.—Overhead travelling crane, £185.

T. L. Harding & Sons.—Steelwork for coal transpore, £36.

British Thomson-Houston Co., Ltd.—Switchgear, £1,564.

Tunbridge Wells. - The T.C. has, subject to the L.G.B. sanctioning loans, accepted the following tenders:-

Stirling Boiler Co.—Boiler and auxiliary plant, £5,630.
Witting & Partners.—Cooling tower, £1,800, and dismantling the existing tower and rebuilding a new one, £953.

Walsall.—The Tramways Committee has accepted the offer of the Daimler Co., Ltd., to supply six motor-omnibuses in addition to those already contracted for—and which will be delivered as soon as the requirements of the War Office are complied with—at a cost of £5.369.

Warrington.—The Electricity and Tramways Committee has accepted the tender of the Lion Foundry Co. for the supply and erection of tramway shelters.

Watford.—The tender of Messrs. Jackson & Co. has been accepted by the U.D.C., at £220, for repairs to a turbine.

Wigan.—At the T.C. meeting on February 3rd, Alderman Higham stated that the E L. Committee had rescinded a resolution accepting the tender of a firm for switchgear and a transformer, the discovery having been made that the firm was a German concern. He was pleased to say that an English firm had undertaken to do the work for the same price.

Wolverhampton. — The Electricity Committee has accepted the tender of the Rees Roturbo Co., Ltd., at £165, for two electrically driven pumps.

FORTHCOMING EVENTS.

Physical Society of London.—Friday, February 12th. At 8 p.m. At Imperial College of Moience, South Kensington, S.W. Papers on "The Criterion of Steel Suitable for Permanent Magnets," by Prof. S. P. Thompson, F.R.S.; "A Galvanic Cell which Reverses its Polarity when Illuminated," by Mr. A. A. C. Swinton; "An Investigation on the Photographic Effect on Recoil Atoms," by Mesars. A. B. Wood and A. I. Stevens.

Salford Technical and Engineering Association,—Saturday, February
13th. At 7 p.m. At Royal Technical Institute Peel Park, Paper
on "How Plants Protect Themselves," by Mr. J. E. McDonald. Ledies invited.

Greenock Electrical Society.—Saturday, February 18th. Visit to Royal Technical College, Glasgow.

Thursday, February 18th. At 7.45 p.m. At 21, West Stewart Street.
Paper on "Diesel Engine Testing and Running," by Mr. J. Richardson.

North of England Institute of Mining and Mechanical Engineers.—

Sturday, February 13th At 2 p.m. At Memorial Hall, Newcastic-onTyne. Various papers will be open for discussion. To be read, paper on
"Winding-Engine Signals," by Mr. W. H. Davis. Demonstration with a
Sterling Mine-signalling apparatus.

Royal Society of Arts.—Monday, February 18tb. At 8 p.m. At John Street, Adelphi. Fothergill Lecture on "Motor Fuel," by Prof. V. B. Lewes.

Institution of Electrical Engineers (Newcastle Local Section).—
Monday, February 15th. At 7.80 pm. At Mining Institute. Discussion

Institution of Post Office Electrical Engineers.—Monday, February 15th. At 6 p.m. At Institution of Electrical Engineers Victoria Embantment, W.C. Paper on "Wireless Call Devices," by Mr. L. B. Turner, Demonstration following.

Illuminating Engineering Society.—Tuesday, February 16th. At 8 p.m. At House of Royal Society of Arts, John Street, Adelphi. Discussion on "The Development and Design of Lighting Fixtures in Relation to Architecture and Interior Decorations," opened by Mr. F. W.

Institute of Marine Engineers.—Tuesday, February 16th. At 8 p.m. At Tower Hill, Munories, E. Discussion on "Fuel Test."

Nottingham Society of Engineers.—Wednesday, February 17th. At 7.30 p.m. As Welbeck Hotel, Muson Street. Paper on "The Apprentice Question," by Prof. O. H. Buileid.

Institution of Mechanical Engineers.—Friday, February 19th. At 8 p m. At Storey's Gate, S.W. Annual General Meeting. Paper on "Convertible Combustion Engines," by Mr. A. E. L. Choriton.

Combustion Engines," by Mr. A. E. L. Choriton.

Royal Institution of Great Britain.—Friday, February 19th. At 9 p.m. At Abemaric street, W. Paper on "The Visit of the British Association to Australia." by Prof. H. E. Armstrong, F.R.S.

Baturday, February 20th. At 8 p.m. Lecture on "Recent Researches on Atoms and Ions," by Prof. Sir J. J. Taomson, F.R.S.

Association of Mining Electrical Engineers.—Saturday, February 20th. At 4.30 p.m. At Royal Technical College, Glasgow. Paper on "Some Experiences in the Handling of Electricity," by Mr. A. Smellie.

NOTES.

The War and Foreign Trade.—THE JANUARY FIGURES.—The following are the electrical and machinery figures given in the official returns for January :-

IMPORTS.

Electrical goods and apparatus, excluding machinery and un-	Month of January,		Inc. or dec.
insulated wire	£56 ,865	_	£81,646
Machinery	£618,404	+	£19,013
EXPORTS.			

lectrical goods and apparatus, excluding machinery and un-insulated wire

£269,893 + £10,1... - £1,724,253 £16,172 Machinery £1,663,482

Electric Cars and Accessories at the New York Show. The wider use of the battery for ignition, the practically universal adoption of electric starting and lighting, improvements in electric gear-shifting mechanisms and the introduction of electric transmission systems were features of electrical interest at the fifteenth annual national automobile show held in New York, January 2ad to 9th.

January 2:10 to som.

The development of electrical accessories for 1914, as evidenced by various devices shown, has been directed chiefly towards greater simplicity, and, wherever possible, a reduction in weight. This has been particularly the case with magnetos. Among the starting apparatus there were a variable-speed compound-wound machine of improved type and several new devices for starting Ford cars.

With lighting systems the lamps have been made simpler in With lighting systems the lamps have been made simpler in appearance. Many devices were also shown for dimming the brilliance of headlamps.—Electrical World.

Melbourne City Council and British Preference.-At a December sitting of the Melbourne City Council, consideration was given to a letter from the British Trade Commissioner, Mr. G. T. Milne, suggesting that the Council in all its purchases should give preference to goods manufactured either in the Commonwealth or in the United Kingdom, and to recommendations of the Electric Supply Committee, as follows:—

I a purchasing or obtaining any goods, machinery, or material, "In purchasing or obtaining any goods, machinery, or material, the Council will give effective and substantial preference to goods, machinery or material manufactured or produced in the Common-wealth. If goods, machinery or material manufactured or produced in the Commonwealth cannot be purchased, or can only be purchased in insufficient quantities, or of a quality unsuitable for the work, the Council will give substantial and effective preference to goods, machinery or material produced and manufactured in the United Kingdom, as against those of foreign manufacture."—Australian Mining Standard manufacture."-Australian Mining Standard.

Inquiries. - Makers of the "Franco," "Standard," and other fissh-lamp refills are asked for; we understand that our correspondent has orders to place for large quantities. Makers of a substitute for Galalith are inquired for.

Iron Leads for Installation Work.—The Prussian Minister of Commerce and the Minister for the Interior have issued a joint memorandum pointing out that under existing conditions difficulties should scarcely any longer be met with in securing connections with central stations owing to the lack of installation materials, seeing that the Union of Electrical Engineers, in agreement with the makers of installation materials, has extended its standards to the possibility of the employment of iron conductors with impregnated paper insulation and a watertight metallic outer envelope. It is further suggested that easy terms of payment should be introduced for facilitating the carrying out of installation work, and that lower charges for supply should be granted in connection with small installations for a certain be granted in connection with small installations for a certain period.

Low-Tension Auxiliary Supply in High-Tension D.C. Traction Systems.—One of the minor problems associated with high-tension direct-current traction systems is that of obtaining current at low pressure for train lighting and the supply of heaters, fans and other auxiliaries, by means of a pressure-reducing apparatus at once light, compact and reliable. On the Biasca-Acquarossa 1,200-volt electric railway, on the 1,500-1,800-volt Wendelstein system, and on the Tavannes-Noirmont line in Swiss Jura there have been used, during the last few years, pressure-reducing motor-generators supplied by Brown, Boveri & Co. Each set comprises a direct-coupled interpole motor and dynamo, with differential compound winding on the motor for voltage regulation. The special feature, by which high-tension current is confined to the motor armature, is excitation of the high-tension machine by low-tension current derived from the lighting dynamo. The motor interpoles are connected to the earthed side of the motor-armature. Shunt characteristics are secured in the motor, but only its armawith high-tension direct-current traction systems is that of obtain-

interpoles are connected to the earthed side of the motor-armature. Shunt characteristics are secured in the motor, but only its armature need be insulated for high pressure; the insulation there used is a special mice composition tested to 9,000 volts A.C.

These sets have proved so satisfactory in service that they are now adopted as standard by the makers for all D.C. traction systems operating at 1,200 volts or higher pressures. To save space and weight, both motor and generator armatures are mounted on the same shaft within a cast-steel housing serving as magnetic yoke for both field systems. The pole cores are bolted on. Besides supplying the lighting circuits, the dynamo also supplies current for heating purposes and for faue, air pumps, and any other auxiliary services on the train. Six standard sets range from 2 to 40 kw. output, and are wound for 1,500 to 2,500 volts primary and 30 to 330 volts secondary pressure. The 40 kw., 1,000 R.P.M. set, wound for 2,000-2,200 volts primary pressure, weighs 3,410 lb. net, and is used in all coaches on the Chur-Arosa and Nyon-Morez lines. To eliminate reproduction in the secondary circuit (proportionately reduced) of variations in the line pressure, a Brown-Boveri autoreduced) of variations in the line pressure, a Brown-Boveri automatic voltage regulator may be used to operate on the dynamo excitation; differential compounding of the motor is provided on all new locomotives of the Oberland-Bernois lines, the revolutions excitation; differential compounding of the motor is provided on all new locomotives of the Oberland-Bernois lines, the revolutions per minute of the reducing set (which is direct coupled to a ventilating fau), being constant between primary pressure limits 1,300-1,700 volts. Sudden closing of the line circuit does not produce excessive sparking on the H.T. motor commutator, and special attention has been directed to securing sparkless commutation during normal operation. A 40-kw. four-pole single commutator motor designed for 2,200 volts commutates sparklessly on 3,500 volts under 20 per cent. current overload.—La Lumière Electrique.

Turbo-Electric Steamer.reported in this journal, the large Swedish steamship company, the A/S Sveabolaget, has lately been making an experiment by building a new turbo-electric steamer, which seems to be of considerable importance. The company has had under construction at the Lindholmen Shipbuilding Yard at Stockholm two steamers, which have been built according to the same drawings, and resemble each other as closely as possible. This has been done with the view of making a fair comparison between them possible. Both steamers have now been completed, and have a displacement of 2 225 tons; they have been designed for a normal possible. Both steamers have now been completed, and have a displacement of 2,225 tons; they have been designed for a normal speed of 11 knots. The first one, the *Mimer*, was finished in Outober, and was equipped with an ordinary triple-expansion engine, while the second, the *Mjölner*, was completed just before Christmas, when it underwent its first trial with its turbo-electric plant, which was designed by the Swedish engineer Ljungströn. The turbine plant occupies much less space than ordinary triple-expansion engines, and is not so expensive as a Diesel engine. The consumption of coal was estimated to be less than for ordinary expansion engines, and is not so expensive as a Diesei engine. The consumption of coal was estimated to be less than for ordinary steamers, and, in fact, there was guaranteed a saving of 30 per cent. of coal. On the trial trip the $Mj\ddot{v}lner$ was fitted with the screws of the Mimer, and the trial, which lasted seven hours, gave excellent results. The machinery, in which gearing is employed, developed 975 I.H.P., or 75 H.P. more than it had been designed for, and an average speed of 11 8 knots was obtained. The consumption of coal turned out to be 35 per cent. below that of the sister-ship, and during the three hours, when the consumption was measured, the quantity of coal required per I.H.P.-hour amounted to 0 88 lb. Representatives of the shipping and technical world who accompanied the ship on its trial trip, among whom were also representatives of the Swedish Navy, expressed their satisfaction with the results obtained, and there was, in fact, unanimous agreement that the turbo-electric steamers would be the ships of the future.

Fatalities.—A Cape Town correspondent reports that an ratalities.—A Cape Town correspondent reports that an accident occurred at Sea Point, on January 11th, whereby a young man named Arthur Grover, an electrical jointer in the employ of the Cape Town Corporation, lost his life. It appears that Grover was occupied in cleating up some high-tension live wires in a new transformer station when he noticed some "arcing" in progress between one wire and the wall of the transformer station. Instead of switching off the high-tension side, which would have necessitated his walking to the next transformer station he simply told tated his walking to the next transformer station, he simply told his assistant (a coloured man) to take the wire out of his way. The assistant did so by placing the wire on the fiver with a bare end exposed, and shortly afterwards Grover accidentally touched the bare end; as he was then standing in an open trench, he received practically a full 2,000-volt shock to earth. A local dector was immediately in attendance, but on his arrival pronounced life to be extinct.

An inquest was held at Brotton in Cleveland, on February 2nd, touching the death of Hugh Fraser (39) who was fatally injured at the Skinningrove Ironworks on the previous Saturday morning, whilst in obarge of an electric elevator at the gas producer.—William Wild, electrician, stated that deceased had full chaved the elevator. Hearing of the accident, witness went up the elevator into the machine house, and found Fraser on the machinery gear fastened by his clothing, which was badly torn. Witness at once secured the necessary tools to take the machinery to pieces. Deceased talked to the workmen while they were endeavouring to release him, and he told witness that in returning from an examination of the coal bunker on the elevator, he stepped on to the casing of an electric motor and slipped, falling into the moving machinery. Before going to examine the coal bunker, Fraser should have stopped the machinery, which he could have done in a second or two.—Replying to Mr. W. B. Lauder, H.M. Inspector, witness admitted that there was no controlling switch for the motor in the motor-house, and there was no fencing for the cogwheels or shafting. Fraser had been in charge of the plant only An inquest was held at Brotton-in-Cleveland, on February 2nd, wheels or shafting. Fraser had been in charge of the plant only a week, but thoroughly understood his work.—The jury returned a verdiot of "Accidental death," and suggested that H.M. Inspector

a verdict of "Accidental death," and suggested that H.M Inspector should take steps for having the machinery better protected.

An inquest was held at Westminster on 2nd inst. into the death of Frederick Charles Humphries, aged 30, a gateman employed on the Piccadilly and Brompton Railway. Humphries was missing from his train (which was coming from Finsbury Park) when it arrived at the next station after leaving Leicester Square. His body was subsequently found about 13 yards inside Leicester Square tunnel. He died in hospital next morning. The medical evidence showed that deceased was severely burned by the live rail, and his feet were run over. One of the company's electrical engineers, in giving evidence, said that this particular train was the only one of the kind running. Probably the deceased had not securely closed the sliding door, which would have a tendency to open with the train in motion. A verdict of "Accidental death" was returned.

American Electrical Development,—We have before us an interesting 20-page pamphlet, entitled "What it Has Done," the "it" being the Society for Electrical Development, Incorporated, of New York. The Society is a strong and representative organisation, whose enterprising efforts to popularise electrical service of all kinds have been frequently reviewed in our columns. The objects of the present publication are:—To inform the Society's own members of what it has done (moving picture demonstrations). The objects of the present publication are:—To inform the Society's own members of what it has done (moving picture demonstrations, publication of articles in magazines and trade journals, advertising, and other forms of publicity, "field co-operation," research departments, display service bureau, and so forth); also to act as a campaign document in interesting the men engaged in the electrical industry who are not yet members of the Society. A "National Electric Week" is now being organised. Mr. J. M. Wakeman, is the general manager (29, West 39th Street, New York).

Institution and Lecture Notes.—Institution of Electrical Engineers.—Associate Membership Examination.

—Au examination will be held on April 30th and May 1st, at the Examination Hall of the Royal College of Physicians and Surgeons, Queen's Square, Bloomebury, W.C. Should a sufficient number of candidates make application, arrangements will be made for the examination to be held concurrently in local centres. Entry forms, which must be returned not later than March let, may be obtained, together with the examination regulations, on application to the secretary of the Institution.

At the meeting of the Manchester Local Section, on Tuesday last, a paper was read by Prof. E. W. Marchant, on "Conditions affecting the Variations in Strength of Wireless Signals," and was

followed by a discussion.

A paper on "Distribution and Rise of Temperature in Field Coils." was read before the Scottish Local Section in Glasgow, on Tue-day last, by Prof. Magnus Maclean, the paper being a collaborative effort by Prof. Miclean, and Messes. D. J. M. Kellar and R. S. Bigg. Sir John Saell, the president of the Listitution. was present, together with Mr. Rowell, the secretary, and both delivered addresses.

At the meeting of the BIRMINGHAM LOCAL SECTION on Wednes lay last, a paper was read by Mr. N. Shuttleworth, M.Sc., on "Polyphase Commutator Machines and their Application." A discussion followed.

Iron and Steel Institute.-The annual meeting will be held at the Institution of Civil Engineers, London, on Toursday and Friday, May 13th and 14th. Thur-day, May 13th, has been provisionally fixed for the annual dinner, and the autumn meeting is expected to be held in London during the week ending September 25th.

Association of Mining Electrical Engineers.—At a meeting of the East of Scotland Branch, at Cowdenbeath, a paper was read by Mr. Wm. Webster, of the Lochgelly Iron Co., on "The Utility of Surface Earthing on Armoured Systems." The author quesof Surface Earthing on Armoured Systems." The author questioned the utility of elaborate surface earthing installations on completely armoured systems, and pointed out that there was no compulsion to install earth-plates underground, although it was recommended to do so should the circumstances require it. He had seen instances where much time and money had been expended on elaborate systems of surface earthing without much consideration being paid to underground conditions. The laying-out of an elaborate earthing system suggested the possibility of a large leakage current, and that, to his mind, constituted a danger even where the earthing was perfect. He was favourably disposed to the use of leakage trip gear for the prevention of dangerous leakage where the earthing was period. He was avoirable upposed the use of leakage trip gear for the prevention of dangerous leakage currents. Where these were installed, the insulation of the system would require to be kept in a higher state of efficiency, and the dangers from shock, fire, and ignition of gas or dust would be reduced to a minimum.

Rifle Shooting.—A match took place on February 4th, at Dalston, between the Electrical Press and Messrs. Siemens Bros. Dynamo Works, Ltd., the scores being :—Electrical Press, 738; Siemens Bros., 860 (10 a side). The visitors were hospitably entertained by the winning team, and the contest proved thoroughly enjoyable.

Patents and Alien Enemies.—Application has been made by Mesers. R. S. Wright and E. E. Burnside to the Board of Trade to avoid or suspend Letters Patent No. 25,101/12, granted to Bauer, for high-tension electrometers; the hearing is fixed for February 24th.

A licence has been granted to Mr. E. Mills in respect of Patent

No. 362/12 (Hinselmann).

Educational Notes .- The Appointments Board of the UNIVERSITY OF LONDON recently issued a pamphlet setting forth the aims and work of the Board, which has for its main object the the aims and work of the Board, which has for its main object the assistance of Graduates and Students of the University in securing appointments. It is stated that over 100 posts were so secured during the past year. Employers desirous of getting in touch with well-educated young men and women are invited to make use of the Register, and to make known their requirements to the Secretary of the Board at the University, South Keneington.

A foundation has been endowed by Lord Rosebery at the London School of Economics and Political Science, whereby two prizes, one of £25 and one of £10, will be awarded annually for the best monographs on a question dealing with the History, Theory, or Organisation of Inland Transport. For 1916 the subject is "Workmen's Trains." Candidates must be present or past students of the school.

of the school.

Electrical Heating.—A Committee appointed by the Stockholm electricity and gas works, for the purpose of making exact inquiries into the subject of electrical heating with the view of ascertaining its cost compared with that of other heating systems, recently issued its report. The first step that was taken was to install hot-water apparatus in certain premises, together with the system of Dr. Electron. with thermostate, according to the system of Dr. Ekström. The water was heated by coke or by electricity. During the winter the premises were heated alternately by means of two systems for two weeks at a time, during which experiments the consumption, temperatures, &c., were kept under close observation.

The experiments were carried out in two different ways. In one

case the apparatus were in partial operation during the whole day and night, and attendance was dispensed with, as the system worked automatically. In the other case, the supply of heat was cut off for the night from 5 p.m. until 7 a.m. With few exceptions the temperature in the morning was as high as 18° C. Batween

9 a m. and 5 p m. the apparatus were working automatically.
When the systems were in use the whole day and night, it was found that the consumption of 1 hestolitre of coke corresponded to 198 kw.-hours of electricity. The efficiency of the hot-water system averaged about 60 per cent.

When the current was switched off for the night, 1 hectolitre of coke was equivalent to 120 kw.-hours, representing a saving of about 40 per cent.

about 40 per cent.

As regards the capital expenditure, with consequent interest As regards the capital expenditure, with consequent interest and depreciation, the Committee arrived at the result from the experiments that the cost was about the same for both systems, and it came to a similar conclusion with regard to the cost of up-keep. With reference to the attendance, the expenses for the electrical system were practically nil, while those of the other system amounted to about 20 per cent, of the cost of the fuel.

The results derived from the experiments show that when the price of coke is 150 kr. per hl. (14.84), as much as 0.76 öre per kw.-hour can be paid for continual heating, and 1.25 öre (\$\frac{1}{2}\$1.) with 10 hours' heating. If the cost of atten ance be included, the above-mentioned figures will be raised respectively to 0.90 öre and 1.50 öre (\$\frac{1}{2}\$ krue = 100 öre = 18.1\$\frac{1}{2}\$1.)

150 öre (1 krone = 100 öre = 1 s. 1 d.)

The Committee comes to the conclusion that in consideration of the great advantages of the electrical system it ought to be possible to go even beyond those prices. Surplus electrical energy from water-power plants is regarded as the most suitable sources of supply for electrical heating. Whether more satisfactory results could be obtained by dispensing with hot water pipes and using electric radiators in the rooms was not stated, but in view of the increased efficiency of this method the results would probably be more favourable.

Appointments Vacant.—Assistant engineer (£125) for Burgh of Hamilton Electricity Supply; electrical foreman, (£280 +) for Federated Ma'ay States Government Railway; meter tester (35s) for Borough of Salford; junior assistant (£1) for Llanwrst Electric Light Works; chief inspector of railway telegraphs for Ceylon Government Railway (£250 +); junior shift engineer (30°.) for Luton Electricity Works; shift engineer (35°s.) for Colne Corporation Electricity Works. Particulars are given in our advertisement pages.

Electricity in Surgery.—The medical correspondent of the Times in Calais states that the radiographic room of the Queen Elizabeth Hospital there, which is under Belgian control, and is used for wounded Belgian soldiers, possesses an exceptionally interesting and up-to-date electrical equipment. Apparatus is any interesting and up-to-date electrical equipment. Apparatus in provided for taking instantaneous X-ray photographs, with the minimum of discomfort to the patient, and the localisation of foreign bodies is facilitated by the use of stereoscopic X-ray photographs. The water supply is sterilised with ultra-violet rays. The installation is in the charge of M. Emile Lejé t.

Compensation. — The Finance Workmen's General Purposes Committee of the Bradford Corporation has decided that in view of the large percentage of the sums claimed under the Workmen's Compensation Insurance Fund for the thace years ended March 31st, 1914, as compared with the premium income in the electricity department amongst others, the premium be increased from 12s, per cent, to 18s, per cent, for the years ending March 31st, 1915, and March 31st, 1916. The gas department rate has been increased from 12s, per cent, to 20s, per cent.

Special Services in London.—In the course of a paper read before the Telephone and Telegraph Society of London, by Mr. D. H. Kennedy (Assistant Superintendent Engineer, Post Office Engineering Department), on January 25th, interesting demonstrations were given of the working of some of the "special services" in operation in the metropolis. A test call was sent from the Lecture Hall of the Institution of Electrical Engineers to the fire brigade stations at Scotland Yard and Whitefriars; a horsed escape and a horsed fire engine from the former and a motor fire engine from the latter arrived simultaneously in 2 minutes and 20 seconds from the moment when the handle of the fire alarm was pulled, the officers entered the theatre and spoke to one of the stations at two minutes thirty-three seconds. An order was telephoned to Selfridge's, and the article required was delivered in nineteen minutes, in spite of the foggy weather; the distance traversed was 1 mile 1,500 yards, and at a preliminary trial earlier in the day the feat was accomplished within 15½ minutes.

The author gave restricted at 1.2. engine from the latter arrived simultaneously in 2 minutes and 20

The author gave particulars of the remarkably varied "special services" which are provided by the telephone and telegraph department, in connection with public business, public information, public safety, and public pleasure. It appears that as there are no fewer than 12,000 private branch exchanges in the London ares, and only 2.500 working positions at the main exchanges, the number of private exchange operators far exceeds the number of main exchange operators; 29 private exchanges have 112 operators positions and nearly 7 000 stations. The Stock Exchange and the adjoining buildings constitute the most densely thelephone area in the kingdom, possessing an extending a number of telephone operators. sessing an extraordinary number of telephne cabinete. The news services transmit on an average more than 2,000,000 words a day. services transmit on an average more than 2,000,000 words a day. It is not generally known that the department has for many years maintained the system of division bells at the Houses of Parliament; moreover, a number of Members who live within six minutes by motor-car have had installed in their houses bells connected with the system, so that they can stay at home until their presence is indispensable. Various special services have been necessitated by the war, including one for the Press Bureau, which was installed in two days; 22 cabinets are provided for the use of Press representatives, who act in accordance which was installed in two days; 22 cabinets are provided for the use of Press representatives, who act in accordance with strict rules. When a news item has been passed by the Censor, it is distributed to all the reporters, who on a given signal simultaneously rush to their respective cabinets and call up their offices. The Department also maintains a complete system of fire slarms for the London Fire Brigade, and a similar system of street pillar boxes for the City Police Ambulance service: the average time from the occurrence of an excitation to service; the average time from the occurrence of an accident to the arrival of the ambulance is under four mirutes. A larger ambulance system is also maintained for the Port of London Authority.

OUR PERSONAL COLUMN.

The Rditors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the Electbical Review posted as to their movements.

Central Station Officials .- MR, FRED. TYRRELL, aesistant engineer at Ascot electrical works, has been appointed to a similar position under the Nigerian Government at Lagos.

Mr. F. Crooks, clerk and collector to the Bridlington Corporation electricity department, applied for leave of absence in order to enlist in H.M. Forces, but the Electricity Committee is unable to consent, his services being essential to the department at the present time.

MB. H. N. NEWCOMBE has resigned his position as engineer-in-charge at the borough of Wimbledon electricity works. MR. H. OSWALD has been appointed temporary engineer-in-charge, at

£104 per annum.

MR J. ELLIS has resigned his position as shift engineer at the

Watford electricity works.

Ms. F. J. STRATFORD, of Newton Abbot, has been appointed shift engineer at the Corporation electricity works at Bexhill-

General.—There were some 400 signatories, representing commercial interests in Dublin, Belfast, Cork, Limerick and other Irish centres, to an address presented to Mr. Wm. M. MURPHY, chairman of the Dublin Tram way; Co., in the Dublin Chamber of Commerce, in recognition of his valuable work as President of the Commerce, in recognition or his valuable work as President of the Chamber and in relation to the tramway and other strikes of the year 1913. Accompanying the address were two fine portraits of Mr. Murphy, by Mr. Wm. Orpen, the distinguished Academician, one of which is to be hung in the Council Room of the Chamber. In his reply Mr. Murphy claimed that his enterprises had been free from self-seeking, and that what success had at ended them was due mainly to those associated with him. He had, he said, carried the Irish flag far afield in commercial undertakings, and had proved that an Irishman, making his headquarters and spending his life in his native land, was not handicapped to such an extent as to prevent him from successfully extending his interests to Great Britain and abroad.

The Times, in announcing the staffs of the special departments at The Times, in announcing the staffs of the special departments at the King George Hospital, says that the following three physicians have undertaken to advise as to the equipment of the X-ray department, and, in conjunction with the visiting staff, to render themselves responsible for its work:—W. Ironside Bruce, M.D., physician, X-ray department, Charing Cross Hospital; Stanley Melville, M.D., physician, X-ray department, Brompton Hospital; G. Harrison Otton, M.D., physician, X-ray department, St Mary's Hospital. The Joint Committee are advised that the expense of the establishment of this department will amount to £750.

the establishment of this department will amount to £750.

MB. F. LARGE, of Great Barrow, has been presented by his colleagues at the Helsby Works of the British Insulated and Helsby Cables, Ltd., with a case of outlery.

MB. W. MOTTERSHEAD, works foreman at the Corporation

electricity works at Tunbridge Wells, has received an appointment under the Admiralty.

The marriage took place at St. George's Church, Hanover Square, London. W., on February 2nd, of Mr. Walter T. Smith, of Messre. T. Smith & Sons, electric crane manufacturers, of Rodley, near Leeds, and Mies Beatrice May Haysom, daughter of Mr. G.o. Haysom, L.C.C., of Hayling, South Croydon.

ALDERMAN TYRRELL bas been re-elected chairman of the Belfast Corporation Tramway and Electricity Committee, and COUNCILLOB DUFF has been appointed vice-chairman.

The North-East Coast Institution of Engineers and Shipbuilders has conferred upon Lord Fisher the honorary membership of the Institute, in recognition of his support of the reform recently embodied in the Admiralty order conferring military rank upon the engineer officers of the Royal Navy.

MR. CHAS. LILL, who resigned his appointment with the Hackney Borough Council a short time ago in order to join Messrs. J. and H. Grevener, has, owing to the national crisis and with regret, severed his connection with that firm and has since been appointed engineer and manager to the Albion Electrical Co., Ltd., of 67, New Oxford Street, W.C.

Obituary.—Mr. Wm. Bulloch.—We regret to learn that the death took place, on Tuesday, at his residence, Normanhurst, Newbridge, Wolverhampton, of Mr. William Builooh, a director of the Electric Construction Co., Ltd., Bushbury, and for over 20 years manager of the company's works. The deceased gentleman attended to his business engagements so recently as Friday in last week, and it was only on Saturday he was seized with the illness which, unfortunately, proved fatal. Mr. Bulloch, who was a Scotsman, was only 44 years of sge. During the period of his management the E.C.C. works have extended and evaluated and engagement specified to the total statement of the search of the statement of the search of the s developed, and many departments have been reorganised. the keenest interest in the workmen, and was closely identified with their institute and their organised sports and recreations. For with their institute and their organised sports and recreations. For many years he was a member of the Wolverhampton Chamber of Commerce. For two years—1907 and 1908—he occupied the presidential chair, and he served on several committees, being present at one of the meetings last Wednesday week. Mr. Bulloch was also a vice-president of the Welverhampton and District Engineering Society. He will be missed in many circles, but especially at Burhbury; and sympathy will be unreservedly extended to Mrs. Bulloch and the family of five boys and one girl who mourn his decease. who mourn his decease.

MR. J. H. WADDON, J.P.—The death has taken place of MB.

JOHN HENRY WADDON, J.P., a former Mayor of Bridgwater, and

one of the pioneers of the local electric light undertaking.

Mr. A. J. Ickringill.—The death took place, on February 2nd, at Guelph, Ontario, after an operation for appendicitis, of Mr. Arthur Jas. Ickringill, a director of the Keighley (Yorks.) Electrical Engineering Co., Ltd. He was only 39 years of

MR. ARTHUR KEEN.-The death occurred on February 8th at Birmingham, at the age of 80 years, of MR. ARTHUR KEEN, of Guest, Keen & Nettlefolds and other important engineering undertikinge.

NEW COMPANIES REGISTERED.

Spicer & Co., Ltd. (189,205).—This company was registered on February 2nd, with a capital of £500 in £1 shares, to take over the business of electrical engineers carried on by Charles Gustav Louis Heim and Edward Norcok Harwood Spicer, at 1, Cottage Lane, City Road, E.C., as "Spicer & Co." The subscribers (with one share each) are: E. N. H. Spier, 1, Cottage Lane, City Road, E.C., manufacturer; C. G. L. Heim, 1, Cottage Lane, City Road, E.C., merchant, Private company. The number of directors is not to be less than two or more than five; the first are not named. Solicitors: Bate & Co., 35, Bedford Row, W.C.

Standard Insulator Co., Ltd. (139,241).—This company was registered on February 4th, with a capital of £100 in £1 shares, to carry on the business of manufacturers and proprietors of and dealers in magnetos, magneto parts and accessories, motors, motor and other carriages, vans, wagons, motors, launches and fixing machines, electricians, engineers, rubber manufacturers, etc. The subscribers (with one share each) are: H. Doe, 14, Regent Street, S.W., clerk; R. Budgen, 96, Mildenhall Road, Clapton, N.E., clerk. Private company. Table "A" mainly applies. Solicitors: J. B. & F. Purchase, 14, Regent Street, S.W.

E. S. Co., Ltd. (139,230).—This company was registered on February 4th, with a capital of £2,000 in £1 shares, to take over from E. C. Beman the business of an electrical supply agent and wholesale factor carried on at 53, Victoria Street, Westminster, as the Electrical Supplies Co. The subscribers (with one share each) are: E. C. Beman, 53, Victoria Street, Westminster, S.W., electrical engineer; F. J. Roden, 53, Victoria Street, Westminster, S.W., traveller. Private company. The number of directors is not to be less than two or more than five; the first are E. C. Beman and F. J. Roden (both permanent, with £260 and £208 per annum respectively as remuneration). Qualification £100. Registered office: 53, Victoria Street, Westminster. minster

Arthur Lyon & Wrench, Ltd. (139,224).—This company was registered on February 4th, with a capital of £12,000 in £1 shares, to take over as going concerns the businesses carried on at 5. Crawford Passage, Farringdon Road, E.C., and elsewhere, as the "Wrench Manufacturing Co.," and at Caxton House, Westminster, as "Arthur Lyon & Co.," to carry on the business of manufacturers of cinema requisites, and electro-mechanical engineers, manufacturers of lamps, light-projecting apparatus, dynamos, signalling apparatus, searchlights, are projectors, oxy-hydrogen and oxy-petrol lighting sets for motor curs, motor lorries, motor locomotives, aeroplanes, monoplanes, hydroplanes, biplanes, etc., and to adopt agreements (1) with H. H. Wrench, and (2) with A. A. Lyon and Goldenlyte, Ltd. The subscribers (with one share each are: H. H. Wrench, Kensington Palace Mansions, W., manufacturer; A. A. Lyon, Caxton House, Westminster, engineer, Private company. The number of directors is not to be less than three or more than seven; the first are H. H. Wrench, A. A. Lyon, W. Engelke, and A. F. Burman (all permanent), Qualification, 500 ordinary shares. Remuneration as fixed by the company. Registered office: Caxton House, Westmisnter.

Kawwright Engineering Co., Ltd. (139, 957) —This company.

Kaywright Engineering Co., Ltd. (139,257).—This compay was registered on February 6th, with a capital of £500 in £1 shares, to carry on the business of electrical and mechanical engineers, builders, contractors, electricians, producers and suppliers of electricity, etc. The subscribers (with one share each) are: R. Orwin, 42, Elvedon Road, Palmers Green, N., engineer: F. R. Orwin, 42, Elvedon Green, N., pattern maker. Private company. Table "A" mainly applies. Solicitors: Davidson & Morriss, 40-42, Queen Victoria Street, E.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

St. Helens Cable & Rubber Co., Ltd. (87,774).—Capital, £10,000 in £1 shares. Return dated Dec. 31st, 1914. All shares taken up; £10,000 paid. Mortgages and charges, £148,464.

Perfect Burglar Alarm Co., Ltd. (recently known as Lichtenfeld Burglar Alarm Co., Ltd.), (112.522).—Capital, £4,000 in £1 shares (1.000 pref.). Return dated Dec. 18th, 1914. 230 pref. and 1.710 ord. shares taken up; £1 per share called up on 1.210 shares and 5s, per share on 230 shares; £1,267 [0s. paid; £500 considered as paid on 500 shares. Mortgages and charges, nil. Name changed on Jan. 13th, 1915.

Provincial Tramways Co., Ltd. (6.445).—Capital, £275,440, in 10.000 pref. shares of £10 each and 175,440 ord. shares of £1 each. Return dated Dec. 10th, 1914. 10.000 pref. and 124,560 ord. shares taken up: £10 per share called up on 3.814 pref. and £1 per share on 124,560 ord. shares: £162,700 paid; £61,860 considered as paid on 6,186 pref. shares. Mortgages and charges, £175,000.

Gosport & Alverstoke Electric Lighting Co., Ltd. (82,693).

-Capital, £5,000 in £10 shares. Return dated Dec. 11th, 1914. All shares taken up; £5,000 paid. Mortgages and charges, nil.

Ferranti, Ltd. (83,718).—Capital, £130,000 in £1 shares (160,000 pref., 60,000 ord., and 10,000 defd.). Return dated Nov. 13th, 1914. 60,000 pref., 53,374 ord., and 10,000 defd. shares taken up; £123,374 considered as paid. Mortgages and charges, £157,902 11s.

CITY NOTES.

Yorkshire Electric Power Co.

THE directors report that for the year ending December 31st, 1914, the net profit on the revenue secount, after payment of mortgage interest for the three years ending December 31st, is as follows:—1912, £7,361; 1913, £15,401; 1914, £20,535 plus £4,188 brought forward, making £24,723. Deducting the dividend paid to June 30th, 1914, on the preference shares, £4,392, and on the ordinary shares £2,552, there remains a disposable balance of £17,778, which is to be death with these.—Dividend for the half recognized is to be dealt with thus:—Dividend for the half-year ending December 31st, 1914, at the rate on the preference shares (6 per cent.). £4.979; write off the bonus paid upon the second mortgages, £2.250; transfer to general reserve fund, £7,500; carry forward £3,049. In view of the progress of the company during the first six months of 1914, the directors felt justified in July in paying a dividend at the rate of 2 per cent par annum a rate which they dividend at the rate of 2 per cent, per annum, a rate which they had reason to believe would be maintained for the whole year.

Immediately following this the outbreak of war caused a serious reduction in the current used by customers during the months of reduction in the current used by customers during the months of August and September, and checked the expanding revenues of the company. For the last three months of the year the revenue has again shown considerable improvement, being a substantial increase on that of the corresponding months of 1913. Owing to the financial caution, which is specially advisable at present, the directors recommend the shareholders to be satisfied with the dividend already paid (equal to 1 per cent, for the whole year), so as to strengthen the position of the company, by placing £7,500 to reserve, raising this fund to £12,500.

reserve, raising this fund to £12,500.

On February 17th of last year the proprietors authorised the issue of a further 10,000 6 per cent. preference shares of £5 each, making a total authorised issue of £320,000. Applications were made by holders of second mortised issue of £320,000. Applications were made by holders of second mortised gages for £35,405, making, with further applications which have since been received for these and the balance of the former issue, a total of £56,865 taken up during 1914. Applications are being received for the balance, which st this date is £13,090.

The second mortgages, which, with the bonus upon them, amounted to £47,250, have been repaid. In order to give further security to the company's bankers, the mortgages have been t ansferred to them instead of being allowed to lapse.

To provide the capital required for the additional plants and machinery installed at Barugh power station, the Yorkshire Waste Heat Co., Ltd. (of which the power company is the sole shareholder) sanctioned an issue during 1914 of a further £22,000 of 5½ per cent. first mortgage debenture stock of that undertaking.

Out of the rent paid for the use of the Barugh station a sinking fund is saide by the Waste Heat Co. to repay their debenture stock on December 31st, 1937. The sum accommutated to December 31st, 1914, amounts to £1,391.

Electrical Distribution of Yorkshire, Ltd., now hold 16 Electric Lighting Provisional Orders, for which a bulk supply of energy is taken from the power company. In order to extend their operations, an allotment of £12 500 ordinary capital was made to their shareholders during the year. The business of that company has throughout shown steady and advancing progress, and the directors decided to increase the holding of the Power Company by taking up further capital.

The meeting will be held at Leeds on Tuesday, February 16th.

St. James' and Pall Mall Electric Light Co., Ltd.

THE directors report that the connections, which at the end of 1913 were 15,119 kW., have been increased to 15,423 kW. and 11,171,348 units were supplied to consumers. The Central Electric Supplier Co. Ltd. has declared to 2014 and 2014 11,171,348 units were supplied to consumers. The Central Electric Supply Co., Ltd., has declared a dividend of 5 per cent. on the ordinary shares and £2,500 (less tax) will be payable to this company. The revenue derived from the sale of electricity has been greatly reduced by the war. The company is associated with other London electric supply undertakings in the promotion of a Bill entitled the London Electric Supply (No. 2) Bill. The net profits for the year 1914, applicable to dividends on shares, amount to £27,133 plus £2,283 brought forward. Deducting the interim dividends paid in August last at the rate of 7 per cent. on preference shares, £3,500, and 10 per cent. on ordinary shares, £10,000, £15,917 remains to be dealt with. After paying the further 7 per cent. preference dividend, a dividend on the ordinary shares for the second half-year of 5s, per share is recommended, making, with the interim dividend paid in August last, a total distribution of 10 per cent. for the year, £10,000, leaving £2,417 to be carried forward. Lanarkshire Tramways Co.

FOR the half-year ended December 31st, 1914, the revenue was £48,583, and the expenses were £31,544, leaving £17,039. After meeting debenture and other interest charges and contributions to local authorities there remains £13.873, plus £5,645 brought forward. £9,000 has been placed to reserve for depreciation. £9,432 is absorbed by dividend at the rate of 5½ per cent. per annum for the half-year on the share capital, £167 is paid to directors, and £919 is carried to revenue new account. The revenue shows an increase of £192, and the expenses an increase of £5,088, as compared with the revenue and expenses for the corresponding halfpared with the revenue and expenses for the corresponding half-year of 1913. For the month of July the traffic receipts were over £1,000 in excess of the figures for the corresponding month of 1913, but from the outbreak of the war there was a continuous falling off in the receipts, and it is estimated that there was a decrease in the revenue of fully £4,000 on this account. The increase in expenses was mainly due to operating the lines leased from the Lauark County Council, which were not in operation for the full half-year of 1913, and to heavier maintenance charges for permanent way, rolling stock, No. A large number of employés have joined the Colours, and allowances to wives and dependents to December 31st cost £329. Payments to local authorities for the year will amount to £1,730, of which £1,433 was reserved in the accounts to June 30th, leaving a charge in the past half-year's accounts to June 30th, leaving a charge in the past half-year's accounts of £297. A dividend for the half-year at the rate of 5½ per cent. per annum is recommended, making 5¾ per cent. for the year.

Half-year ended—	Miles open.	Passengers carried.	Traffic receipts.	Average fare.	Car- mileage.	No. o

Dublin United Tramways Co., Ltd.

At the annual meeting, held on 3rd inst. in Dublin, the chairman MB. W. M. MURPHY, said the expenditure on capital account had exceeded the receipts by £68,836, but against this the company held £39,400 in redeemed bonds. Workshops at Ballsbridge had been extended, and £1,871 worth of additional machinery had been erected at Blackrock sub-station. On revenue account there were gross receipts of £3,066 in excess of 1912, and £24,166 in excess of 1913—the great strike year. This showed that their business had not been seriously affected by the war. Traffic in fact, showed great vitality, as for last month (January) there was an increase of £2,109 over January, 1914, and £960 over January, 1912. Receipts from goods traffic had grown to £1,550—doubling since 1912—and parcels traffic reached £7,129. The working and general expenses, however, had increased by £14 378. A sum of £14,427 had been contributed to local authorities in respect of wayleaves for the year. The company now paid rates on a wayleaves for the year. The company now paid rates on a \$41,000 valuation—an increase from £30,000 in two years. Operation cost £567 more than in 1912, and expenditure under Operation cost £567 more than in 1912, and expenditure under maintenance showed, apart from rail renewal, a net increase of £4,749. Increases for renewal and maintenance of track, plant and rolling stock, must be looked forward to, but Mr. Murphy anticipated increased receipts to meet increasing expenses, maintaining net earnings. The balance for appropriation was £98,047, and after deducting preference and interim dividends, they were paying a final dividend of 5 per cent. per annum on the ordinary shares, leaving a surplus on profit and loss account of £34,366, the most urgent claim on the disposal of which was for renewal of portion of the track. They were, the chairman added, substituting a rail of 105 lb, to the yard for one of 92 lb. originally laid down. They had adopted the Thermit system of welding. A reserve of £40,768 had been depleted by £18 277 in respect of track renewal, and £18,000 would be given from the surplus to restore that fund, while £5,000 would go to general reserve, which would then amount to £55,679, and £11,366 would be carried forward, being £1,409 more than they carried forward from last account.

National Gas Engine Co., Ltd.—The directors report that the net profit for the year ended December, 1914, after providing amply for depreciation of buildings, tools, &c., and allowing for management salaries and income-tax, is £62,257. Interim dividends for the six months to June 30th, amounting to £28,500, dividends for the six months to June 30th, amounting to £28,500, being at the rate of 5 per cent. per annum on the preference shares, and 7½ per cent. per annum on the ordinary shares, were paid on July 31st, 1914, leaving a balance of £33,757, which, added to £11,903 brought forward, makes a total of £45,660 to be dealt with. The directors recommend the payment of a final dividend at the rate of 5 per cent. per annum on the preference shares and one of 7½ per cent. per annum on the ordinary shares, both less income-tax, for the six months ended December 31st, 1914. This will absorb £28,500, and leave £17,160, which it is proposed to carry forward. carry forward.

Companies Struck off the Register.—The following companies have been struck off the Register, and are accordingly dissolved :-

Automatic Lock Nut Co.
British Medical Electric Appliances Co.
Dioptric Sign Co.
Electrical Power Users' Association.
Electrical Power Users' Association.
Electric Fire Prevention Appliances and General Mig. Co.
Institution of Signal Engineers (Inc.).
International Marine Signal and Carbide Co.
International Syndicate for Electric Water-Power and Public Works Concessions.
London Electric Treatment Institu'e.
Machinery. Machinery.
Mica Mines.
Never-Stid Band Manufacturing Co.
North Lancashire Tramways Power and Construction Syndicate.
Power Engineers.
Star Electric Light Co.

Official Notices re Companies.—The following companies will be struck off the register at the expiration of three months unless cause is shown to the contrary:

nless cause is shown to the contrary:

Alkaline Accumulators Paul Gouin.
Anglo-Brazilian Power and Shipping Corporation.
Beam Co. (British Electrical and Mechanical Co.)
Blast Furnace Power Syndicate.
Controllers (London).
County E certic Traction Co.
Electric Batteries and Carbons.
Leeds Electric Co.
Mego-Acoustics.
Schoenfeld Universal Oil Filter Co.
Silent Gear Syndicate.
Houthwold Electricity Works.
Witney Electric Supply Co.

Smithfield Markets Electric Supply Co., Ltd.—The Smithheid markets Electric Supply Co., Ltd.—The directors report that the gross profit for the year 1914 amounts to £4,576, compared with £5,764 and the net profit to £3,139, compared with £4,237 last year. A further sum of £400 has been placed to the debenture stock redemption fund (making a total of £793) and £1,000 to depreciation account. The available balance, including £791 brought in, is £2,530. A dividend at the rate of 2 per cent. per annum, on the ordinary shares will absorb £1,200, leaving £1,330 to correspondent. \$1,330 to carry forward.

Underground Electric Railways Co. of London, Ltd. —Subject to final audit, the revenue of the Underground Co. will enable it to pay full interest to December 31st, 1914, on its 6 per cent. first cumulative income debenture stock and on its 6 per cent. income bonds, and to carry forward about £35,000.

Central Electric Supply Co., Ltd.—The directors' report for 1914 states that energy has been supplied to the Westminster, St. James' and Pall Mall, and the Chelsea Companies to an amount of 28 967,111 units. After making a full allowance for sinking fund and depreciation the net balance for the year 1914 is £4,999. After paying of a dividend at the rate of 5 per cent. on the ordinary shares for the year £5,000, £6 remains to carry forward. The Right Hon. Wm. Hayes Fisher has been appointed a director.

Stock Exchange Notices.—Application has been made to the Committee to appoint a special settling day in and to grant a quotation to-

General Electric Co., Ltd.—Further issue of 10,000 ordinary shares of £10 each, fully-paid: and 80,000 6 per cent. cum. pref. shares of £10 each, fully-paid.

And to allow the following securities to be quoted in the Official

Orompton & Co., Ltd.—79,589 or Jinary shares of £1 each, fully-paid, Nos. 1 to 79,539; and 186,000 pref. shares of £1 each, fully-paid, Nos. 1 to 186,000 (renewed applies ton).

General Electric Co., Ltd.—40,000 ordinary shares of £10 each, fully-paid.

Central London Railway Co.—The directors recommend the following dividends:

On the undivided ordinary stock for the six months ended December Sist, 1914 at the rate of 2½ per cent. per annum, making with the interim dividend of £3 per cent. per annum, a dividend for the year 1914 of 2½ per cent. On the preferred ordinary stock for the six months ended December Sist, 1914, at the rate of £4 per cent, per annum, making with the interim dividend, a dividend for the year 1914 of £4 per cent.

On the deferred ordinary stock for the year ended December Sitt, 1914, a dividend of 1½ per cent., carrying forward £15,418.

City and South London Railway Co.—The directors recommend a dividend on the 5 per cent. preference stocks 1891 and 1896 for the six months ended December 31st, 1914, at the a dividend for the year 1914 of 5 per cent. No dividend will be paid on the 5 per cent. preference stocks 1901 and 1903 for the half-year ended December 31st, 1914.

City of Buenos Ayres Tramways Co. (1904), Ltd. The report for the year ended December 31st, 1914, states that the annuity payable by the Anglo-Argentine Tramways Co., Ltd., has been received, and the net reverue for the year has amounted to £67,392. Interim dividends paid for the nine months ending September 30th, 1914, absorbed £46 500, leaving £20,892. The directors recommend a final dividend of 1s. 3d. per share (making 5s. per share—5 per cent. per annum—less income tax) for the year, absorbing £15,500, and £5,200 is to be transferred to general amortisation fund, leaving £192 to be carried forward. Annual meeting, February 15th.

Tyneside Tramways and Tramroads Co., The accounts for the past half-year show a divisible balance of £6,241. Traffic receipts showing an increase of £2,263 compared with 1913. A dividend at the rate of 3 per cent is proposed on the ordinary shares; £1,400 is to be placed to reserve and renewals fund, and £1,500 to special reserve, carrying forward £731.

London Electric Supply Corporation, Ltd.—The company has issued the following statement:-

	1914.	1918.
Profit	£93,234	£71,753
Dividend on ordinary shares	4 %	3 %
Sinking fund	£12,000	£12,000
Reserve account	10,000	Nil.
Contingencies account	7,000	3,000
Carry forward	8,828	5,098

Metropolitan District Railway Co.—The directors recommend the payments of dividends in full on the 4 per cent. guaranteed stock, and on the 4½ per cent. preference stock; and on the 5 per cent. second preference stock for the past six months at the rate of 1 per cent. per annum, making for the year 2 per cent.

London Electric Railway Co.-The directors recommend a dividend on the ordinary shares for the past six months at the rate of ‡ per cent. per annum, making for the year ‡ per cent.

Parsons Marine Steam Turbine Co., Ltd.—The directors announce an interim dividend of 12 per cent.

STOCKS AND SHARES.

Tuesday Evening.

From the general Stock Exchange point of view, the most interesting points of the moment are those concerned with the Home Railway dividends. People were completely in the dark as to what the companies were likely to pay, the only guide being an assurance by the Government that traffics would be made up to a certain amount. This, of course, did not pledge the directors to maintain previous dividends. In two or three cases the announcements are satisfactory, but in the majority, the results are regarded as somewhat disappointing.

With reference to those with which this page is immediately concerned, the various distributions declared by the Tube Railways cannot be held as good. In one case—that of the Underground Electric Railways of London—the company has fulfilled hopeful anticipations by announcing the payment of the full dividend on the 6 per cent. income bonds, whereas some few weeks ago the idea was current that this rate might be cut down to 41 or 5 per cent.

few weeks ago the idea was current that this rate might be cut down to 4½ or 5 per cent.

On the other hand, the Central London and the City and South London publish poor performances; and none too much satisfaction is felt with that of the London Electric Railways. Prices have mostly given way, and the Underground stocks have joined with the rest of the Home Railway group in showing decided signs of heaviness. The public decline to buy Home Railway ordinary and deferred stocks—at least, so the level of present prices indicates—unless the investments yield about 6 per cent. on the money; and inasmuch as this return can be obtained from several of the best-class ordinary shares in the steam-list, it is not surprising that others should give in the steam-list, it is not surprising that others should give

Oddly enough, however, the preference stocks of the Home Railway companies are in good demand; and the discount of 2 points on Metropolitan 5 per cent. preference has given place to a small premium, while the new London and South Western

2 points on Metropolitan 5 per cent. preference has given place to a small premium, while the new London and South Western preference, issued at 99½ to pay for electrification work, has risen to 106½. It will be seen from the subjoined price lists how the ordinary stocks have given way:—

Electricity supply shares lean a little to the dullish side. Westminster preference, for instance, have lost the small fraction they picked up last week. Kensingtons are 5s. down. The report of the St. James' Company is considered satisfactory enough in the circumstances. But a certain amount of anxiety is expressed as to the position of all the electric lighting companies, in regard to their holding of coal, and to the prices at which they will have to enter into new contracts.

The Borough of Wimbledon circularised its inhabitants with the intimation that, owing to the scarcity of coal, it might be necessary to curtail the supply of electric current. Inland Revenue offices in the City display small handbills urging economy in the use of electric light. One, at least, of the gas companies has issued a very strongly-worded appeal to its stockholders and consumers, begging them to use what influence they can to bring the matter before Parliament. All things considered, these are not good days for illumination industries.

The Bournemouth and Poole Company is offering its share-holders 2,500 6 per cent. second preference shares of £10 each at par, and, considering the excellence of the security, there can be little doubt about the success of the issue, which is one of the first, by the way, to receive the Treasury imprimatur of permission to appear. There is no premium on the shares in the market, but as a 6 per cent. investment of their class they will rank high. The Melbourne Electric Supply issue achieved distinct success, and the shares are already 7s. 6d. premium in the market, the old stock keeping about 1/0. Manufacturing shares are quiet. Electric Constructions continued to harden, and British Westinghouse preference wavered a trifle.

The foreign tramway list shows Brazil Tractions down a further 2 points, which leaves the price 54½. Mexican issues are also weak. Illustration of the state of the market may be seen in the fact that for one of the Mexican bonds, which was quoted nominally at 50, an insistent seller the other day obtained no more than 25. The condition of the unfortunate country at present holds out no hopes of improvement. Adecountry at present holds out no hopes of improvement. Adecountry at present holds out no hopes of improvement. Adecountry at present holds out no hopes of improvement. Adecountry at present holds out no hopes of improvement. Adecountry at present holds out no hopes of improvement. Adecountry at present holds out no hopes of improvement. Adecountry at present holds out no hopes of improvement. Adecountry at present holds out no hopes of improvement. Adecountry at present holds out no hopes of improvement and the advancing of the stock which was offered at 101 free of stamp duty. The Anglo-Argentine debenture stock have given way a point or so. The Bournemouth and Poole Company is offering its share-

Telegraph stocks and shares are firm, and the advancing tendency recently shown is fully maintained. Rises have occurred this week in Anglo "B," "China" shares, Eastern ordinary, Globe ordinary and Panamas; and the only fail worth noticing is £1 in Great Northerns. Marconis hardened a shade on buying, said to be inspired by Irish sources. Americans are steady at 10s., Canadians at 4s. 9d. Oriental Telephone preference rose \$ on a small enquiry. The difficulty is to buy stock in any good-class concern; and would-be purchasers of £100 of this, that, or the other stock in the telegraph list have been disappointed, several times this week, in not being able to get their stock even at the higher of the prices quoted.

in not being able to get their stock even at the higher of the prices quoted.

The armament group shows slackness, and there has been quiet pressure to sell Vickers and Armstrongs, no doubt on behalf of those who bought the shares lower down and are content to take profits. The rubber market received an unpleasant surprise early this week in the issue by one of the leading companies of new capital allotted to its proprietors by way of bonus, though the value of the gift was quickly modified by the market's putting down the price of the old shares to within a florin of the new. Rubber itself is steady, and the best-class shares attract a fair amount of investment attention in the provinces.

in the provinces.

RUSSIA'S IMPORTATION OF ELECTRICAL GOODS.

THE past few years have been characterised by a great rise in the importation of merchandise into Russia. The average for the THE past few years have been characterised by a great rise in the importation of merchandise into Russia. The average for the five years 1939 13 was 1,004,000,000 roubles, against 646,000,000 roubles in the immediately preceding five years. The largest importation has been in fini-hed goods; these rose by 92 per cent in the last five years named over the corresponding importations of the preceding five years, whereas the rise in the importation of raw materials in the same space of time was only 45 per cent. But no class of goods has above such a great 45 per cent. But no class of goods has shown such a great advance in the importation movement into Russia as the products of the electrical industry. The average annual importation during the last fiv: years, compared with the preceding five years, has grown by about three times, or to 15 200 000 roubles value from 5,500.00 roubles. The following table (from the Electritfrom 5,500.000 roubles. The following table (from the Electrit-chestro) shows the importation into Russis of electrical goods along with the importation of all other kinds of metal goods:—

TABLE I.-TEN YEARS' IMPORTATION INTO RUSSIA.

		Electrical goods. Roubles.	All other goods made of meta Roubles.
1904	•••	4.472.000	96,167,000
1905	•••	4,562 000	100,276,000
1906	•••	5,567,000	106,969,000
1907	•••	5,759,000	117,908,000
1908	•••	7,073,000	129,616,000
1909	•••	8,316,000	151,581,000
1910	•••	10,888,000	186 006,000
1911	•••	14,342,000	226 879,000
1912	,	17,014,000	229,201,000
1913	•••	25,210,000	259,718,000

Thus, the table shows that the importation of both categories of goods has risen from year to year, but whereas the importation of electrical goods for the ten years figured in the table rose from 4.500,000 roubles value to 25,200,000 value, or, five and a half times, the importation of general metal goods rose only two and a half times.

Table II gives the importation of electrical products from the time of the introduction of the 1906 tariff according to classification. With the generally very significant increase in the consumption of electrical products, the importation from abroad of some goods in this group is relatively small, as the demand is covered by the home production. The importation of insulated copper wire for the past few years has not exceeded 10,000 poods; the demand for electrical cables is atmost entirely supplied from the home production. In the year 1913 only 8,000 poods were imported, whilst 10 to 15 years ago the annual importation was about 150,000 poods. Similarly, the home manufacture provides accumulators and telephone and telegraph apparatus. Of the accumulators received of recent years, less than 2,000 poods the accumulators received of recent years, less than 2,000 poods have been imported, and of telephone and telegraph apparatus only 7,000 to 8,000 poods. German statistics show respecting this item that it is telephone apparatus rather than telegraph apparatus that is imported.

The importation of electric cars compared with the home production is insignificant; the number imported in 1913 was only 106. The total value of all the goods enumerated, namely, insulated wire, cables, accumulators, telephone and telegraph apparatus, and electric railway cars, in 1913, does not exceed 1,500,000 roubles out of a total importation of electrical goods

valued at 25,200,000 roubles.

valued at 25,200,000 roubles.

The importation of incandescent electric lamps amounted in 1913 to 30,000 poods against 5,600 poods in 1906, and the corresponding values were 4,600,000 roubles and 400,000 roubles respectively. It is mostly metal-filament lamps that are imported, namely, 23,000 poods against 4,000 poods with carbon filaments. Until the introduction of the law of May 28th, 1912, o.s., all lamps in cases paid a duty of 30 roubles per pood; but the law referred to made the duty 65 roubles per pood for metal-filament lamps.

Germany had an exceptional position in the supply of electric

Germany had an exceptional position in the supply of electric aterial to Russia. As can be seen from the following table, her material to Russia. material to Russia. As can be seen from the following table, her part amounted to 80 per cent. to 90 per cent. of the importation and the relative position of Germany improved year by year, whilst the importation from other countries improved at a very slow rate or did not improve at all. It was only in the importation of telephonic apparatus that Germany suffered very serious competition from Sweden.

Total value in 1,000's of ro	ubles	5,567	5,759	7,073	8,316	10,888	14,342	17,014	25,240

^{*} This includes lamps with carbon filaments, 4,000 poods, and with m tal filaments, 23 000 poods.

Recently published data show that the movement has continued even into the year 1914. Thus, from J musty to July the figures were 14,852 000 roubles, against 12,142,000 roubles in the first seven months of 1913, and 9,460,000 roubles in the first seven months of 1912.

Great attention, says the article, must be paid to the exceptional importation of some goods when the new treaties come to be made after the war. Include scent lamps, for example, may be made easier to he produced in Russia by the imposition of higher tariffs. Germany's electrical business profits principally by the free impor-

tation of copper. In Russia the duty on copper in 1905 was 3 roubles 75 copecks to 5 roubles per pood; and the price is one and a half times dearer than in Germany or England, notwithstanding the increase in the smelting of copper in Russia itself.

TABLE III.—IMPORTATION PER COUNTRY IN 1,000's of Poods. Figures per country for 1913 not yet published.

m.	first position in the 1	iak a s i		····	a h. a	

The first position in the list of imports is occupied by dynamoelectric machines and electromotors, the importation which has
increased steadily for years—namely, from 83 000 poods, value
1,500,000 roubles, in 1903, to 383,000 poods, value 9,600,000 roubles,
in 1913. The importation of transformers during 1913 was
32,000 poods' weight, of value 704,000 roubles. Dynamos and
transformers bear a Customu duty of 8 roubles 50 copecks
per pood, or from 30 to 36 per cent. on the value; but
parts of dynamos, machines and transformers are imported
to a very slight extent. The second position in the list
is occupied by sundry items grouped under one tariff and
statistical denomination—electrical switches, keys, fuses, incandescent lamp sockets, rheostats and commutators of all kinds, complete and in parts, electric and pneumatic bells, and accessories for
electrical signalling, the importation of which in the year 1913

amounted to 230,000 poods, value 6,600,000 roubles, against 24,000 poods, value 700,000 roubles only, in 1906. All these goods bear a duty of 9 roubles per pood or 28 to 33 per cent. of their gross value.

The importation of electrical measuring instruments, amperemeters, wattmeters, voltmeters, &c., during the year 1913 made a total of 1,500,000 roubles' value, against only 200,000 roubles' value seven years before. The duty on these is 12 roubles per pood or 26 to 28 per cent. of the imported value.

TRADE STATISTICS OF CANADA.

The following figures, showing the imports into and exports from Canada of electrical and similar materials during the year ended March 31st, 1914, are taken from the recently issued trade statistics. Figures for the year 1912-13 are given for purposes of comparison, and notes of any increases or decreases have been added.

CABLES.

The paper on "Cables," read before the Scottish Local Section of the Institution of Electrical Engineers by Mr. C. J. Beaver, was discussed at a meeting in Edinburgh on Jan. 12th. (For abstract of the paper, see Elec. Rev., Nov. 20th and 17th and

27th and Dec. 4th, 1914).

Mr. D. A. Starr (Glasgow) thought it very doubtful whether in Britain a 50 or 100-kilovolt transmission scheme could be justified. The plant capacity required for charging the cables alone would present difficulties which considerations of sound finance could scarcely surmount. Having regard to our extensions of sound finance could scarcely surmount. finance could scarcely surmount. Having regard to our extensive coalfields and our readily accessible seaboard, it would seem to be a sounder proposition to select a power station site with abundant condensing water and the use of seaborne coal, and to generate at a pressure not exceeding 20,000 volts rather than to select a site at a remote coalfield and transmit at 50,000 or 100,000 volts. It was a common experience with three-core paper-insulated cables which had been so built as not to exclude all interstices in which air might find a lodgment, that serious troubles arose at the end boxes due to the imprisoned air expanding under rising temperature. This air found its easiest exame through the compound in the end not to exclude all interstices in which air might find a lodgment, that serious troubles arose at the end boxes due to the imprisoned air expanding under rising temperature. This air found its easiest escape through the compound in the end boxes, leaving a pin hole in its path through which damp air might be drawn when the temperature of the cable returned to normal. Very often the end-box design was blamed for what was really an inherent defect in the design or the manufacture of the cable. The general impression amongst engineers in this country was that pure manilla paper only should be used for cable inanufacture; Dr. Borel had expressed the opinion that a pure manilla paper was much inferior to a manilla with a small proportion of wood pulp, stating that pure manilla was not sufficiently porous to absorb the necessary quantity of the insulating oil or compound, and that from his experience extending over many years he did not approve of pure manilla. Regarding the case of alleged mechanical damage at Manchester, it would appear that the trouble experienced was more likely to be caused by the accession of moisture through the joints in the troughing assisted, probably, by the presence of cable supports. It seemed highly improbable that the cable and troughing would be displaced, as obviously the ground under the troughing must have yielded by a corresponding amount. The corrosion of lead sheathing at troughing joints was no new phenomenon, and could easily be got over by a modification of the design of lead sheathing at troughing joints was no new phenomenon, and could easily be got over by a modification of the design of support used for keeping the cable central with the troughing. The real danger of wooden bridge pieces lay in the fact that it was almost impossible to eliminate the free acids in the wood. In the Ruthven-Murray bridge-piece steel was used, and the approximate the contract was accounted. and the support was so shaped as to sling the cable from the sides of the trough. Owing to the temporary failure of an important feeder the remaining feeders might be required to important feeder the remaining feeders might be required to transmit considerably more than their normal current for several hours; whilst paper-insulated cables could withstand such abnormal conditions without detriment, bitumen cables were sometimes irreparably damaged due to the conductors becoming decentralised through overheating. For this reason their use could not be recommended except in cases where they had to perform some well-defined service, and where discriminating cut-outs could be depended upon to protect them from themselves.

Mr. J. M. Munro (Glasgow) said that the lead sheathing of

Mr. J. M. Munro (Glasgow) said that the lead sheathing of cables was returning to its own again now that safeguards were provided against leakage of current on to and from the sheath. But the inelasticity of lead and its consequent tendency to harden and creep and crack under mechanical stresses due to vibration, temperature variation or rough handling somewhat limited its use. Equipotential points also altered, not only with the growth of a network, but hourly with the diversity of load. It was disconcerting to hear of the hydrolysis of vulcanised bitumen, but he still imagined that moisture, even if slightly alkaline, but without current leakage, would not deeply injure vulcanised bitumen within any period of time likely to trouble the engineer who laid the cable. In all kinds of cable he set store by the filling of interstices between the wires of the core. There was need also for non-hygroscopic coverings to take the place of tape and braiding. Perhaps bitumen should be more largely used as a loading for rubber mixtures for cables, while what was known as cab-tire sheathing seemed likely to prove itself a distinct addition to the resources of those responsible for cables other than the underground type. Mr. J. M. Munro (Glasgow) said that the lead sheathing of

than the underground type.

than the underground type.

Mr. R. B. MITCHELL pointed out that the author, in referring to cables suitable for pressures of 20 kilovolts, stated that makers had found no difficulty in keeping the dimensions of their cables within the limits of ordinary installation practice. It seemed to him that if the present British standards were adhered to, i.e., if cables for 20 to 30 kilovolts had dielectric thickness in proportion to existing standards for 6 and 11 kilovolts, the result would be cables of unwieldy proportions. He found that a 2 sq. in, 3-core cable lead-covered and armoured for 30,000 volts could not be drawn into a 4 in. duct; without the armour it could be. The limiting size seemed to him to be that which could be got into a 4 in. duct. It had been suggested to him that 11,000-volt cable made to British standards would work quite safely at 20,000 volts. Time would show if that opinion was correct. The author stated that there was a much better chance of making a lead-sleeve joint show if that opinion was correct. The author stated that there was a much better chance of making a lead-sleeve joint watertight than a cast-iron box; but the wiped joints on

lead sleeves could not always be relied upon, even if the highest class of labour was employed. In Glasgow this difficulty had been got over; a cast-iron sleeve was used, the ends being joined solid on to the lead and armour of the cable by being joined solid on to the lead and armour of the cable by means of cast lead, i.e.; lead in a molten state was run into a means of cast lead, i.e.; lead in a molten state was run into a means of cast lead, i.e.; lead in a molten state was run into a means of cast lead, i.e.; lead in a molten state was run into a pressure over 100 lb.; no special labour was required, and pressure over 100 lb.; no special labour was required, and pressure over the being control only for highwith wiped joints. These joints were used not only for highwith wiped joints. These joints were used not only for highwith wiped olints. These joints were used not only for highwith wiped olints. These joints were used not only for highwith wiped joints. These joints were used not only for highwith wiped joints. These joints were used not only for highwith wiped joints. These joints were used not only for highwith with sum of the ground. The covered and armoured cables aid direct in the ground. The unsatisfactory, more particularly with small cables. The arc lamps circuits over the whole city were composed of bitumen cables drawn into iron pipes. The bitumen was found to cables drawn into iron pipes. The bitumen was found to cables drawn into iron pipes. The bitumen was found to cable drawn into iron pipes. The bitumen was found to cable drawn into over the whole city were composed of bitumen that very high-pressure cables were in contemplation; they were referred to in Messars. 3,000-VOLT D.C. ELECTRIFICATION OF THE PUGET SOUND LINES OF THE CHICAGO, MILWAUKEE, AND ST. PAUL RAILWAY.

Plans for the electrification of the first engine division of the Chicago, Milwaukee and St. Paul Railway have now been completed and contracts let to the General Electric Co., of Schenectady, N.Y., for the electric locomotives, sub-station apparatus and line material, and to the Montana Power Co. for the construction of the transmission and trolley lines.

plans are being made to extend the electrification from Harlowton to the coast, a distance of 850 miles, should the operating results of the initial installation prove as satisfactory as

ing results of the initial installation prove as satisfactory as anticipated.

The plans of the Chicago, Milwaukee and St. Paul Railway are of especial interest, as this is the first attempt to install and operate electric locomotives on tracks extending over and operate electric locomotives on tracks extending over the full advantage of electrification can be secured. The various terminal and tunnel installations have been made various terminal and tunnel installations have been made electrification of this road is undertaken purely on economic electrification of this road is undertaken purely on economic grounds with the expectation that superior operating results grounds with the expectation that superior operating results grounds with the expectation on such a large scale will, at least, settle the engineering and economic questions that at least, settle the engineering and economic questions that will limit similar future problems to the means of raising the money expenditure required.

The first step taken towards electrification by the Chicago, Milwaukee and St. Paul Railway was to enter into a contract with the Montana Power Co. for an adequate supply of power with the Montana Power Co. for an adequate supply of power to the 440 miles of main line considered for immediate electrification. The precautions taken both by the railway company and power company to safeguard the continuity of power supply should guarantee a reliable source of power subject to the Montana Power Co. covers a great part of Montana and part of Idaho with its network of transmission lines, which are fed from a number of sources with a total power capacity developed and undeveloped by transmission lines, supported on sites are inter-connected by transmission lines, supported on sites are inter-connected by transmission lines, supported on sites are inter-connected by transmission lines, supported on the great facilities available and the low cost of construction under the favourable conditions existing the

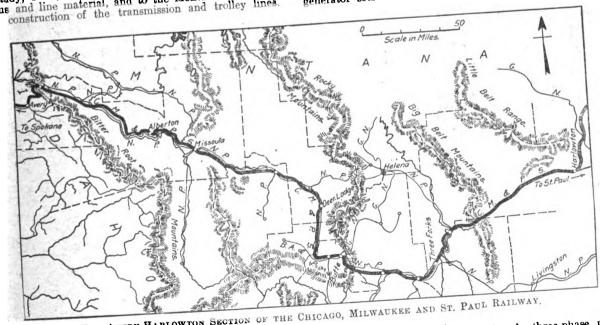

installations, and on steel towers and operating at 100,000 volts for later installations.

Due to the great facilities available and the low cost of construction under the favourable conditions existing, the failway company will purchase power at a contract rate of \$0.00536 per kw.-hour based on a 60 per cent. load factor. It is expected under these conditions that the cost of power for locomotives will be considerably less than is now expended for coal. The contract between the railway and power companies provides that the total electrification between Harlow-panies of the Montana Power transmission lines, a tie-in in points of the Montana Power transmission lines, a tie-in in points of the Montana Power transmission lines, a tie-in will permit feeding each sub-station from two directions and from two or more sources of power. This transmission type will be constructed with wooden poles and suspension type insulators, will operate at 100,000 volts and will follow, in general, the right of way of the railway company except where advantage can be taken of a shorter route over public domain districts.

The immediate electrification of 113 miles will include four

mountain districts.

The immediate electrification of 113 miles will include four sub-stations containing step-down transformers and motor-generator sets with necessary controlling switchboard apparameters.

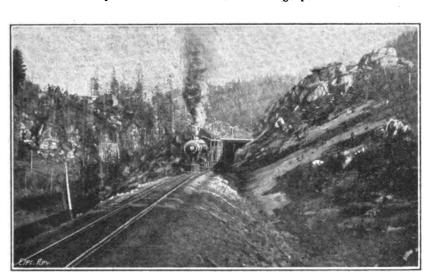

THE AVERY-HARLOWTON SECTION OF THE CHICAGO, MILWAUKEE AND ST. PAUL RAILWAY,

This initial electrification of 113 miles of main line between Three Forks and Deer Lodge is the first step toward the electrification of four engine divisions extending from Harlowton, Montana, to Avery, Idaho, a total distance of approxiton, Montana, to Avery, Idaho, a total distance of approximately 440 miles, aggregating about 650 miles of track, including yards and sidings. While this comprises the extent of ing yards and sidings. While this comprises the extent of track to be equipped in the near future, it is understood that

ratus to convert 100,000-volt 60-cycle three-phase power to 3,000 volts direct current. This is the first direct-current installation using such a high pressure as 3,000 volts, and this system was adopted in preference to all others after a careful system extending over two years. The 2,400 volt direct-investigation extending over two years. The 2,400 volt direct-current installation of the Butte, Anaconda and Pacific Rail-current installation of the Butte, Proposed Chicago way in the immediate territory of the proposed Chicago

Milwaukee and St. Paul electrification has furnished an excellent demonstration of high-voltage direct-current locomotive operation during the past year and a half, and the selection of direct-current at 3,000 volts for the Chicago, Milwaukee and

of direct-current at 3,000 volts for the Chicago, Milwaukee and St. Paul was due in a large measure to the entirely satisfactory performance of the Butte, Anaconda and Pacific installation. The equipment for this road was also furnished by the General Electric Co., of New York, and a comparison based on six months' steam and electric operation shows a total net saving of more than 20 per cent. on the investment or total cost of the electrification. These figures, of course, do not take into account the increased capacity of the lines, improvement to the service and the more regular working hours for the crews. The comparison also shows that the tonnage per

TYPICAL MOUNTAIN SECTION TO BE ELECTRIFIED

train has been increased by 35 per cent., while the number of trains has been decreased by 25 per cent. with a saving of 27 per cent. in the time required per trip.

The sub-station sites of the Chicago, Milwaukee and St. Paul electrified zone provide for an average intervening distance of approximately 35 miles, notwithstanding that the first installation embraces 20.8 miles of 2 per cent. grade west-bound and 10.4 miles of 1.66 per cent. grade eastbound over the main range of the Rocky Mountains. With this extreme distance between sub-stations and considering the heavy traffic and small amount of feeder copper to be installed, it becomes apparent that such a high potential as 3,000 volts direct current permits of a minimum investment in substation apparatus and considerable latitude as to location sites.

The sub-stations will be of the indoor type, the transformers being three-phase, oil cooled, and reducing from 100,000 volts primary to 2,300 volts secondary, at which potential the synchronous motors will operate. The transformers will be rated at 1,900 and 2,500 kva. and will be provided with four 2½ per cent. taps in the primary and 50 per cent. starting taps in the secondary.

The motor-generator sets will comprise a 60-cycle synchronous motor driving two 1,500 volt direct-current generators connected permanently in series for 3,000

1,500 volt direct-current generators connected permanently in series for 3,000 volts. The fields of both the synchronous volts. The fields of both the synchronous motor and direct-current generators will be separately excited by small generators direct connected to each end of the motor-generator shaft. The direct-current generators will be compound wound, will maintain constant potential up to 150 per cent. load, and will have a capacity for momentary overloads up to three times their normal rating. To insure good commutation on these overloads. times their normal rating. To insure good commutation on these overloads, the generators are equipped with commutating poles and compensating pole-face windings. The synchronous motors will also be utilised as synchronous condensers, and it is expected that the transmission line voltage can be so regulated thereby as to eliminate any effect of the fluctuating railway load.

The location and equipment of the several sub-stations is as follows:-

Station.		Miles from Deer Lodge.		Kw. per Unit.	Total.
Morel		17.1	2	2,000	4,000
Janey	•••	50.5	3	1,500	4,500
Piedmont		77.9	3	1,500	4,500
Eustis	• • •	120.6	2	2,000	4,000

The trolley construction will be of the catenary type, in which a 4/0 trolley wire is flexibly suspended from a steel catenary supported on wooden poles, the construction being bracket wherever track alignment will permit and cross-span on the sharper curves and in yards. Steel supports instead of wooden poles will be used in yards where the number of tracks to be spanned exceeds the possibilities of wooden pole construction. Poles for the first installation are already on the ground and thirty miles of poles are set. Work in this direction will be pushed with all speed and will be completed in the summer of 1915, ready for operation in the fall on the delivery of the first locomotives.

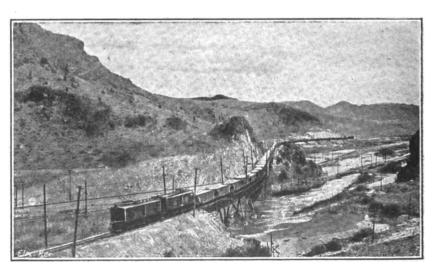

As the result of careful investigation and experiments, a novel construction of trolley will be installed, composed of the so-called twin-conductor trolley. This comprises two 4/0 wires suspended side by side from the same catenary by in-

comprises two 4/0 wires suspended side by side from the same catenary by independent hangers alternately connected to each trolley wire. This form of construction permits the collection of very heavy currents by reason of the twin contact of the pantograph with the two trolley wires, and also insures sparkless collection under the extremes of either heavy current at low speed or more moderate current at very high speeds. It seems that the twin-conductor type of construction is equally adapted to the heavy grades calling for the collection of very heavy currents, and on the more level portions of the profile where maximum speeds of 60 m.p.h. will be reached with the passenger trains having a total weight of over 1,000 tons. The advantage of this type of construction is due partly to the greater surface for the collection of current, but largely to the very great flexibility of the alternately suspended trolley wires, a form of construction which eliminates any tendency to flash at the hangers either at low or high speed. Including sidings, passing and yard tracks, the 113 miles of route mileage is increased to approximately 168 miles of single track to be equipped between Deer Lodge and Three Forks in the initial installation.

The locomotives to be manufactured by the General Electric by side from the same catenary by in-

installation.

The locomotives to be manufactured by the General Electric Co. are the first to be constructed for railroad service with direct-current motors designed for so high a potential as 3,000 volts. They will weigh approximately 260 tons and will have a continuous capacity greater than any steam or electric locomotive yet constructed. Perhaps the most interesting part of the equipment is the control, which is arranged to effect regenerative electric braking on down grades. This feature as yet has never been accomplished with direct-current motors on so large a scale. The general characteristics as proposed are tabulated below:—

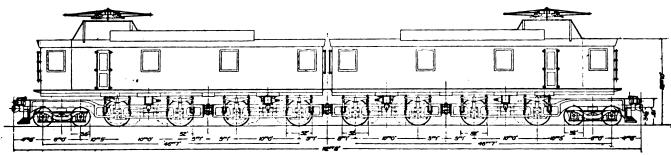

BUTTE-ANACONDA ELECTRIC FREIGHT TRAIN, CROSSING C., M. AND ST. P. TRACKS.

Weight on drivers 200 tons. Weight on each guiding truck 30 tons. Number of driving axles 8 Number of motors 8 Total length of locomotive 112 ft. Rigid wheel base 10 ft. Approximate speed at these loads and grades 16 m.p.h.					

The Chicago, Milwaukee and St. Paul Railway, from Harlowton to the coast, crosses four mountain ranges: the Belt Mountains at an elevation of 5,768 ft., the Rocky Mountains at an elevation of 6,350 ft., the Bitter Root Mountains at an elevation of 4,200 ft., and the Cascade Mountains at an elevation of 3,010 ft. The first electrification between Three Forks and Dear Lodge cells for lecomotive operation over 90 8 miles. and Deer Lodge calls for locomotive operation over 20.8 miles of 2 per cent. grade between Piedmont and Donald at the crest of the main Rocky Mountain Divide, so that the loco-motives will be fully tested out as to their capacity and general service performance in overcoming the natural the natural obstacles of the first engine division.

The initial contract calls for nine freight and three passenger locomotives having the above characteristics and similar in all respects, except that the passenger locomotives will be provided with a gear ratio permitting the operation of 800-ton

the operating cab of the leading locomotive. It is considered that electric braking will prove very valuable in this mountain railroading, for, in addition to providing the greatest safety in operation, it also returns a considerable amount of energy to the sub-stations and transmission system, which can be utilised by other trains demanding power. In this connection, the electric locomotives will have electric braking capacity sufficient to hold back the entire train on down grade, leaving the air brake equipment with which they are also equipped to be used only in emergency and when stopping the train. There is, therefore, provided a duplicate braking system on down grades, which should be reflected in the greatest safety of operation afforded and the elimination of a considerable part of break-downs, wheel and track wear and overheating with consequent reduction in maintenance and improvement with consequent reduction in maintenance and improvement in track conditions.

3,000-Volt Direct-Current Locomotive for the Chicago, Milwaukee and St. Paul Bailway.

trailing passenger trains at approximately 60 m.p.h., and will, furthermore, be equipped with an oil-fired steam heating outfit for the trailing cars. The interchangeability of all electrical and mechanical parts of the freight and passenger electric locomotives is considered to be of very great importance from the standpoint of operation and maintenance.

The cab consists of two similar sections extending practically the full length of the locomotive. Each section is approximately 52 ft. long and the cab roof is about 14 ft. above the rail exclusive of the housing for ventilation. The trolley bases are about 5 ft. above the roof, owing to the unusual height of the trolley wire, which will be located at a maximum elevation of 25 ft. above the rail. The outer end of each cab will contain a compartment for the engineer, while the remainder tion of 25 ft. above the rail. The outer end of each cab will contain a compartment for the engineer, while the remainder is occupied by the electric control equipment, train heater,

is occupied by the electric control equipment, train heater, air brake apparatus, etc.

The eight motors for the complete locomotive will be type GE—253—A. This motor has a normal one-hour rating of 430 H.P. with a continuous rating of 375 H.P. The eight motors will thus give the locomotive a one-hour rating of 3,440 H.P. and a continuous rating of 3,000 H.P., which makes it more powerful than any steam or electric locomotive ever built. The drawbar pull available for starting trains will approximate 120,000 lb. at 30 per cent. coefficient of adhesion.

Each motor will be twin-geared to its driving axle in the same manner as on the Butte, Anaconda and Pacific, the Detroit River Tunnel and the Baltimore and Ohio locomotives, a pinion being mounted on each end of the armature shaft.

a pinion being mounted on each end of the armature shaft. The motor is of the commutating pole type and has openings for forced ventilation from a motor-driven blower located in

the cab.

The freight locomotives are designed to haul a 2,500-ton trailing load on all gradients up to 1 per cent. at a speed of approximately 16 m.p.h., and this same train load unbroken will be carried over the 1.66 and 2 per cent. ruling grades on

With the completion of the remaining engine divisions, it is proposed to take advantage of the possibilities afforded by the introduction of the electric locomotive by combining the the introduction of the electric locomotive by combining the present four steam engine divisions into two locomotive divisions of approximately 220 miles length, changing crews, however, at the present division points. As the electric locomotive needs inspection only after a run of approximately 2,000 miles, requires no stops for taking on coal or water, or layover due to dumping ashes, cleaning boilers or petty roundhouse repairs, it is expected that the greater flexibility of the locomotive so provided will result in considerable change of the locomotive so provided will result in considerable change in the method of handling trains now limited by the restrictions of the steam engine.

In conclusion, we are indebted to the British Thomson-Houston Co., Ltd., whose allied concern in America is to carry out the contract, for the above particulars.

ELECTRIC STEEL-MAKING FURNACES.

By T. D. ROBERTSON.

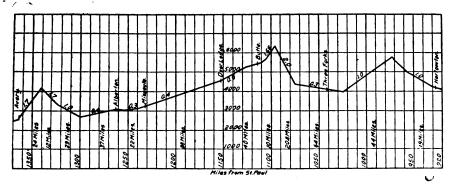

(Abstract of paper read before the Institution of Electrical Engineers, at Manchester, January 26th, 1915.)

THE first electric furnaces to work on a commercial scale were all constructed about 1899, and all took their power from water-driven plants. These were the Stassano furnaces in Italy, the Héroult in Savoy, and the Kjellin in Sweden; from these three types have developed the three main classes of electric steel furnaces now in use.

In the earlier types of induction furnace the metal bath is in the shape of a ring, which is really the short-circuited secondary winding of a transformer contained in the body of the furnace itself. An example of this class is the Kjellin furnace. The disadvantage of this type lies in the fact that some of the molten metal must be left in the furnace at the conclusion of every "heat" in order that a complete circuit may be maintained to start the furnace again. Cold materials a complete circuit may be maintained to start the furnace again. Cold materials to form the charge are added to this residual metal, and a covering of slag is made to protect the charge from atmospheric oxidisation. Owing to the difficulty of keeping a suitable refining slag in a fluid condition, and also of removing it after it has taken up impurities from the steel, it is found in practice that very little refining can be done in the simple induction furnace.

In the Röchling-Rodenhauser furnace both legs of the transpormer core are provided with primary windings surrounded

former core are provided with primary windings surrounded by induction channels, which are joined in the centre to form a working hearth of ample dimensions. Auxiliary heating is by induction channels, which are joined in the centre to form a working hearth of ample dimensions. Auxiliary heating is accomplished by means of a secondary winding connected to pole plates which are embedded in the sides of the hearth. Arc furnaces may be subdivided into radiation furnaces and conduction furnaces, the difference between them being that in the former the arc is struck between the ends of the elec-

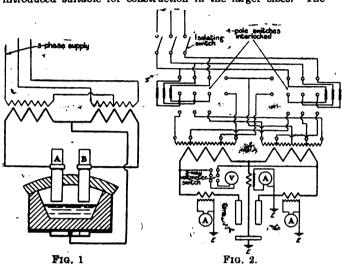

PROFILE OF THE AVERY-HARLOWTON SECTION, CHICAGO, MILWAUKEE AND ST. PAUL RAILWAY.

the west and east slopes of the Rocky Mountain Divide with the west and east slopes of the Rocky Mountain Divide with the help of a second similar freight locomotive acting as pusher. Track provision is being made at Donald, the summit of the grade, to enable the pusher locomotive to run around the train and be coupled to the head end to permit electric braking on the down grade. In this case, the entire train will be under compression and held back by the two loco-motives at this head end, the entire electric braking of the two locomotives being under the control of the motorman in trodes themselves and the heat so produced is radiated on to the charge underneath, whilst in the latter the arc is struck between the ends of one or more electrodes and the charge

The main furnace of the former class is the Stassano furnace. This was first developed in Italy, and is employed for steel melting in small sizes. Another furnace belonging to this class is the Rennerfelt furnace, in which three electrodes are used with two-phase current. Two horizontal electrodes, each used with two-phase current. Two horizontal electrodes, each carrying a separate phase, enter the ends of the furnace; a vertical electrode through the centre of the roof acts as a neutral return common to both phases. It is claimed that the arc in this case is deflected downwards on to the metal charge, which is thereby enabled to utilise the heat of the arc somewhat more efficiently than the Stassano furnace.

what more efficiently than the Stassano furnace.

Coming now to the second and more important class of arc furnace, the earliest of these furnaces was the Héroult furnace. The current enters by one of two upper electrodes, passes first through the arc gap, then along the surface of the metal, and back by means of the other electrode to the generator. It has the important drawback of requiring single-phase current. Latterly, a three-phase Héroult furnace has been introduced suitable for construction in the larger sizes. The

Héroult furnace has the disadvantage of surface heating. In other words, the upper layers of the charge are always much hotter than the lower, and this is undesirable when making high-quality steels requiring considerable quantities of ferroalloys, as these sink to the lower portions of the furnace, where they melt only with difficulty.

The Girod furnace is typical of the second class of arc conduction furnaces. There are one or more vertical electrodes according to the size of furnace and of like polarity. Embedded in the bottom and forming an integral part of the furnace are water-cooled steel studs, which project slightly above the bottom of the hearth and make contact with the charge itself, and so convey the current back to the generator.

Although this arrangement of steel studs in the furnace bottom is essential to the Girod system, it has its disadvantages, and in order to overcome these and at the same time obtain a furnace which will work from the usual supply mains through static transformers, the Electro-Metals furnace was designed a few years ago. The original inventors were the three Swedish engineers, Messrs. Grönwall, Lindblad, and Stälhane, who have designed and developed the Elektrometall shaft furnaces for the reduction of iron ores which have proved such a great success in Sweden. The development of their steel furnace has taken place mainly in this country where, after considerable time spent in experimenting, the furnace has now been thoroughly established for commercial working. Fig. 1 shows the main principles of the furnace. Two-phase low-pressure current is employed, and this is obtained from a three-phase system through two single-phase transformers using the well-known Scott connection. There are two upper electrodes each carrying a separate phase, whilst in the bottom of the furnace beneath the basic lining is a third electrode which acts as a neutral return common to both phases. Thus the current flows, on each phase, starting from the transformer, along the copper leads to one of

the bottom of the furnace where connections are made to the neutral return leads, which are common to both transformers. The electrical arrangement of the furnace is shown in fig. 2. The high-pressure supply, assumed in this case to be three-phase, is taken to an isolating switch inside the high-pressure cubicle, and from this it is divided into two circuits, each of which passes to a suitable oil switch, arranged with auxiliary contacts for charging resistances, to neutralise the effect of any sudden loads on switching in. It is found in practice that a fairly high pressure, say 80 volts, gives the best results during the melting stage, but that as much less power is required for the subsequent refining a lower pressure is desirable, as this

gives much less wear and tear on the furnace roof and sides, especially during the latter stages of the process. In order to have these two pressures at the ready command of the operator, the switches mentioned above are connected to tappings on the high-pressure side of the transformers, one tapping to give a high pressure of say 80 volts and the other to give about 50 volts. These two switches are interlocked so that only one of them can be put in at one time, and the change from the high to the low pressure is made simply by tripping one switch and then moving along the interlocking bar and putting in the other switch.

As is the case in all are furnaces, the current flowing in the furnace is controlled by raising and lowering the electrodes. In small furnaces this adjustment is made by hand, but in the larger ones where the moving portion of the electrode and holders, etc., weighs several hundred pounds a motor has to be used, in conjunction with some form of automatic regulator, preferably of the Thury type. In addition, a direct control is

be used, in conjunction with some form of automatic regulator, preferably of the Thury type. In addition, a direct control is effected by tramway-type controllers, which in conjunction with speed regulators enable the electrodes to be quickly hoisted out of, or lowered into, the furnace.

Some of the difficulties which designers have to meet in electric furnace work are only brought out clearly by a consideration of the actual work that has to be done in the furnace itself. Assuming that the previous charge has been "teemed" and the furnace fettled, the cold scrap is thrown into the furnace hearth. This scrap, preferably of steel or wrought iron, is usually of very common quality and contains up to 0.1 per cent. of both sulphur and phosphorus. When the furnace is charged the current is switched on and the electrodes are lowered until an arc is struck between them and the upper portion of the charge. The automatic regulators are then switched on and set to give the required current. In the case switched on and set to give the required current. In the case of a four-ton furnace, the melting current is about 5,500 amperes, at 75 volts on each phase. The heat of the arc soon melts a large hole in the charge underneath and round each electrode, which continues to travel down as these holes become deeper until a bath of fluid metal is formed in the bottom

melts a large hole in the charge underneath and round each electrode, which continues to travel down as these holes become deeper until a bath of fluid metal is formed in the bottom of the furnace. This bath increases in depth as other portions of the charge melt into it, and the electrodes gradually rise with the level of the metal. By the time they have risen to the usual working level of the bath any unmelted portions of the charge are detached from the sides and pushed within the hot metal in the centre. During the melting the slag is added-consisting of a mixture of lime, fluorspar, sand, and either iron ore or hammer scale. This slag floats on the molten metal and the chemical actions of refining take place. The carbon in the scrap is oxidised by the iron oxide in the slag, and is given off in the form of carbon monoxide, which rising through the metal gives the appearance of boiling.

This boiling serves to bring the slag and metal into more intimate contact. The silicon and manganese in the scrap are oxidised, and their respective oxides dissolve in the slag. The phosphorus is oxidised and, in the presence of the lime in the oxidising slag, is formed into a phosphate of lime, which enters into the slag. A portion of the sulphur is also oxidised and passes away as a gas. When sufficient time for these reactions to take place has elapsed, the current is switched off and the furnace tilted backwards until most of the slag has run off through a small spout at the back of the furnace into a slag bogie. The remaining portions of the slag are pulled off by means of rabbles until the surface of the metal is practically free from slag. In this way phosphorus is removed. The recarburising additions are made to give the required carbon to the steel and another purifying slag is added. This consists of lime, sand, and fluorspar, and quickly melts when the current at the same time is lowered to about 2,000 amperes. The phosphorus as stated above has been removed, but there remains among the injurious constituents in

The steel being now purified is adjusted to what is required by means of additions of allovs, the quantity of which is based on the result of a test analysis taken from the bath during the refining. A small addition of aluminium or an alloy of aluminium is usually added at the end in order to remove any trace of gases which may remain in the steel.

The ladle is brought under the tapping spout of the furnace. the small door above this is opened, and the furnace is tilted right over and its contents emptied into the ladle, from which it is teemed into the ingots or castings.

it is teemed into the ingots or castings.

When deciding on which type of furnace to install, the ques-

^{*}The Electro-Metals furnace was fully described in the Electrical Review of July 25th, 1913.—Eds.

tions of the initial cost of the plant, its suitability for running off existing power supplies, the cost of repairs to the furnace, and the case with which these can be carried out are as imand the ease with which these can be carried out are as important as the question of low power consumption. Much depends on the kind of raw materials used, upon the process employed, and upon the quality which is desired in the final product. Mild steel suitable for steel castings can be produced much more cheaply than the highest qualities of tool and alloy steels. When melting coid scrap, using two slags, and refining to a first-class quality, the approximate energy consumption decreases from 850 kw.-hours per ton, in the case of a two-ton furnace, to 700 kw.-hours per ton in the case of a five-ton furnace.

case of a two-ton furnace, to 700 kW.-hours per ton in the case of a five-ton furnace.

In addition to the melting of cold materials, electric furnaces are largely used for refining fluid metal taken from openhearth furnaces or Bessemer converters, this practice being more common in America and on the Continent than it is in this country. In America there is a big field open for the electric furnace in the manufacture of even such common material as steel rails. The specifications are continually becoming more severe, whilst the ores of the Lake Superior region are gradually becoming more impure; the steel made from them in the acid Bessemer vessels is gradually getting richer in phosphorus, so that a point has been reached when some purification will have to be made in order that the rails shall be capable of fulfilling the required tests. It is of interest to note that several thousand tons of electric steel rails have been in service on some of the main lines in America for some years and have up to the present given excellent results. The years and have up to the present given excellent results. The process of refining fluid metal is very similar to that employed in the ordinary way after the charge has become melted. A dephosphorising slag is added to the metal as soon as it is poured into the furnace, the finishing slag is added, and the process carried out in exactly the same way as that described escriber in this paper.

process carried out in exactly the same way as that described earlier in this paper.

The electric furnace is also finding a field as an auxiliary to the open-hearth and Bessemer processes, being used to melt ferro-manganese additions, as it has been found that the saving in the amount of this alloy required more than pays for the cost of melting it electrically.

In this country the field for the electric steel furnace is mainly in the manufacture of tool and alloy steels, for making the smaller sizes of steel castings, and possibly in connection with the open-hearth and Bessemer plants for producing a superior product. Abroad, however, especially in those regions where water power is plentiful and electrical energy can be produced very cheaply, it is possible, in fact probable, that electric furnaces will be used to produce steel in large quantities instead of employing the older class of fuel-fired furnaces.

DISCUSSION.

Mr. J. S. Peck said that the Electro-Metals furnace seemed to have a distinct advantage because it could be made for three-phase working down to comparatively small sizes, whereas the Héroult and other furnaces used three-phase for the large sizes only. Transformers of very special design were required for this work, on account of the number of low-tension coils in parallel to take the very high current. Tappings were also necessary from the high-tension winding in order to vary the voltage on the furnace. If these tappings were taken out in the ordinary way from part of the high-tension winding, there would be an unsymmetrical relation between primary and secondary, and very heavy local currents would probably occur. This difficulty could be overcome, and in general it was necessary to keep the positions of primary and secondary as symmetrical as possible. He asked a number of questions regarding the construction and use of electric furnaces.

Mr. K. M. FAYE-HANSEN considered the induction furnace the Mr. J. S. PECK said that the Electro-Metals furnace seemed

Mr. K. M. FAYE-HANSEN considered the induction furnace the best type from the engineer's point of view; it was possible to make a Kjellin three-phase and arrange it so as to secure a fairly reasonable power factor in reasonable sizes. The steel make a Kjellin three-phase and arrange it so as to secure a fairly reasonable power factor in reasonable sizes. The steel makers looked at the problem from other points of view, and most of the commercial electric steel furnaces were on the arc principle. Regarding arc furnaces, the first consideration was to get a fairly steady load and a reasonably good power factor. These requirements acted against one another. For instance, a power factor of .97 would be reasonable, using a transformer with leads having very little induction, but immediately a short circuit occurred very heavy currents would flow and cause trouble with the supply company. Small furnaces admitted of power factors of, say, 90 per cent. with short-circuit currents not exceeding double full load, but with large furnaces it was not possible to obtain high power factors on account of the high induction effects. The manufacturer therefore arrived at certain limits of size dependent upon the voltage permissible at the arc.

voltage permissible at the arc.

Mr. D. S. PAXTON remarked that the author had recommended the Thury regulator; in his experience some of the other types were quicker in action in the case of large current

Mr. Eustaca Thomas spoke of the difficulty of obtaining steel Mr. EUSTACE THOMAS spoke of the difficulty of obtaining steel of a particular quality in this country, whilst on the Continent higher grades were produced. One predominant feature, even with English firms of the highest repute, was their inability to reproduce the same steel at different times. A sample, not specially selected, but giving excellent results, might be obtained from the makers, but when the bulk was supplied, it might be totally different. Chemical and microscopical examinations seemed unable to reveal any difference, and it might be said that electrical tests had apparently proved far more searching than any chemical or physical tests which could be applied. Small quantities of impurities such as arsenic or sulphur, which subsequent chemical analysis would scarcely account for, might make an enormous difference. It would appear possible with the electric furnace to make steel with much greater accuracy than with the ordinary furnace.

Mr. Wilkinson said that he was interested in a supply station in India which included an engineering works and foundry. Many hundred tons of scrap iron were lying useless, and it was considered possible to convert this by means of an electric furnace during the winter nights, when the load was comparatively small. An electric furnace might, in this case, be an ideal adjunct, and profitable to both departments.

Mr. G. L. Rosser asked whether only basic steel was manufactured in the electric furnace, and, if so, whether it was superior to that produced by the Siemens open-hearth acid process.

process.

Mr. J. A. Panton wrote to say that some nine months ago he visited, at Sherbrooke, Canada, a works where electric furnaces were entirely used for smelting ordinary steel and manganese steel castings, including electrically smelted bronze bearings and ferro-manganese brake blocks, all for railway and tramway use. The type of plant in use was similar to the Héroult described by the author, but of the three-phase type, wherein the three vertical carbons were raised or lowered by hand gear into the square steel case, which was lined with special bricks, dipped in tar, and was mounted on curved rails for tilting purposes; the tilting was effected by hand power, and water cooling was provided round the electrode holes. The electrodes were 7 in. in diameter and about 3 ft. long, screwed and water cooling was provided round the electrode holes. The electrodes were 7 in. in diameter and about 3 ft. long, screwed male and female for continuous feeding. This represented a two-ton furnace, which invariably received a charge of 35-30 cwt. of metal. The power was supplied by a waterfall seven miles distant, arriving at the works at 6,600 volts, which was transformed down to 110 volts. The time taken for a cold charge was five hours, but as the plant invariably worked night and day the remaining heats took four to four and a quarter hours. The starting current represented 264 kw., or 2,400 amperes melting current on the low side, so that for a four hours' charge the consumption was about 900 kw.-hours for 30 cwt. of metal in the ladle; the cost per unit was 0.2 of a cent, contracting for large blocks of power annually. The chief difference between the castings made by the new and cld processes was that owing to the low carbon in electric castings, many were used without annealing. He agreed with the author that a very fine field existed for electric steel rails, especially of the manganese or ferro-manganese type. Caution especially of the manganese or ferro-manganese type. Caution should be exercised not to reduce the conductivity of rails should be exercised not to reduce the conductivity of rails used for electric railway and tramway purposes, and with regard to tramways where magnetic slipper brakes were in use, manganese steel made by the electric process was practically non-magnetic, more so than manganese steel made by the ordinary process.

The AUTHOR, in reply, said that makers in the early days of electric furnaces had experienced a lot of trouble at the works of their customers, who expected immediate commercial results. This led to a deal of prejudice against the electric furnace; but now, fortunately, the prejudice was being overcome and furnaces were working steadily and continuously on sound lines. Fifteen-ton furnaces had been used in America,

rurnace; but now, fortunately, the prejudice was being overcome and furnaces were working steadily and continuously on sound lines. Fifteen-ton furnaces had been used in America, chiefly for refining metal for steel rails. Tests were now in progress with rails produced in this way, and there was every indication that the results would be very satisfactory. A big development was to be expected in the United States in the use of large electric furnaces for refining crude Bessemer steel. The largest electric furnace known to the author was a Girod furnace of 20-ton capacity installed in France prior to the war. The subject of ore reduction by electricity was treated in reports published at various times in Sweden, which possessed favourable conditions in the form of reasonably cheap power and suitable ore. At the present time Sweden had electric furnaces either working or being installed with a total capacity of 40,000 H.P. The price at which electricity would permit economical working depended upon the quality of the product required. Generally speaking, with energy at \$\frac{1}{2}\$d. or .6d. per Kw.-hour the electric furnace would compete in the small steel casting industry. It would certainly do so for high-grade tool steels. The heat in the induction furnace was generated within the metal comprising the ring round the transformer, consequently the slag which rested on the top of the metal received its heat from the latter. This condition, together with exposure to the atmosphere, caused the slag to be cooler than the metal during the whole process and for of the metal received its heat from the latter. This condition, together with exposure to the atmosphere, caused the slag to be cooler than the metal during the whole process, and for this reason certain slags which would otherwise be suitable could not be employed. In the arc furnace the conditions were reversed, as the arc played on the slag, which in turn delivered heat to the metal. This condition ensured proper chemical reaction in steel refining. The power factor in large induction furnaces was very bad and specially low frequencies had to be employed. A two-phase furnace would not be likely to suffer from shorts on both phases at once, so that the total disturbance was reduced. The short circuits occurred during melting, when the metal became soft and fell against the electrode, and the usual proxidure was to raise the electrode out of the way when this occurred. It was necessary to have the current passing through the bottom of the two-phase Electro-Metals furnace during the whole period. This

manifested itself in the refining stages, as in the later stages manifested itself in the refining stages, as in the later stages the circulation of the metal avoided inequalities in temperature of the metal. A modification of the two-phase furnace was to be introduced whereby the amount of current flowing in the bottom of the furnace would be under control. The Continental steel referred to by Mr. Thomas was probably electric steel, and very regular and uniform in quality. In the author's opinion the trouble with crucible steel was the fact that the crucibles themselves contained a small quantity of steel and no two excelves would small out exactly alike fact that the crucibles themselves contained a small quantity of steel, and no two crucibles would smelt out exactly alike. In consequence, there was much more danger of variation than in the case of the electric furnace, where the sole charge was of uniform quality. The chief advantage of electric steel was that the injurious oxide of iron which was present in all molten steel could be effectively removed, owing to the reducing conditions in electric arc furnaces. In reply to Mr. Wilkinson, with a two-ton furnace the total time between teeming one heat and teeming the second heat would be about six hours. The melting period would be about three hours, during which time the full capacity, say 400 km, would be taken. The second or refining period would probably take only 200 km, and would last about two hours. Taking the case of a furnace working continuously, that is to say, 24 hours per day and five days per week, so as to allow for repairs, twenty charges per week of 45 or 50 working weeks per annum would be usual. The power factor depended upon the arrangement of leads, but in the case mentioned it would be about .9. One hour in the six referred to would be allowed for charging, removing slag, etc. The time table quoted would not apply to special tungsten steel, but for refining any scrap and making carbon steel with low sulphur and phosphorous, say .08-1 per capt. of steel, and no two crucibles would smelt out exactly alike. to special tungsten steel, but for refining any scrap and making carbon steel with low sulphur and phosphorous, say .08-.1 per cent. sulphur and phosphorus in the raw material down to .02 per cent. sulphur and the same phosphorus in the finished product. With one or two exceptions all electric steel was made on a basic bottom. Dephosphorising could not be carried out on an acid bottom. The low carbon in electric steel castings was very important, as it admitted of such castings being subsequently machined without annealing. In the case of crucible steel castings, the carbon could not be brought so low, and consequently they were hard and required annealing before machining. before machining.

MORE ABOUT CO-OPERATION.

WE print on another page to-day some interesting comments that were made last month by one of the leading electro-industrial authorities in America, which bring home to our minds more forcibly than any other observations that we have yet read, the extent of the depression in some trans-Atlantic industries. Mr. Trip shows that while the foreign works associated with his particular organisation—that is, the factories in England, France, Italy and even in Austria—are very busily engaged, partly, it is true, with war orders, those in the States, far removed from the war zone, are only operating at between 50 and 60 per cent. of their normal output. He also does not conceal the belief that if (we say when) the Allies win, England will derive greater permanent commercial benefit from the war than the United States will do. While all the world save perhaps the lie-deceived people of enemy countries, knows well enough that England did not, nor never would have done, enter upon this colossal conflict for the mere sake of economic interests, it would be absurd for us to affect to believe that the future course of inter-Colonial and international trade will not be very materially influenced by what has been happening. The Colonial and Allied sentiment is undoubtedly strongly in favour of England at the moment, and the future interests of all these parties will be to a very large extent bound up together, so that that favourable sentiment will, failing unforeseen and improbable mishaps, become increasingly strengthened. We firmly believe that the overwhelming majority of opinion in the United States is faithful to the cause of general freedom and to the suppression of the monster of militarism, and if coming events do not contribute any serious reason for removing that belief from the minds of the nations that are now trying to free both hemispheres from the menace, the United States as an industrial people should also stand to gain. But, of course, it must not be suggested that that should be advanced as an inducement to Brother Jonathan to drop his attitude of neutrality.

It is clearer than ever from Mr. Trip's remarks that American depression is far from being entirely due to the war; our cousins' troubles were already well begun months before the outbreak, and the trade position had become very unfavourable. Under such circumstances, it is but natural that the disorganisation of world affairs due to Prussian and Austrian ambitions, should have brought serious effects upon a people already industrially under a cloud.

What the States seems to need for the assistance of its industries is a revival of confidence, and to engender that confidence Mr. Trip lays emphasis upon the usefulness of "co-operation." Let us co-operate, he says, by joining hands to "bring about a better business state of mind"; let everybody make a cautious start, taking a little risk, and a general movement will result which will be surprising. One of the directions in which he advises Americans

to assist such a movement is by taking advantage of these "dull times" to "overhaul your roadbed, plant and machinery, and make small additions against future growth." Roadbed was mentioned because the speaker was addressing the members of a Street Railway Club, but the proposal in principle is similar to that advanced by Mr. T. Roles in his I.E.E. Sectional Address. latter gentleman referred to the possibility of municipal electricity works and manufacturers adopting a measure of co-operation in the ordering of certain requirements. We discussed the matter favourably in an editorial entitled "Co-operation," in the ELECTRICAL REVIEW for November 20th, 1914, and we referred in the same article to certain proposals for co-operative electrical dealing which came to an ignominious end some years ago. Of course when one refers to the events that happened years ago and proved failures, one does not expect it to be necessary to say why they had "no burial." Having thus referred to the ignominious end of one particular scheme, we, as editors, could only be amused when a writer, who apparently knew but little about the matter, allowed himself to flounder so helplessly by describing us as having "attended the funeral" of the "great principle" of co-operation.

Those who have closely followed their ELECTRICAL REVIEW in its discussion of trade and industrial affairs, do not need to be reminded that we have consistently advocated co-operative measures for alleviating the troubles and assisting the expansion of the electrical industry, and we have consistently supported worthy efforts on the part of our manufacturers in such directions. We were regular attendants at the gatherings of the old National Electrical Manufacturers' Association, and our pages in those early days show how earnestly we worked and wrote in its interests; more than once it thanked us for our assistance. That Association, whatever defects it had, and it certainly had some, formed the nucleus of the other organisation which, we are now pleased to learn from the first number of its Journal, is actively engaged upon a programme of co-operative aggression in the Colonial and foreign markets, the like of which has never been adopted by the British electrical industry in the past. Has it not inaugurated "everyone of the suggestions" contained in our editorial of November 20th, 1914? Let the reader who wants to know whether the British electrical manufacturers are doing anything, and what, along co-operative lines, refer to our aforesaid article, tabulate the suggestions therein contained, and, leaving the ranks of the critics and the grumblers, let him forever hold his peace.

Independent of the assurance that is thus conveyedthough it may be that we are wrong in assuming that our suzgestions have been adopted, as the paper referred to is not named, but is merely described as "one of our contemand some editorial other than our own may be referred to-we are very pleased to know that groups of B itish electrical manufacturers are deeply engaged upon cooperative schemes for enterprisingly dealing with the requirements of some of the great markets that are expected to offer such brilliant opportunities. We confidently anti-cipate that the most gratifying results will sooner or later, perhaps immediately, reward the efforts of those who have had the courage and patience to develop schemes and are prepared to make the necessary initial sacrifice. It is many years ago now, when manufacturers were only just beginning to "get together," that we published appeals from China, Australia, and from Canada, from expert contributors of our own who had travelled the world over in the interests of trade, and from Governmental trade representatives whom we interviewed when home fresh from their Colonial investigations, urging British electrical and engineering firms to come together in groups, and by dint of the strong organisation and backing thus obtained, secure for us a more reasonable command of excellent markets. It is with pardonable pride that we see that our suggestions, which were sometimes received with contumely, but nevertheless were consistently supported by means of editorials and by contributions of expert students of world trade, are, in this year of grace 1915, being adopted at any rate by some of our firms.

Though we have never attended the "burial" of the principle of co-operation, we have recorded the liquidation of some projects inaugurated with that great word upon their banners, and it has been our painful duty to observe what has happened when the reader of, or the advertiser in, an electrical publication has been afforded an opportunity of being a shareholder in the same. Publications in which the advertisers are the shareholders cannot hope to possess the smallest shred of independence, though they may have special functions to fill in which that important quality does not count. While we advocate co-operation, we recognise that it has its limitations; only last year we witnessed the inability of avowed apostles of the principle of co-operation to co-operate among themselves.

The reader will observe that "that blessed word" cooperation has led us a long, long way from where we meant to go when we started to write this article. Mr. Trip urges Americans to co-operate and revive home industries by an effort to engender widespread confidence-ordering requirements ahead so as to fill the blank spaces in their works. We continue to urge manufacturers, whether organised or not, to do their utmost to ensure a splendid position for British electrical and engineering industries in the future, by adopting and pursuing unceasingly measures which will gain for us a firm hold upon Colonial, European and other foreign markets—individually, if they are strong enough, as some undoubtedly are, but co-operatively, in groups, if they cannot tackle the business alone. We believe that they will be able to rely upon the co-operation of the British people for a time as regards the home market, especially if there be some modification of Government policy so as to favour the purchase of British products with British public money. Even if that, when granted, only continues for a time, it will materially assist until the benefits of campaigns abroad bring a large and continuous volume of new business from Colonial and European markets.

A Blank
Specification.

To record a protest against methods of procedure which impose unjust burdens upon firms tendering for contracts is no new policy with us; but in the past we have usually taken up the cudgels on behalf of manufacturers of electrical machinery, whereas the case to which we now wish to direct attention concerns installation contractors only.

The matter arises in connection with the electric lighting of a new sanatorium at Thingwall, for the Corporation of Birkenhead, under the superintendence of the borough engineer and surveyor (a M.Inst.C.E.); from original documents we gather that the engineer invited a number of contracting firms to tender for the work, by means of a circular letter which stated that plans might be seen, and specifications, bills of quantities, and form of tender obtained at his office, on payment of a deposit, to be returned on receipt of a bonâ fide tender. Fourteen days from the date of the circular were allowed for the lodging of sealed tenders—including eleven working days.

There was nothing extraordinary in this; but the so-called specification, when obtained, was found to consist mainly of general conditions, and a list of the rooms to be lighted, with their dimensions. A key plan to the district, and a plan of the laundry block, accompanied the "specification," but no other drawings were provided. The main buildings comprised 38 rooms, including two wards, and there were, in addition, 12 rooms in other buildings, two large shelters, and the grounds to be lighted. From the meagre data supplied, it would be impossible to prepare even an approximate estimate of the cost of the installation; no scheme was obtainable, and the borough engineer, we are informed, stated that he was asking a number of firms to draw up schemes, with the intention of selecting one of these and then asking the firms to tender. In other words, he invited these firms to act as

honorary consulting engineers, and did not even promise to place the order with the winner in the preliminary com-

petition or to remunerate him in any way.

The whole procedure was objectionable on various grounds. In the first place, the engineer, if he felt himself unqualified to draw up a proper scheme and specification, ought to have called in the aid of a competent consulting electrical engineer to do so; such a proceeding would have been in no way undignified, he being a civil not an electrical engineer, and it would have safeguarded the public interests against waste and inefficiency. Secondly, a deposit ought not to have been demanded, seeing that a bonâ-fide tender obviously could not be submitted, and indeed was apparently not desired. While the practice of placing the whole matter in the hands of a selected contracting firm of high standing might have been adopted in the case of a private contract, it is not permissible in the case of a municipal contract, which must be put up to public tender; but such tendering should be based upon uniform requirements, which cannot be the case when no definite scheme is placed before the And lastly, to require a number of firms to tenderers. incur the expense and loss of time involved in preparing separate schemes is not only an undesirable proceeding at any time, but is unpatriotic when we are at war and when the services of every engineer should be utilised in the most efficient way.

The proper course in such a case is for every contractor

to decline to tender under such conditions.

THERE has not been any change of The Rubber importance in the prices ruling from day to day for crude rubber, but the tendency

of the market appears to have been quietly towards improvement. The home trade demand has continued good, which is quite in keeping with the well sustained activity shown in pretty well all branches of the manufacturing trades, the state of things in the various tire plants all over the country being absolutely unprecedented. The immense orders given out for life-saving equipment for distribution to all those employed in the Fleet, has put manufacturers in a difficult position on account of the terrible pressure which exists for deliveries, and this at a time when all other departments of works are running night and day on State orders. regards export business, the American demand has not been quite so active as it was recently, which is only natural, for quite heavy quantities were dispatched some time ago to Moreover, it is understood that certain big New York. consumers at Akron, in Ohio, have taken very large A good deal of this rubber was, during the embargo, diverted to Toronto, where it was temporarily held up, but big consignments have also been shipped from Liverpool by mail steamer, so urgent was the need for raw material at the American plants. The difficulties of obtaining supplies of finished goods for the troops would have been rendered exceedingly acute had not the embargo been relieved by the resumption of exports of rubber from here to the United States. As it was, the price of crude rubber in America practically doubled during the duration of the embargo, but now things are assuming a more normal The following guarantee has to be signed appearance. by American firms importing rubber from the United Kingdom:

We will not export from the United States any raw rubber, reclaimed rubber, or waste rubber, whether the same has been imported from the British Dominions or not, otherwise than to the United Kingdom or to a British Dominion.

We will not sell the rubber now delivered by you to any dealer or other person or persons in the United States, but will use it for

our own manufacturing purposes.
All orders received by us for manufactured or partly-manufactured rubber goods to be sent to neutral European countries shall be executed from stocks maintained by us in the United Kingdom or be executed by shipments to the United Kingdom, and reshipped from there under licence to be obtained for export therefrom.

We will not execute any orders for manufactured or partly-manufactured rubber goods to be sent either directly or indirectly to any country or State at war with Great Britain.

We will not sell any manufactured or partly-manufactured we will not sell any manufactured or partly-manufactured rubber goods to any p rson in the United States without satisfying ourselves that there is no intention on his part to export or resell the same for exportation to any countries in Europe other than Great Britain France, or Russia, otherwise than by shipping to the United Kingdom and reshipping from there, under licence to be obtained for export therefrom.

It we export any manufactured or partly-manufactured rubber goods to a destination outside Europe, not being in a British possession, we will prior to or simultaneously with this shipment, give particulars of the goods so shipped and their destination.

All rubber tires exported by us or sold by us for export shall bear a distinctive name or mark which we will communicate to you, so

as to identify them as being our manufacture.

The strenuous efforts made by Germany to obtain rubber are shown by the detection on the steamer Cretic, loading in the United States for German ports, of bales of cottonwaste each containing 4 lb. of rubber. The fraud was discovered by the X-ray examination always now conducted in connection with the loading of vessels for Germany at American ports.

According to official information issued, the export of rubber from the Federated Malay States during January was 3,473 tons compared with 2,512 tons in January, 1914, and 3,361 tons in December last. The returns for January constitute an absolute record, and testify alike to the progress of production there and to the clean sweeping of the

seas by the British Navy.

It is a matter of common know-Delay 8 ledge that certain of our electrical in Delivery. manufacturing firms have been called upon by the Government to carry out urgent orders in connection with the operations of the naval and military authorities; in some cases almost the whole output of the works has been devoted to this pre-eminently important service since the commencement of the war, greatly to the detriment of the ordinary business of the firms concerned. The prices paid by Government for such work have not been gilt-edged, and it would be a mistake to suppose that the manufacturers were greedily taking advantage of the nation's need. Moreover, large numbers of skilled workmen have been called up to the Colours or bave enlisted, with the result that workshop organisation has been seriously embarrassed, though the authorities, recognising this fact after a time, declared that such men would serve their country no less effectively by continuing their ordinary avocations. The manufacturers under these difficult conditions have uttered no complaint, but have patriotically endeavoured first to satisfy the military requirements at all costs, and afterwards to do what they can to supp'y the needs of their regular customers.

The latter, unfortunately, have not always evinced a disposition to exercise pat ence and to make due allowance for the u gency of Government orders. The difficulty of their situation commands our sympathy, but some of them-like so many others of our fe low-countrymen-apparently fail utterly to realise that this nation is now engaged in the most violent struggle recorded in history—a fight for its very existence as a nation. The idea still seems to prevail in some quarters that there is "a sort of war" in progressbut that it is on the Continent and need not trouble us There could hardly be a greater or more dar gerous much. error. The war is going on right here - in our workshops and on their efficiency and productiveness the issue of our

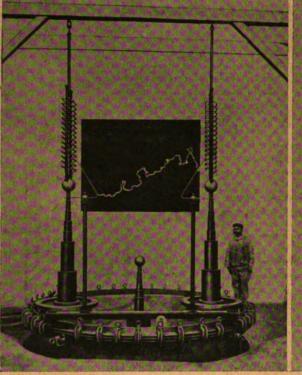

Millions of men and millions of money are powerless to gain the victory unless our forces are provided with equipment and munitions of war of the highest quality, in ample quantity, and at the earliest possible moment. We therefore appeal to those would be purchasers, who are tired of the constant reiteration of the plea that delays in delivery are due to urgent Government demands, to accept that plea without demur, and to subordinate their own requirements to the imperious necessities of the nation. The plea is genuine-let them not think it a mere excuse; and those who worry the hard-pressed manufacturers in question with their complaints are guilty of a grave disservice to their country.

A HIGH-PRESSURE TRANSFORMER.

For testing cables, porcelain insulators, &c., very high pressures are required, and a number of transformers for this work have been built by the Oerlikon Co. giving pressures of 200,000 to 250,000 volts. The constant rise in working pressures, however, which now run upwards

The pressure is gauged by means of a spark-gap, which is seen in operation in fig. 2; this is preferred to the use of a voltmeter on the primary. Discharge between points takes place across a maximum distance of 244 mm. at 100,000 R.M.S. volts; 514 mm. at 200,000 volts; 774 mm. a: 300,000 voits; 1,050 mm. at 400,000 volts; 1,320 mm. at 500,000 volts; 1,580 mm. at 600,000 volts, and 1,850 mm. at 700,000 volts. The electrodes are

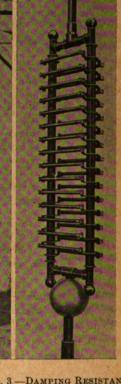

FIG. 1.—OEBLIKON HIGH-PRESSURE TRANSFORMER,

FIG. 2.—TRANSFORMER IN USE.

FIG. 3 - DAMPING RESISTANCE.

of 100,000 volts in Central Europe for long transmi-sions, has necessitated still higher test pressures, and we illustrate herewith a transformer which the company has recently constructed for its own test room, giving secondary pressures of 250,000 and 500,000 volts.

The continuous rated load is £00 KVA. at 500 volts on

the primary. The oil tank is 3.6 m. high × 3.3 m. in diameter ; the height over the terminals is 5 75 m., and over the suspension frame 89 m. The weight of the active part is 10 tons, and of the tank over 5 tons; the latter holds 19 tons of oil, the total weight of the transformer being about 34 tons.

Fig. 1 gives some idea of the dimensions of the apparaminal represents the mid-point of the secondary winding, which is normally earthed, but for

special tests (up to 200,000 volts) can be in ulated. One pole of the primary is always earthed. The maximum pressure attainable is 600,000 volts, and the output can be raised to 2,000 KVA. momentarily.

FIG. 4.- INDUCTION REGULATOR.

mounted on a graduated scale, bolted to the top of the

The discharging poles are not connected to the main terminals directly, but through a carbon resistance, which is kept always in circuit to damp out the dangerous oscillations of pressure which occur when the spark jumps across

the gap. The resistances, which are ances, shown separately in fig. 3, are bolted to the terminal spheres and are suspended with them by insulating tubes from an iron frame. The voltage is controlled by an induction regulator, fig. 4, in the primary circuit, giving a continuous variation in the circuit secondary from 0 to 500,000 volts.

When testing cables or insulators of large capacity, the capacity current can be completely balanced by connecting a variable inductance, fig. 5, across the terminals

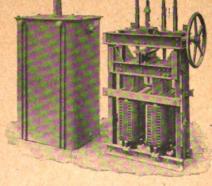

FIG F,-VARIABLE INDUCTANCE.

of the transformer primary, and adjusting it so that the cu rent flowing is only sufficient to make good the loss. When this is dine, the regulator need only be large enough to provide for the losses in the transformer.

THE ELECTRICAL TRADE OF SIAM.

By "L, A. DE M."

BRITISH electrical firms have for many years neglected the possibilities as regards trade in Siam, indeed most, or at least many, firms are so wanting in knowledge as to send out catalogues addressed Bangkok, India—this actually occurs month after month. Hence the writer ventures to

give a few notes on the trade conditions of Siam.

The capital of Siam is Bangkok, which is situated immediately alongside the River Menam, large steamers being able to get right up the river, even as far as the Samsen end of the city [population of Bangkok about 635,000], while river boats can reach a point inland some

120 miles from the river mouth.

Much useful information may be obtained from Mr. W. A. Graham's book on Siam, published by Alex. Moring, Ltd., London, and from the Bangkok and Siam Directory, published by the Bangkok Times Press, Ltd., at a price of 10 ticals per year, which is obtainable from Messrs. Algar, 11, Clement's Lane, London.

Shipment of Goods.—The East Asiatic Co. run a direct line of large steamers from Antwerp and Middlesbrough to Bangkok, where they can discharge alongside the company's wharf. The journey takes about seven weeks. The P. and O. Steamship Co. also ship to Bangkok, but goods have to be transhipped at Singapore, from which port there are steamers running weekly to Bangkok.

Banking Houses.—The principal banking houses are:—

Hong-kong and Shanghai Bank.

Chartered Bank of India, Australia and China.

Banque de l'Indo-Chine.

Mercantile Bank of India, Ltd.

Electrical Power Stations.—There are two electricity supply stations in Bangkok, viz.:—The works of the Siam Electricity Co. The Government power station, Samsen. A third—a tramway station—put down some few years ago proved to be a financial failure, and has been practically dismantled.

The Siam Electricity Co.—This station is a very old one, and until quite recently supplied single-phase current at 2,000 volts, 100 cycles, transformed down to 100 volts.

The company has recently changed over to three-phase, 50 cycles, and adopted a station voltage of 3,500 volts, the old single-phase supply at 100 cycles being almost entirely done away with. Two 1,000-kw. turbo-alternators recently installed supply the three-phase power, the tramway being fed from a motor-generator, and alternatively from a steam Manager, Mr. engine-driven direct-current machine. W. L. Grut; chief engineer, Mr. H. Hansen.

The Government Samsen Power Station.—In 1911 the Siamese Government invited tenders for the construction of a large power station at Samsen, Bangkok, the contract being secured by the A.E.G., the B.T.H., and the G.E. Co. of

America, who put forward a joint tender.

The station was started up in December, 1912, but the contractors have to run the plant until the end of March. 1915, on behalf of the Government, under the control of the contractor's chief engineer, Mr. Noël E. Dufty.

Although the A.E.G., of Berlin, were the chief contrac-

tors, the whole of their staff are English.

This station is very well equipped with most modern plant, even down to CO, recorder and Lea water recorder. boiler house is fitted with eight Babcock & Wilcox land type water-tube boilers fired with rice husk (also known as paddy husk) and, alternatively, oil fuel. The power house plant comprises three A.E.G. turbo-alternators of 1,335 K.V.A., 3,500-volt, 50-cycle, 3,000 R.P.M., and a motor-generator having an output of approximately 375 kw., together with a Tudor storage battery.*

The station voltage is 3,500 to 3,850 volts, the distri-

bution lines being kept at 3,500 volts.

The distribution area is very extensive, there being over 120 km. of high-tension distribution line in operation.

So far the load on this station is far below that anticipated, being under 300 kw., and the management are trying very hard to increase the load by introducing motor

driving to the local rice mills and saw mills. In this direction there should be a field for British firms, as some of the saw mills have already taken up electric driving. At the moment, the chief load on the station is the waterworks, where all pumping is done electrically.

The low-tension distribution is at 110 volts, except the street lighting, where the more modern practice of 220 volts has been adopted. Current is supplied for lighting at 40 satangs per unit, and at half rate, i.e., 20 satangs, for power purposes. [Note.—One pound sterling is approximately ticals 13, satangs 11, and one tical equals 100 satangs.]

Hence it will be noted that the cost of current is very

low, especially for a country where coal is dear.

The following notes should be carefully borne in mind in connection with Siamese trade.

Language.—Very few Europeans have more than a slight knowledge of Siamese, whereas nearly every educated Siamese speaks English more or less fluently, so that for the most part English catalogues can be safely sent out.

Weights and Measures.—By a Decree issued in 1912, the King of Siam introduced the metric system into Siam, and the older weights and measures are now almost defunct. The old unit of weight, the picul or haph (equal to $133\frac{1}{3}$ lb. avoirdupois), is still used by the old rice mill men, and some of the older cubic measures are retained to some extent in the teak wood trade.

Siamese Coinage.—The 1908 Gold Law introduced the

new metric coinage, as follows:-

- Doe, or 10 tical piece. Gold.

Silver. — 1 Tical.

2 Salung piece and

1 Salung piece.

Nickel. — 10 Satang piece.

5 Satang piece.

Bronze.— 1 Satang piece.

Climate.—In connection with the rating of motors, &c., it must be borne in mind that the climate is tropical; during the hot and the rainy seasons (March to October) the temperature variation is from 108° F. to 79° F. In the cold season, from the end of October till February, the maximum temperature is between 94° and 106° F., while the minimum temperature may reach 55° F. The climate is also very humid, and leather work, &c., is liable to suffer badly from mildew, while steel and iron work rusts very badly. Electric meters are very liable to become useless owing to rusting of the magnet-pole faces, unless such iron parts are well protected. Nickel plating does not stand well, and the only really satisfactory way to prevent rusting appears to be the "Coslettising' Hygroscopic insulation materials such as fibre should be carefully avoided.

Fauna, Insects, &c.—In common with all tropical countries, insects are liable to cause considerable trouble, the writer having come across one instance where mud ants caused an entire failure of a small telephone installation, while in a second instance a batch of arc lamps gave trouble owing to flies clogging up the regulating magnets.

White ants attack all European woods, and therefore only teak wood should be used for instrument cases, &c., especially where such woodwork is a fixture. Cases are by no means unknown where white ants have attacked the woodwork of even motor-cars that were not in constant use, while cable drums are often completely ruined before the cable has been laid; hence such drums and all packing cases that may have to be stored for a time should be treated with white ant-resisting compound. The local firms usually place all packing cases on a floor or bed of paddy husk, which to a great extent prevents white ants reaching the woodwork.

Lead-covered cable, especially telephone cable, has proved quite a failure in Siam due to the existence of a small insect that bores holes through the lead covering. This insect has caused a great deal of trouble with the overhead lead-covered telephone cables in Bangkok and elsewhere, and has also been responsible for the complete failure of a lighting system using lead-covered cable, although such system is well known and quite reliable in This trouble is not by any means confined to Siam, being experienced in China and other parts of the East. So far as can be ascertained, lead-covered cable laid in

^{*} This station was fully described in the ELECTRICAL REVIEW of the 6th, 13th and 20th November, 1914.—Eds.

the ground is protected from attack provided the cable is steel tape armoured, or alternatively laid in bitumen.

Industries of Siam.—The main industries of the country are fishing and agriculture, where for some years to come little opening will exist for the introduction of machinery.

Just on the outskirts of Bangkok there have been one or two electrically-driven pumps installed for the irrigation of rice fields on a more or less experimental scheme. that electric power is available it is possible that some extension of this nature may be developed, especially in view of the fact that the large Government irrigation scheme, which was to have cost some three million sterling, has had to be partially relinquished owing to the war in Europe. At present the methods of irrigation used are crude in the extreme, but probably an enormous amount of spade work will be required to introduce much in of modern methods. As a matter of fact, the implements and methods used at the present date differ little, if at all, from those used in the remote history of Siam.

Time was when Siam was a great sugar-producing country, but in recent years this industry has quite died away, and only a small amount of cane sugar is grown for local consumption. As regards cotton growing, nearly all the cotton produced is used locally, little or none being exported.

The teak forests of Siam are, of course, known all over the world; most of the teak logs are floated down the river to Bangkok for treatment at the various large sawmills there, many of which have already taken up electric driving and adopted electric cranes. Even up country one finds many small lighting plants at the various teak logging forests.

There must, in the near future, be considerable development as regards Siam's mining industries; already there are signs of considerable activity in tin mining, and the Government have at last woke up to the fact that the country can no longer neglect its mineral fields development. The most important industry is that of rice milling, and here the British have sadly neglected trade. Not so many years ago practically every bit of the rice-milling machinery came from England, but in recent years German firms, with engineers resident on the spot, have captured the whole of the trade.

The mills are mostly owned by Chinese; in fact, most of the trade of Siam is in the hands of the industrious Celestial. It takes time and patience to work up a trade with the Chinese mill-owners, but once a connection is well established, the Chinaman may be regarded as a sure customer who is not easily led away by any chance firm that happens to come along. Up to now very little attempt has been made to introduce spinning and weaving machinery, the native cloth being produced on a crude loom made out of wood and bamboo poles. In spite of the crude nature of the looms, the work done by the natives is of very good quality, and there should be a field for the introduction of proper weaving machinery.

Just recently one or two hand-looms have been imported, so that a beginning has been made, and there is no reason why this trade should not develop, even to the extent of electrically-driven weaving sheds.

Railways.—The recent orders for bridges and rolling stock for the Siamese railways have drawn manufacturers' attention to the possibilities of trade in this direction. The orders for the new signalling gear and other railway electrical apparatus for the new Bangkok Station were secured by the A.E.G., of Berlin, who had an engineer and office on the spot; English firms appear to have taken very little trouble regarding this offer. Train lighting is also a neglected field, although the Siamese are very much in favour of electric lighting on the railroads. A very plainly-worded history of the railway development of the country will be found in Mr. Graham's book already referred to, which also lays bare the early methods adopted by the Germans to secure the railway trade.

The first railroad in Siam was the line from Paknam, at the mouth of the River Menam, up to the capital of Bangkok, which was opened in 1893, and has a length of only 12 miles. In 1901 the Northern line was finished from Bangkok to Karat, some 165 miles, while in 1903 the Southern line, from the west side of the river to Petchaburi,

94 miles, was completed. Since the above dates the railway development has been quite rapid, and a few years' time will see the linking up of the Siamese railway system with that of the British Federated Malay States.

The Royal Railway Department Northern Line (broad gauge) is under German control, the director-general being Kgl. Baurat L. Weiler, while the Royal State Southern Line (metre gauge) is under English control, the controlling engineer being Mr. H. Gittins.

In conclusion, a few brief notes regarding the chief elec-

trical goods sold in Siam may prove useful.

Lamps.—Are lamps, mostly replaced by metal-filament lamps; trade chiefly in the hands of the supply stations themselves.

Motors and Fans.—Sold through local firms; nearly all the fans are of Italian and American manufacture.

Cable and Wires.—All house wiring is carried out with cable on cleat insulators; market flooded with German cable of low grade with which C.M.A. wires cannot compete. Much of the wiring and especially the ceiling roses, &c., are of a very poor quality that would never be allowed at home, fuses being frequently placed in both tumbler switches and ceiling roses.

Shades, Glassware, and Fittings.—These are mostly of German origin, but there is an opening for the various more modern and scientifically designed fittings in the better class houses.

Conduit Systems of wiring have not found favour, principally due to lack of good workmen, and to heavy condensation of moisture causing trouble.

Rice Mill Lighting.—Dust and damp proof fittings of strong design are badly required, and would be welcomed by the insurance people. All switches should be thoroughly well enclosed, as the dust is very penetrating.

Illumination Material, Electric Signs.—Owing to the various and frequent ceremonies and the Siamese love of brilliant illuminations, there is an extensive market for all material for such illumination work, especially the various forms of illumination strip, cheap coloured reflectors, thermo flashers. &c.

Motor-Car and Motor-Boat Lighting.—Bangkok and the river are thronged with motor-cars and motor-boats, and electric lighting on these is now most popular, as is also the use of electric horns.

The number of motor-cars in Bangkok (excluding Royal cars which are not registered) is just over 1,000. Electrically-driven cars are used to a limited extent, and the electrically-propelled motor-lorry appears to be about to gain favour, owing to the low rates at which current for charging can be obtained from the supply stations.

In the past the German firms have worked up the trade in a most systematic manner, keeping a fully-equipped office in Bangkok, and having also the advantage of securing the local supply company as agents. The Samsen power station contract, which went to Germany, cost over £48,000, exclusive of the station buildings and conveyor machinery, in addition to which, of course, the A.E.G. having once obtained a firm foothold, naturally secured all the extra orders for material, even down to the telephone cables for the Government Postal Department, the value of which has never been made public.

Tools for the workshops (English manufacture), fire hydrant service, oil tanks, &c., were all secured by the A.E.G., who appeared able to quote and supply particulars for the local erecting office, while local agents were helpless. This is precisely the German method from start to finish; they send out to the Colonies the very pick of their staff, who, by having a free hand, are able to "strike when the iron is hot" without the loss of valuable time that is too often taken up by our men in getting information or instructions from home. These men they carefully back up with ample supplies of both technical literature and catalogues. Moreover, every little detail as regards the requirements of the local market is carefully sent home for future use.

Only too often one finds that home firms send out untrained men, very often ex-ship engineers who have been discharged from the shipping firms, and imagine that a Colonial representative needs no other qualification than the ability to spin yarns and make himself generally sociable at the inevitable "Club."

THE LATE MR. WILLIAM BULLOCH.

BY A MEMBER OF HIS STAFF.

In last week's ELECTRICAL REVIEW there appeared a notice of the death of Mr. William Bulloch, with a brief account of his connection with the Electric Construction Company, Limited. May a member of his works staff be permitted to add a few details to the account of Mr. Bulloch's career, and to record, through the publicity of this journal, the extraordinary esteem in which their late Chief was held by his staff and workpeople?

William Bulloch was born in 1870 and educated at Aberdeen

William Bulloch was born in 1870 and educated at Aberdeen Grammar School. Upon leaving school, he was articled to the firm of James Meston & Company, Chartered Accountants, Aberdeen, and in due course was himself registered as a chartered accountant. In 1893 he joined the staff of the Electric Construction Company, Limited, at its Head Office in London. In the following year he took over the management of the commercial department at the Company's Works, Bushbury, Wolverhampton. Here he entirely re-organised the system of book-keeping, introducing a costing method of his own which is still in use.

In 1901 he became General Manager of the works, and two years ago (still retaining his position as Manager) he was elected to a seat upon the Board of Directors. There is no need to remind readers of this journal of the anxious times through which the electrical industry passed during Mr. Bulloch's period of Management at Bushbury; the fact that the E.C.C. came successfully through that period, and is now in a better position financially, and has a higher reputation William Bulloch was born in 1870 and educated at Aberdeen

MR. WILLIAM BULLOCH.

Whitlocks, Ltd.

as a manufacturing concern, than at any other time in its history, is a fitting monument to his skill as organiser and wisdom as manager.

history, is a fitting monument to his skill as organiser and wisdom as manager.

Big in frame, and of commanding personality, Mr. Bulloch was every inch a man and a master of men; withal, he possessed a simplicity and directness of character and a charm of manner which ensured a rule of respect unmixed with fear. Level-headed and confident, he was seldom ruffled, and, on those rare occasions when he did show anger, one felt that it was of deliberate intent. In the darker days, when we of his staff and works were constrained to shake our heads, as little men will, and to discuss anxiously this or that matter which seemed to threaten the welfare of our business, almost invariably we ended with the comforting assurance, "Oh, well, the Chief seems quite happy about it!" And this confidence in him he repaid by confidence in us. He indicated broad lines of policy, but seldom interfered, unasked, in matters of detail. Yet there was little that escaped him; he grasped instantly any problem that was put before him; nothing was too big or too small for his attention; with all his duties and responsibilities he always found time to discuss in his deliberate manner any difficulty that might be brought to him. Accessible at all times to any of his employees, from departmental head to office boy, works superintendent to yard labourer, no one with a legitimate need of guidance ever hesitated to apply to him. Many and extraordinary were the stories of private troubles that were told to him; much and valuable the assistance that he so ungrudgingly gave. Can it be wondered at that we at Bushbury feel we have lost more than a master, more than a chief?

What was the secret of his success as a business organiser and a commander of men? I think he himself unconsciously put it into words a few days before he died. The staff and

workpeople had been exercised in their minds over some detail in connection with a fund to which they were contridetail in connection with a fund to which they were contributing. A meeting was held; a meeting, by the way, which was remarkable for the sheer affection—there is no other word for it—for their Chief which ran as an undercurrent through the speeches of blunt working-men who were there to say what they had to say without fear or favour. Mr. Bulloch, who presided, explained briefly the purpose of the meeting, and with a "Well, gentlemen, I have thought a good deal about this," propounded a safe and equitable solution of the difficulty. tion of the difficulty.

There I think you have it: Well, gentlemen, I have thought

a good deal about this!

The remains of the late Mr. William Bulloch were laid to rest at Bushbury Parish Church on Saturday amid many manifestations of regret. The formal obsequies were attended by a large number of personal friends and representative of public bodies including the Wolverhampton Chamber of Commerce, the Wolverhampton and District Engineering Society, the Wolverhampton Conservative Association, members of the E.C.C. staff, and a numerous body of workmen. The officiating clergyman was the vicar of the parish, Rev. Percy Scott. The chief mourners were the family and relatives of the deceased.

THE INDUSTRIAL POSITION IN THE UNITED STATES.

Our American contemporary the Electrical World contains the following report of part of a speech on the present condition of electrical and industrial affairs, which was delivered in January at Boston by Mr. Guy E. Trip, chairman of the American Westinghouse Electric & Manufacturing Company: "A most serious situation confronts us. The country finds its industries generally in an unparalleled state of prostration, and it is worth while to speculate a little over what, if anything, we can do to mitigate this paralyzing depression. It is quite probable that we should have had very great business stagnation or worse even if there had been no war, and the effect of the war itself has been a surprise.

"The prevailing feeling in England and France, when the war broke out, was that a terrible situation confronted Europe,

"The prevailing feeling in England and France, when the war broke out, was that a terrible situation confronted Europe, but that great benefits would come to the United States; nevertheless, after six months, we find the situation just the reverse. So far as I can learn, the experience of the companies I represent is typical of present manufacturing conditions in the countries where we are situated.

"Our company in England is running at full capacity, while in this country our works are operating between 50 and 60 per cent. of normal output. The English company is not working upon war orders but upon its usual character of goods. This, of course, is due to the fact that England has been able to keep the seas clear for her commerce and that her colonies, and other countries which had been in the habit of dealing to a considerable extent with Germany, have transferred their keep the seas clear for her commerce and that her colonies, and other countries which had been in the habit of dealing to a considerable extent with Germany, have transferred their entire business to England. It seems to me that this will be a permanent condition; that is to say, if the Allies should win, England will derive greater permanent commercial benefit from the war than the United States will do. Our works in France are running full time, but to a very large extent on orders for the French war department. Our Italian works are running full time; and, judging from the very infrequent and vague news we can get through from Austria, our Vienna company is enjoying usual prosperity.

"Therefore, so far as our own interests are concerned, they are very much more prosperous in Europe than in the United States. It is true that there have been some war orders received in this country, but the effect has been a great deal more than offset by the great disturbance of foreign exchange and the difficulty of handling our large indebtedness to Europe.

"The war has also obscured the effect of the recent antitrust legislation and tariff reduction, and will obscure the effect of the proposed bill for government ownership of a merchant marine, should such a bill pass Congress, which I hope it will not do. We are asked to believe that these laws remove all barriers and that it only remains for us to get busy and seize the markets of the world from England and Germany.

"Anything that helps our export trade is good and we are all trying to increase foreign commerce, but our prosperity still rests upon our home markets. There are 100,000,000 people in the United States, and in comparative consuming capacity they weigh a great deal heavier than their numbers and the removal of any measure of encouragement and protection of home industries on the theory that the injury will be repaired by any increase in foreign trade that we are likely

tion of home industries on the theory that the injury will be repaired by any increase in foreign trade that we are likely to retain permanently in competition with England and Germany is a colossal mistake.

"The recent reduction in the tariff had, before the war,

the recent reduction in the tarm had, before the war, shifted the balance of trade against us; that is to say, the new tariff went into effect October 4th, 1913, with the result that, after many years with the balance of trade being continuously in our favour, in April, 1914, it swung the other way and imports began to be greater than exports. In addition to depriving the government of revenue, which resulted in the

income tax law, this would have had a very severe effect on our home industries, and upon the market for labour, even if there had been no war. It is true that the balance is now

our home industries, and upon the market for labour, even if there had been no war. It is true that the balance is now in our favour, owing to exports of war materials needed by the countries now at war, but the period between April 1st and August 1st of last year may have been a demonstration of the real effect of tariff reduction. It should be remembered that the export of raw material as distinguished from manufactured goods is a distinct disadvantage to labour.

"It is vital that this great market of ours should be in a fair degree protected against foreign competition even if we have to let export trade take care of itself, and to that end I believe your organisation and we ought to co-operate in encouraging a popular demand for a tariff commission which can intelligently pass upon this complicated and delicate question. While this is being done, and it will take some time, say until 1916, home industry needs a stimulant; and, after all, the most important thing for us to do, and the most sensible way in which we can co-operate at this time, is to join hands in bringing about a better business state of mind.

"When we come to think of it, there have been plentiful crops to feed and clothe the people, the railroads are ready and anxious to transport them, the mills are waiting to fabricate them, and labour is waiting to do the work. Is there not something we can do to help set these agencies in motion? It will help if we all agree that it is time to let up a little on conservatism and take some chances by beginning some of the work which is being held back. If there should be a

conservatism and take some chances by beginning some of the work which is being held back. If there should be a general movement and everybody should make a cautious start, taking a little but not too much risk, the result would

be surprising. be surprising.

"The manufacturer might begin the manufacture of a reasonable reserve stock of standard goods, and you can all utilise these dull times to overhaul and repair your roadbed, plant and machinery and make small additions against future growth. I hope you will not think that these ideas are impracticable and mere idle theorising; for, if there can be such a thing as co-operation in the business world which is worthy of the name this suggestion is the simplest form it can take." of the name, this suggestion is the simplest form it can take.

EXPORT TRADE OF SWEDEN.

The following figures, showing Sweden's exports of electrical and allied goods during 1912, are taken from the recently issued official trade returns. These, combined with the comparative figures for 1911 which have been added, afford an interesting view of the growth and diversity of Swedish competition in classes of goods and countries in which we also are interested.

POLYPHASE COMMUTATOR MACHINES AND THEIR APPLICATION.

By N. SHUTTLEWORTH, M.Sc., A.M.I.E.E.

(Abstract of paper read before the Institution of Electrical Engineers at Birmingham, February 10th, 1915.)

ENGINEERS at Birmingham, February 10th, 1915.)

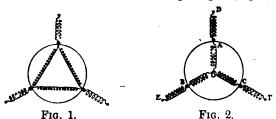

WHILE polyphase systems may have two, three, six, or more phases, reference will be made in every case to a 3-phase machine, and it will be understood that the principles involved apply to any other number of phases.

It will expedite matters first of all to enumerate the fundamental qualities possessed by an armature fitted with a commutator connected in series with a stator compensating winding in the presence of a rotating field. For 3-phase current the brush spacing on a commutator is naturally 120 electrical degrees. The closed circuit winding of the armature, so far as 3-phase currents passing in and out at the brushes are concerned, is equivalent to a delta-connected winding. The three separate phases of a compensating winding are placed in series with three brushes respectively, and they are distributed on the stator in such a manner that the currents passing through them neutralize the armature currents at all points along the periphery. Let it be now supposed that the delta armature-winding is replaced by an equivalent star-connected winding terminating in the brushes; it will be found that the three phases on the armature possess exactly the same number of turns as the compensating winding, and that they are wound immediately beneath and opposite in sense.

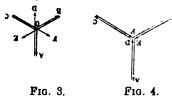

For most purposes it is simpler to consider, instead of the true windings represented in fig. 1, the equivalent windings shown by fig. 2. Each phase may then be considered sepa-

rately, and it is sufficient to remember that the equivalent star phase of the armature O A has the same number of turns, but is wound in the opposite sense to the compensating winding represented by A D.

The presence of a rotating field causes an induced voltage to appear at the terminals of each winding. Since, however, the armature turns O A are opposed to the compensating turns A D, the induced voltage O A must be opposite in sense to the induced voltage A D, with the result that there can be no voltage between the terminal D and the star point O. These relations are shown in the voltage diagram, fig. 3, from

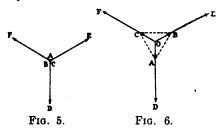

which it will be seen there can be no voltage between the terminals of the machine D E F, but that an appreciable voltage will be present at the armature brush studs represented by A B C. The frequency of the voltage at A, B, C, depends of course upon the frequency of the rotating field. If it now be assumed that the armature rotates slowly in the same direction as the rotating field, the relative velocity of the field to the armature has decreased, and the voltage induced in the armature must decrease also; no change can have taken place in the frequency of the voltage at the brushes, or in the magnitude of the voltage induced in the compensating winding, and the result will accordingly be as

shown in the vector diagram, fig. 4, where A B C is the armature voltage, and D E F the terminal voltage.

Proceeding further, examine the result when the speed of the armature attains to that of the rotating field, namely, synchronism. The field has now no motion relative to the armature conductors, hence there can be no voltage induced in the armature, and the voltage in the compensating winding remains the same as in the previous cases; the results represented by fig. 5 are then obtained.

The only remaining case is that of an armature speed higher than that of the rotating field; the direction of cutting of the field by the armature conductors becomes reversed, and

the phase of the voltage generated at the armature brushes is of opposite sense to the previous cases. Fig. 6 depicts the armature and terminal voltages under this condition.

is of opposite sense to the previous cases. Fig. 6 depicts the armature and terminal voltages under this condition.

There are two observations to make from figs. 3 to 6; one is that there is a different ratio of armature voltage to terminal voltage at every speed, and the other that the terminal voltage is exactly the same as regards magnitude as it would have been with a stationary field.

The rotating field determines two things; first, the seat of the voltage, namely whether it appears in the stator or the rotor; and second, the frequency of the voltage appearing at the armature and terminals of the machine.

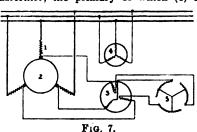

With these simple facts in mind the mode of operation of all commutator machines will become more clear.

Broadly speaking, there are two main types, classified according to the method of excitation, namely:—(1) Shunt, (2) Series. The former implies constant field, which is usually associated with constant speed under load, and the latter with compound excitation with varying speed under load.

Machines of the shunt type will be considered first.

It is evident that a single-speed commutator motor is practically useless; the only advantage over an induction motor is an improved power factor, but this is not sufficient to merit the increase in cost. The real advantage of a commutator machine is the pressibility of speed variation, which can be accomplished without loss of efficiency. A variable-speed polyphase shunt commutator motor is the prototype of the continuous-current variable-speed shunt motor. The many speeds are obtainable by simple regulation of the field excitation. many speeds are obtainable by simple regulation of the field excitation.

The first motor to be considered is one built to the design of M. Latour in France. The motor proper (fig. 7) is fitted with a 3-phase compensating winding (1), and a 3-phase armature (2). Instead of using a separate shunt exciting winding the armature winding is used for this purpose, and an exciting voltage is impressed between the brush studs from the secondary (3) of a transformer, the primary of which (4) is connected

to the supply system. The armature winding of the motor therefore carries in addition to the load current an exciting current, which produces the working field of the motor. The windings of the transformer (3) carry only a wattless current, which is at right angles in phase to the voltage induced from the primary. The latter fact enables a very simple means to be employed for varying the terminal voltage of the secondary of the exciting transformer, and for this purpose the star point of the secondary is completed through a variable reactance (5). A voltage-drop due to the magnetizing current flowing through the reactance (5) is exactly opposite in phase to the voltage induced in the secondary of the transformer; since the voltage appearing in the windings (3) is constant under all conditions, the terminal voltage impressed on the brushes of the motor will depend upon the magnitude of the voltage-drop in the reactance, and the reactance is therefore a means of varying the impressed voltage on the field winding of the motor—this being done also without any change in phase. It will be observed that the reactance (5) is strictly analogous to the field rheystat of a continuous-current shunt motor. to the supply system. The armature winding of the motor current shunt motor.

The transformer (3-4) must be made with a movable secon-

The transformer (3-4) must be made with a movable secondary, after the manner of an induction regulator. The phase of the voltage obtained from the secondary (3) may then be varied at will relative to the voltage in the primary (4).

A constant voltage is impressed on the terminals of the motor, and if it be assumed that the counter-voltage of the machine cannot differ appreciably from this value, the conditions are similar to those of a continuous-current shunt motor, the speed remaining constant so long as the field of the field of the field.

(To be continued.)

WAR ITEMS.

Russian Electric Lamp Industry.—At the last meeting of the Russian Electro-Technical Society, after a long and interesting discussion on the protection of the Russian Electro-Technical Industry, resolutions were adopted in favour of a more detailed classification of electro-technical favour of a more detailed classification of electro-technical goods imported into Russia, and more suitably adjusted tariffs on such goods as are imported in large quantities and would constitute separate branches of industry; and for the successful development of the National Lamp industry, it was resolved that it was essential that capitalists and industrialists should co-operate in the exploitation of wolfram, nickel, &c.: and that during the period of the development of an electric lamp-making industry in Russia, the Government should grant patent rights to foreigners with extreme circumspection, avoiding the issue of patent rights which in foreign hands would hinder the development of such an industry in Russia: and finally, that the Russian

which buyers at home and abroad desire to purchase in the United Kingdom.

Franco-British Trade Tour to South America.—We recently reported the organisation of an American business men's tour to South America in the interests of trade cultivation. It is now reported in the "Standard" that some 50 French merchants and 100 leading business men from different parts of England will shortly sail in the "Argonaut," a specially chartered French liner which has been renamed, for calling at numerous ports in South America. The ship will load samples at Southampton. The tour has been arranged by Kelly's British Trade Intelligence Department. Public meetings and receptions are being arranged by Chambers of Commerce, municipalities, &c., at different stopping places. The "Standard" adds that the project will doubtless be followed at a later date by Government action of a similar character in Russia and other markets. markets.

Proposed Russian Tax on Electricity.—The Imperial Russian Technical Society has presented a report to the Ministry of Trade and Industry on the proposed tax to be anistry of frade and industry on the proposed tax to be laid on electricity as its contribution to the war funds. The report shows that electricity has developed considerably in Russia, and that there are 102 stations in Russian towns producing electricity for lighting and power, amounting to 114,000,000kw.-hours per annum, value 24,000,000 roubles. The value of the annual output of the four stations of the capitals is stated to be 17,000,000 roubles. The report, we can not seem to the control of the capitals is stated to be 17,000,000 roubles. report, or memorandum, presses for the lowest possible tax, so as not to prevent the growth of electric lighting and power consumption in Russia. It suggests an excise or tax as follows: for street lighting -0.5 copeck $(1c. = \frac{1}{4}d.)$, for factories and workshops -lc., and for other purposes -2c. per kilowatt

hour.

Higher Wages.—The cost of living and the scarcity for skilled labour have led to demands for higher wages from the engineering and shipbuilding workers on Tyneside. Conferences are taking place. The employers have in some cases offered advances at the rate of 2s, per week immediately, and a further 1s, if the war lasts for six months. The "Times" savs that the north-east coast engineering employers also had before them on 11th inst, the highest demand which probably has ever been made by unskilled men in the engineering trades of the district—namely, 5s, a week on time rates, and 15 per cent, on piece rates.

French Relief Fund.—This fund which has offices at 83.

French Relief Fund.—This fund which has offices at 83, Pall Mall, S.W., has been established for the purpose of giving British assistance to French non-combatants rendered destitute by the war, and especially to alleviate the terrible distress caused by the inhuman conduct of the Germans to the ill-clad, suffering, and homeless women and whithers in the depreted from the formal suffering and homeless women and cermans to the in-clad, suffering, and homeless women and children in the devastated provinces of France. Assistance is urgently needed, and cash donations should be forwarded to the bankers, Messrs. Cox & Co., 16, Charing Cross Road. W.C., all cheques being made payable to the Committee, The French Relief Fund. Gifts of clothing and provisions to be sent to 495, Oxford Street, W.

Manchester Tramwaymen.—Over a thousand wives, mothers and children of Manchester tramway employees who are serving the colours were entertained at Belle Vue last week. The Lord Mayor of Manchester in a brief speech, stated that 35 per cent. of the corporation employees available for service had joined the forces, and he believed the tramways department had given the largest proportion. The general manager (Mr. J. M. McElroy) stated that there had enlisted 276 drivers, 442 guards, 179 trolley-boys, and 517 men from other branches of the tramways department.

Warning to Manufacturers.—The Admiralty has issued to

Warning to Manufacturers.—The Admiralty has issued to all contractors engaged on Government work, advice not to admit any persons to their works unless notice of their coming has been received in advance. The need for precautions arises from the fact that suspects, wearing the khaki uniforms of an officer and sergeant respectively, are attempting to visit military works making inquiries as to the presence of anti-aircraft guns in the vicinity.

Badges for War Workers.—In reply to a question asked in Parliament, Dr. Macnamara said that badges had been issued to employés engaged in works carrying out Admiralty contracts, fifty such works in the Lanarkshire district having been so supplied, for the use of men who were engaged continuously upon H.M. ships and armaments and whose skill and experience rendered their services absolutely indispensable.

Germany's Need of Copper.-The "Times" correspondent at Copenhagen says that a Danish merchant has been arrested for attempting to smuggle 40 tons of copper plates to Stettin and Lubeck in a schooner ostensibly laden with sugar.

Personal.—The following announcements appear in the "London Gazette":—Admiralty: Royal Marines, Submarine miners, February 5th, 1915. Lieut.-Col. Frederick George Scott, Tyne Electrical Engineers (Territorial Royal

George Scott, Tyne Electrical Engineers (Territorial Royal Engineers) to be temporary colonel.

Private Robert Adams, of Preston, up till recently employed at the works of Messrs. Dick, Kerr & Co., Ltd., Preston, has been killed on the battlefield.

Private Richard Ashcroft, of the Scots Guards, has been killed in action by a rifle bullet in the head. He was only 18 in December, and formerly worked for the Electric Car Company, Preston.

LEGAL.

EDWARDS v. MEXICAN LIGHT AND POWER Co., LTD.

In the City of London Court, on Thursday and Friday, last week, David R. Edwards, miner, made a claim against the Mexican Light and Power Co., Lt1, 21, Manning Arcade, Toronto, Canada, and 34, Bishopsgate, E.C., to recover £50 13:, 10.1 for damages for breach of contract, he having been a miner in their service. Mr. Slesser was connected for the plaintiff and Mr. W. Stowart expressed for the counsel for the plaintiff, and Mr. W. Stewart appeared for the

ME. STEWART said they would pay the debt and costs into Court if the case were adjurated until defendants obtained evidence from Mexico, without which they could not get a fair trial. Defendants employed hundreds of miners, and it would be very serious to them if they lost that case without a proper hearing.

ME. SLESSER opposed any adjournment, as the case had already stood over for two months for defendants to get what they wanted.

JUDGE ATHERIES. LONGS said he would hear the case.

wanted.
JUDGE ATHERLEY JONES said he would hear the case.
MR. SLESSER observed that the dispute arose out of the plantiff's employment in Mexico in connection with tunnelling works for the defendant company. Plaintiff, who had had experience as a miner, was engaged by the defendants to go to Mexico for them. He was told that the work would take three months at least, that he would be paid U.S. Stadey plus expense, and board and lodging, payment being made in American currency. He was told that he would have £10 advanced on account of wages, that he would have half-ney until arrival, free no saccount and home and full ney that he would have £10 advanced on account of wages, that he would have half-pay until arrival, free passge out and home, and full pay while working. When he arrived at New York he was given a new contract, but it was not read to him before he signed it. He found it contained several grave alterations to the terms agreed to in this country. One clause was that if the company thought his services were unsatisfactory they would be dispensed with. He was to forfeit all rights for various reasons spec fied, one being that men who were incapacitated from work would have their pay stopped, and forfeit their return passge mney, &c. Plaintiff worked at St. Lorenz, until the tunnelling was finished, when, owing to bad ventilation and improper presautions at the works, he fell ill, and was told he was discharged. He now claimed for his passage was told he was discharged. He now claimed for his passage home and half wages for some of the time occupied.

LAINTIFF Was called.

MR STEWART said that the plaintiff was discharged for wrongfully absenting himself without leave. He had used some disrespectful language.

JUDGE ATHERLEY-JONES thought it was very creditable of the plaintiff if he did so. It a company gave a man notice that he forfeited not only his benefits of employment, but his passage home, when he fall ill, it deserved stronger linguage than he (the

Judge) could employ.

MR. STEWART: There was nothing about illness in the notice,
PLAINTIFF said it was not true that he was suffering from the
jollification which followed the finishing of the junction of the

MR. STEWART said he could not call any evidence until the revolution in Mexico ended.

The JUDG & found for the plaintiff for the amount claimed, with costs.

ELECTRIC UTILITY Co., LTD.

In the Companies' Winding-up Court, Mr. Justice Astbury had before him on Tueslay, February 16 h, a motion by the original liquidator of the Electric Utility Co. to discharge an order made in Chambers, appointing Mr. John Edward Corfield as additional liquidator to act with him.

The company, it was stated, was formed in 1913, with a capital of £20,000, to take over the business of another company then in liquidation. The Master in Chambers had acted upon a resolution duly passed at a meeting of creditors, but the applicant's contention was that the resolution did not really represent the view of the creditors, as proxies were admitted which should not have been

His LORDSHIP thought there should be further evidence, and directed the motion to stand over generally with liberty to apply to rest re it.

ZUCKER v. PETERS.

In the Shoreditch County Court, on Tuesday, before his Honour Judge Cluer, Wm. Zucker, a hair-dresser, sued Sam Peters, also a hair-dresser, to recover £5, or the return of an electric motor hairbrush. The defendant pleaded that he should not have to pay for the electric motor. The one to buy the shop first was A. Both, who bought the motor from the Electric Motor Co., Ltd., and it became a fixture. On October 17th Roth sold to Zucker, with the motor, and on December 18th, Zucker sold to the defendant, he contended, with the motor brush, but now he was asking for £5 for it.

PLAINTIFF went into the box, and produced a note from the defendant, saying he would pay £5 if the brush was not given up by January 3rd.

DEFENDANT denied that he had had any dealings with the man DEFENDANT denied that he had had any dealings with the man in the box, and protested that his transaction was with the father. He produced an agreement to show that he purchased the business for £40, but directly his Honour saw it he said it was unstamped, and a penalty would have to be paid on it before it could be used. DEFENDANT: But it has outside the saloon "hair-brushing by electric brush" and to take it away is like removing a tool. JUDGE CLUER: Go and get that agreement stamped, and pay the penalty, and I can hear you. Adjourned.

PLAINTIFF: But he agreed in this letter to give it up if he did not pay by January 3rd.

JUDGE CLUER (looking at it): That is so, and that makes it an agreement. That will need stamping also; you have both been

agreement. That will need stamping also; you have both been cheating the Revenue, so I will adjourn this case to enable the Revenue to come into their just due; that is, if you want to go any further.

DAY v. WILLARD AND OTHERS.

In the Court of Appeal on February 10th, the Lord Chief Justice Lord Justice Swinfen Eady, and Mr. Justice Bray, heard the appeal of the plaintiff in this action, from a judgment of Mr. Justice Pickford. The plaintiff in the action was Mr. Wm. Thos. Day, of Shepherd's Bush, and the defendants were Mr. Chas. D. Willard, of Cromwell House, Surrey Street, E.C., Mr. F. H. Haviland, of Bournemouth, and Mr. Otto Stalmann, of 21, Tavistock Surara W.

PATRICK HASTINGS, appearing for the appellant, Mr. Day, MR. PATRICK HASTINGS, appearing for the appellant, Mr. Day, said Mr. Justice Pickford had given judgment for the defendants. It appeared that the plaintiff's case was that he entered into an agreement with the defendants under which they were to become co-adventurers in the promotion of a company for the exploitation of the patent of an electric smelting machine, the invention of a Mr. Marcus Ruthenburg. The parties were to participate equally in the shares of the company, and plaintiff alleged that although the agreement purported to be limited to a certain option, it was, in fact, one to carry out a transaction not limited to the duration of partnership, and notwithstanding that the matter had been compartnership, and notwithstanding that the matter had been completed by the other defendants, he was entitled to remain in the partnership. He also contended that the defendants went behind plaintiff's back and induced Ruthenburg to renew the option to them to the plaintiff's exclusion, and the Judge found as a fact that defendants had obtained the remarked of the state of the sta them to the plaintiff's exclusion, and the Judge found as a fact that defendants had obtained the renewal of the patent from Mr. Ruthenburg by making a statement that was untrue. Mr. Ruthenburg, in his evidence, said he was told that Mr. Day had made default in his agreement, and although the Judge found against the defendants on the ground that they had made statements that were not true, he decided against the plaintiff, holding that he had not made out his case. Mr. Hastings added that the company formed had a factory in Newcastle-on-Tyne for the purpose of making the electric smelters, called the North-Eastern Electric Smelting Co. His contention was that the Judge was wrong when he held that the plaintiff must prove a continuing wrong when he held that the plaintiff must prove a continuing

MR. SCHILLER, K.C., argued that, seeing that the contract with the plaintiff for the option of the patent fell through, the plaintiff could not claim when a new contract was entered into with the defendants simply because he introduced the matter to them.

The LORD CHARM TRACE.

The LORD CHIEF JUSTICE, in giving judgment, said the plaintiff claimed a declaration as he was kept out of the legitimate fruits of a project in which he was a co-adventurer. But the foundation of his case went when the facts were clearly brought out and of his case went when the facts were clearly brought out, and they held that the judgment of Mr. Justice Pickford was the right one, and the appeal failed.

The other Judges concurred.

NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

Automatic Lamp Cell Charging Apparatus.

In view of the success of the Thomson electric pocket lamp, MESSES. L. E. WILSON & Co., of 10, Corporation Street, Manchester, have decided to place on the market a simple recharging apparatus, shown in fig. 1, for the cells used in the lamps.

Where direct current is available, the patent porcelain holder can be screwed on the wall preferably adjacent to a switch, which should be changed for a special duplex switch. This

switch will operate a lamp in the ordinary way, or connect the patent recharging apparatus to the electric light circuit, with the lamp as a resistance. In other words, this recharging apparatus in no way interferes with the existing installation, but is always ready for use, and when once the poles are correctly defined and connected up, no chances of a reversal in polarity are possible. The introduction of a cell for recharging purposes makes very little

FIG. 1.-LAMP CELL CHARGING APPARATUS.

difference to the light. By this means the process of recharging the Thomson accumulator is quite simple and easy, it being only necessary to add some distilled water and slip the cell into the holder. A number of these patent holders can be connected up in series; whether a cell is inserted or removed the circuit is still maintained, and therefore either one or several cells can be recharged simultaneously.

Public Electric Vehicle Charging Station.

compact charging station for electric vehicles, which is enclosed in a weatherproof box and is mounted on a pedestal so that it can be placed near the curb, is shown in the accompanying illustration. A charging cable and plug are provided, and while the battery is being charged the door can be closed and locked. A regulating rheostat, ammeter, polarity indicator, lamp, switches, &c., are mounted on a slate panel, as shown in fig. 2. The box is of sheet-steel, and is electrically welded. The pedestal is of cast-

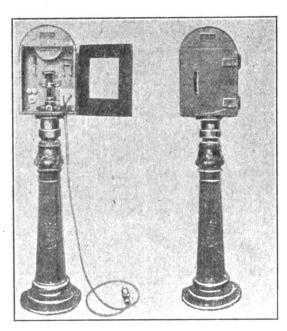

FIG. 2.—STREET CHARGING STATION FOR ELECTRIC VEHICLES

Connection with the direct-current supply is made through conduit passing underneath the pavement. A prepayment meter may be used if desired, but on account of the numerous sizes and kinds of batteries and varying conditions an attendant is usually

required.

This device for charging electric cars at the curb is made in two sizes, with ratings of 100 amperes and 150 amperes, and is being placed on the market by CLARENCE E. OGDEN, Cincinnati, Ohio.

Electrical World.

dimmed to 1 C.P.

This switch is made up of a two-way and off position Ediswan wedge type switch, fitted with a resistance wound on porcelain, and enclosed in a ventilated brass cover.

The switch absorbs about 15 watts, enabling a 12-in. fan to run down to about half speed, or a 25-c.p. metal lamp to be

The Runbaken Ignition Magneto.

Quarter-Turn Rod Coupling.

Our American contemporary, Power, describes an ingenious quarter-turn coupling, which has been invented by a Chicago engineer to replace a noisy bevel gear drive on a pump; this consists of two heads, bored to receive six rods of equal length. The jackshaft is horizontal and the pump shaft vertical; the coupling heads are merely solid pieces, bored for and keyed to their respective shafts. Within ½ in. of the circumference and spaced evenly around it, six holes are drilled to receive the rods comfortably. These rods are twice the length of a head plus the shortest exposed length shown in fig. 3. They are free to turn in their sockets and slide length-

Among the several new ignition magnetos for use on motor-cars that have been introduced since the stoppage of supplies from Germany is the Runbaken lately put on the market by the J. H. Runbaken Co., of 7, Peters Street, Manchester, the head of which concern is well known as a specialist in electrical ignition apparatus. The new magneto is stated to embody his experience

FIG. 7.—REAR-END VIEW, RUNBAKEN MAGNETO, SHOWING ALUMINIUM WATERPROOF LINING.

wise as the relative movements of the heads demand. When in

FIG. 3.—QUARTER-TURN ROD

COUPLING.

wise as the relative movements of the heads demand. When in the extreme position A, the ends of a rod are midway in the heads and in position B the ends are flush with the outer faces.

At first glance it would look as though the rods would twist together in a single turn of the heads, though this is not so. Several couplings of the same kind are in use. A 3 H P. motor drives a 3-in. centrifugal pump; the speed is 500 R.P.M., and at a distance of only a foot it is impossible to detect any noise from the coupling. The rods are well greased and as a precautionary measure a hood is placed over the coupling. The largest coupling is for a 10-H.P. motor, but there is no reason why higher powers could not be transmitted; it is merely a question of size. To be safe the combined area of three rods should be equal to the area of the shaft. of the shaft.

Ediswan Fan and "Dimmer" Switch.

We illustrate in fig. 4 a recently introduced pattern of Eliswan fan, which has been specially designed for steamship and train use, by the EDISON & SWAN U.E.L. Co., LTD., of Ponder's End, Middlesex. It has been constructed with a view to withstanding the action of sea air and hot climates, and to give sparkless and silent running.

The feature of this fan is its combined supporting device and connection; supports (or bases) can be installed where desired and

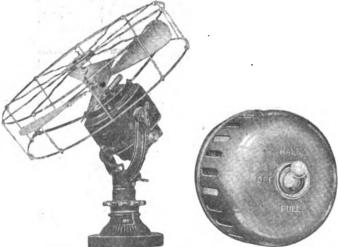

FIG. 4.—EDISWAN PATENT FIG. 5.—EDISWAN DIMMER OR REGULATING SWITCH.

the fan and motor fixed by the passenger in any support to suit his convenience, a bayonet-socket connection and clamping nut providing an easy means of doing this.

The swivel and trunnion movements enable the fan to be set to

blow in any direction.

The fans are constructed with 12-in. diameter blades and for pressures of from 50 to 250 volts, and can be provided with the switch illustrated in fig. 5, which is designed for use either as a starting and regulating switch, or as a dimmer switch for night lighting purposee,

with various types of foreign magnetos, and to be manufactured entirely of British materials. The machine presents a thoroughly workmanlike appearance, and although outwardly resembling the normal German-made magneto, it differs therefrom in various constructional features. Gun-metal is employed for the end plates and base; cast-iron for the pole-pieces; and aluminium for the

weather-proof internal housing.

One feature of the design is that the condenser is deeper than usual, and is accommodated entirely beyond the magnetic field, thus leaving the full length of the pole-pieces to produce magnetic lines that may be cut by the rotation of the armature, the result being that a powerful spark is obtained at low as well as at high engine speeds; the full range of movement of the advance and retard from one extreme to the other is 35°. The distributor plate is a composite slab of ebonite with a special quality of soapstone-like insertion, in which are affixed the bronze segments for the distribution.

The make-and-break mechanism is very similar to, and is inter-changeable with, that of the Bosch magneto. In place of the usual cams, however, a pair of roller-like pins are employed; these do not rotate, but are hardened and may be adjusted for wear. The contact heel of the rocker-arm of the make-and-break.con-

The contact heel of the rocker-arm of the make-and-break, consists of a dove-tailed block of red fibre.

The question of accessibility of the various parts has been carefully considered, while the method of collecting the current from the armature and passing it to the central portion of the distributor is also interesting. A spark-gap is provided to prevent any damage being done to the windings should there be no path any damage being done to the windings should there be no path for the current to get to earth through the sparking plug. It may also be mentioned that the earthing bush is located over the armature instead of beneath it, so that there is no risk of it being affected by oil. The high-tension leads are inserted in the fixed portion of the distributor, instead of on the removable cover-plate. The latter may thus be removed to expose the distributor for examination, without in any way disturbing the cables. The magneto is waterproof, and in this regard it is interesting to note that the magnets themselves are not used as part of the englosing material the necessary protection from it is interesting to note that the magnets themselves are not used as part of the enclosing material, the necessary protection from wet being secured by an aluminium casting located inside the magnets. Another point of note is the use of a disk of soft pliable metal riveted to the centre of the larger pinion of the two-to-one gear to prevent any possibility of the gears giving rise to a ringing noise. Again, all the screws that may require to be removed from time to time are hardened, while, as regards lubrication, this is secured by means of two conveniently-arranged oil baths on top is the magnets, whereat the requisite awall arount of oil research. of the magneto, whence the requisite small amount of oil passes to the three bearings needing it.

Bradford.—TRAMWAY WAGES.—At a meeting last week of tramway men employed by the Corporation it was decided to recommend the Executive of the Tramwaymen's Union to consider the advisability of making application for a general advance in wages of 15 per cent. The suggested increase is desired en account of the extraordinary circumstances created by the advance in food prices, and it is understood that the Executive have considered the recommendation and have decided that the suggested application should be made.

BUSINESS NOTES.

Australia.—A Sydney firm wishes to secure Australasian representation for British manufacturers of switches, electrical accessories, insulating material, &c. A merchant firm also wants agencies for British makers of electrical fittings and glazed presspann. The names can be ascertained at the Board of Trade Commercial Intelligence Branch in London, but letters may be sent direct to H.M. Trade Commissioner for Australia, 81, Pitt Street, Sydney, N.S W.

Callender's Hospital Fund.—A general meeting of callender's Hospital and Distress Fund was held on February 13th at the Belvedere Works, Mr. T. O. Callender presiding, at which the accounts for the year 1914 were approved. Though the membership had decreased owing to 42 members joining their regiments and ships, and 127 enlisting, yet the aggregate subscriptions reached the highest figure since inauguration year 12 years ago, and a larger sum than in any pregions, wear has been awarded to and a larger sum than in any previous year has been awarded to the hospitals. The excellent service rendered by the fund in other the hospitals. The excellent service rendered by the fund in other ways may be gathered from the following:—288 hospital letters were issued, 9 letters for special nursing homes, 81 surgical appliances were supplied, 17 surgical aid letters were given, 13 adults and 6 children were sent to convalescent homes, in 89 cases spectacles were provided, and 44 grants of financial assistance were made. The penny-a-week subscriptions produced £2×1, which is £9 better than in the previous year. The Callender Co. donated £50, Mr. T. O. Callender £5 5s., and several others two guineas each. The various sums awarded to hospitals and other institutions aggregated £283, as compared with £241 in the previous year. We learn from Mr. W. E. Wimhurst, the hon. sec. and treasurer, that in addition to the above the Callender employés have subscribed over £200 to the Prince of Wales's National Relief Fund. We congratulate those responsible for the conduct of the affairs of the fund upon so excellent a showing in what must have been a the fund upon so excellent a showing in what must have been a very trying year.

Book Notices.—Report No. 69 of the Engineering Standards Committee (London: Crosby Lockwood. Price 2s, 6d, net) on British Standard Tungsten Filament Glow Lamps (Vacuum net) on British Standard Tungsten Filament Glow Lamps (Vacuum Type) for Automobiles has just been issued. The subject was referred to the Committee by the Society of Motor Manufacturers and Traders, and was put in the hands of a Sub-Committee in May last year. The lamps dealt with are intended to have an approximate efficiency of 1 watt per candle; the newer gas-filled lamps will be covered in a later report. The standard voltages are 6 and 12 volts, and dimensions are fixed for the lamp bulbs and caps.

Henry Sell. 25s.

Bankruptcy Proceedings .- James William Tatter-SALL and TOM WHITTAKER TATTERSALL, residing at 4, Hillside SALL and TOM WHITTAKER TATTERSALL, residing at 4, Hillside Garden, Highgate, and carrying on business at Kimberley Road, Willesden Line, N.W., electrical engineers.—At the London Bankruptcy Court on Friday of last week, before Mr. Egerton S. Grey, the first meeting of creditors was held. In dealing with the proofs of debt lodged the Official Receiver said he had received a proof for £3,000 from Imperial Motors. It appeared that the directors invented an electrical starter for motor-cars and entered into an agreement with Imperial Motor Industries Ltd. under which the invented an electrical starter for motor-cars and entered into an agreement with Imperial Motor Industries, Ltd., under which the latter were to act as selling agents. A number of the starters were made, but it was alleged that they did not work properly, and the claim arose in regard to goods returned, money advanced, and money paid under a guarantee. After a long discussion, in the course of which directors said the amount should be £1,830 instead of £3,000, the Official Receiver eventually decided to admit the proof for which property of the \$1,830. st, 30 instead of \$3,000, the Official Receiver eventually decided to admit the proof for voting purposes at £1,830. The Official Receiver further stated that the debtor, James William Tattersall, informed him that prior to joining his brother in partnership he was in employment, and for some years was in New York. When he returned to this country he joined his brother in partnership and they commenced business as electrical and motor engineers. They afterwards invented an electrical starter and took out patents in England and France. When war broke out their business went in England and France. When war broke out their business went down considerably, and they were only able to sell a few starters each month. They placed their affairs before their creditors, who promised not to press them, and, in fact, some had since advanced them money in order to enable them to pay wages. They continued until December last hoping the war would soon end, but seeing no prospect of it doing so, they decided to file their petition in bankruptcy. They returned their liabilities at £3,653, and their assets at £480. Eventually it was decided to leave the estate in the hands of the Official Receiver for summary administration in the usual manner. the usual manner.

Italian Electrical Trade.—According to the Revistà Ieonica d'Elettricistà, in October international traffic resumed almost its normal course, and during that month machines, weighing over 1 ton, were received to the amount of 1,200 quintals, against 960 in the previous year, thus compensating for the deficiency in the two previous months. Lighter machines were imported in round figures to 1,200 quintals, against 1,400 in the previous year; transformers 883 quintals, against 1,200. Of lighter apparatus the imports were practically normal. The lighter apparatus the imports were practically normal. The imports of electrical machinery in November amounted to 4,861 quintals, against 4.102 in the same month of 1913. Machines weighing above 1 ton were imported to 884 quintals, against 1,106 in 1913. Lighter machines were imported to 980 quintals, against 1,341. Only in the case of transformers was a noteworthy rise observable, imports totalling 2,570 quintals against 1,477. Electrical apparatus were generally in decline—those weighing above 1 ton being imported to 514 quintals against 769; lighter apparatus were 134 quintals against 212.

Copper.—In view of the importance attaching to the German copper position and to the attitude of the British Government towards copper shipments from America to neutral European countries, returns have been issued by the Metal Information Bureau (L. H. Quin), 3, East India Avenue, E.C., showing that from August 5th to December 28th, 1914, 32 vessels carrying copper from America were detained, the total quantity involved being 19,550 tons. Of these vessels, one the Belgia (a German ship), sailed before war broke out and was headed for Hamburg. From Sentember 28th to October 9th four years is for Rotterdam were September 26th to October 9th four vessels for Rotterdam were held up, their cargo being purchased by Great Britain. Fourteen brate for Italy have been detained, all at Gibraltar, carrying about 9,000 tons of copper, 13 vessels for Sweden with about 5,500 tons have been detained in various British ports.

Catalogues and Lists.—Messes. Kohler Bros., 56, Ludgate Hill, E.C.—Illustrated descriptive pamphlet concerning the N.K.S. two and four-motor combined push-button and hand-

speed control equipments.

MESSES. MUSGRAVE & Co., LTD., St. Ann's Ironworks, Belfast. Folding card giving specification and tabulated dimensions, outputs,

&c., of enclosed double-acting engines.

Messes, Siemens Bros. & Co., Ltd., Woolwich.—Pamphlet A 706, giving a brief illustrated description of their watertight

door indicators for ships.

SIE W. H. BAILEY & Co., LTD., Albion Works, Salford.—Eightpage illustrated pamphlet (No. 2,614), giving particulars and prices of their "Silver Star" pump lubricators.

Foster Engineering Co., Ltd.—Mr. William Nicholson has been relieved from his appointment as Receiver on behalf of the first and second debenture-holders from February 10th, and the company is in possession of its assets and is trading on its own

Trade Announcements.—As announced in our last issue, the E.S. Co., LTD., has been registered to take over the business of the Electrical Supplies Co. The growth of the business has necessitated increased office accommodation at 53, Victoria Street, S.W., and premises for showrooms and stores have been obtained at 10, Spencer Street, Westminster. The company will, as its name suggests, deal in electrical supplies, and manufacturers' price lists are invited.

THE EFANDEM Co., LTD., of the Fallings Park Works, Wolverhampton, have acquired the whole of the business of the Scott Starter Syndicate, of Norwich, and will continue the manufacture of the Scott electric lighting and engine-starting dynamo motor for motor-cars.

Liquidations.—Molybdenum and Tungsten Traders. LTD.—This company is winding up voluntarily, with Mr. P. B. Smyth, of 638, Salisbury House, E.C., as liquidator. A meeting of creditors is called for February 24th.

SALSBURY LAMPS, LTD.—Particulars of claims must be sent in by March 20th, to the liquidators, Messrs. F. Westcott and A. Riding,

THE HIGH PEAK MAGNETO, LTD.—A meeting will be held at 32, Union Road New Mills, on March 17th, to hear an account of the winding up from the liquidator, Mr. J. G. Collier.

LIGHTING and POWER NOTES.

Abingdon.—Street Lighting.—The T.C. has decided to invite the Gas and Electric Supply Companies to tender for lighting the street lamps from Midsummer, on similar terms and conditions to the present contract, and also for a lighting installation in the new fire station.

-The Rosario Electric Light Co. has accepted Argentina.the conditions of the Municipality for a new contract for the supply of current for a period of 18 years.—Rev. River Plate.

Ashton-under-Lyne.—Public Lighting.—During the past month 17 street lamps have been converted from gas to

electric lighting.

The T.C. has decided to oppose the Stalybridge Joint Tramways and Electricity Board's Bill for the construction of additional tramways and extension of the area of electricity supply.

Australia.—During the past 12 months the Perth (W.A.) City Council sold 3,929,423 units, an increase of 72 per cent. over the previous year. Electric street lamps numbered 131 in the city and 95 in the Maylands and Mount Lawley districts. The new power station is expected to be available late in the year, and the erection of sub-stations is proceeding.

The Council has decided to supply municipal councils or road boards, within a radius of five miles of the G.P.O., with bulk alternating current at the actual cost to the city (which includes price paid to the Government for energy, together with distributing,

management, and financial charges).

Barnes.—Electric Cooking.—The U.D.C. has decided to install electric cookers in its workmen's dwellings. The elec trical engineer reported that an apparatus, consisting of a small oven, 14 in. × 12 in. × 12 in., with a boiling plate, would meet the requirements, and could be installed at £4 per cottage, including all wiring and fitting charges. The charge will be made through a pre-payment meter, and will be adjusted to cover cost of cooker and meter, in addition to the energy consumed.

-E.L. SCHEME.—At the Parish meet-Boroughbridge .ing of the town and Aldborough, which was held to consider the proposed electric lighting scheme, it was decided to request the local authorities to give reasonable assistance to the promoters in their endeavour to carry the scheme into effect.

Boston.—E.L. SCHEME.—The T.C. has accepted terms General by the promoters of the E.L. order, by which the Council is to have the option of purchasing the undertaking at the end of 21 years from the date of the order, and at every subsequent seven years, as a going concern by valuation. If practicable, the Council is to have the option of taking the whole of the undertaking, and if not, the Boston R.D.C. is to have a similar option as to that part of the undertaking in the rural area.

Burton-on-Trent.—RESTRICTED LIGHTING.—The Gas and Electricity Committee has decided to reduce the whole of the street lighting by one-half, and to reduce the illumination of those lamps in use by shading them. The Committee also recommends that the tradesmen should discontinue outside shop lighting.

-Special Tariff Rejected .-- The T.C. has Carlisle.again rejected the recommendation of the Electricity Committee again rejected the recommendation of the Electricity Committee that in the case of bulk supplies of energy under agreement on the restricted hour system, the fixed charge be reduced from £4 15s, to 15s, per kw. of demand per annum. The Gas Committee strongly opposed the proposal.

Carrickmacross. — Workhouse LIGHTING. — The members of the B. of G. have decided to install the electric light in the workhouse as soon as possible. The general wiring of the streets of the town has not yet been completed; a number of shopkeepers and also residents of private houses will use the electric light.

Chapel-en-le-Frith.—The B. of G. has been informed that the cost of installing electric light in the workhouse would be

Charleville.—The valuation of the Charleville Electric Lighting Co.'s station premises has been reduced from £30 to £20, and the valuation of £80 on posts and wires to £10.

Cleckheaton. - Works Extensions. - The U.D.C. has decided to extend the generating station at an estimated cost of £20,000, as recommended by the Council's consulting engineer. It was stated that the sanction of the L.G.B. could not be obtained until the new Spenborough Council (the combined townships of Cleckheaton, Liversedge, and Gomersal) was elected.

Combe Martin.—The P.C. has passed a resolution to the effect that the Bill of the Ilfracombe Gas Co., by which E.L. powers are sought, is detrimental to the interests of the parish, and is asking Sir Godfrey Baring, M.P., to oppose the measure in Parliament.

Continental Notes.—Norway.—The town of Notodden, which is one of the largest centres of the electrical industry in Norway, has, up to the present, been dependent on the purchase of all the energy required for municipal purposes. It is now reported that the municipality has unanimously decided to acquire the Saga Waterfall, which is situated within municipal territory; this will produce about 4,000 E.H.P., of which only 150 H.P. is used by the present owner.

SPAIN.—A concession has been awarded for the utilisation of the waters of the Rio Dulce for the production of electric power for the lighting of the town of Mandayons, and for industrial purposes.

A further concession authorises use of the waters of the Rio Isbor for the production of electric power for industrial purposes in the town of Isbor.—Brard of Trade Journal.

ITALY.—A new central station has just been completed and put in operation at Follonics by the Societá Elettrica Maremmans, of

Leghorn, for the supply of current to the various mines and townships in the district. The plant comprises three gas engines (two of 250 H.P. and one of 180 H.P.) coupled to three 3,600-volt alternators. The current is stepped up for transmission to a pressure of 15,000 volts, and then transformed to 260 volts for power purposes and 150 volts for lighting.

GERMANY.—It is reported that owing to the shortage of petro-leum, the Government is recommending the substitution of electric lighting as far as possible, and insulated iron wire is being intro-duced on account of the shortage of copper.

SWEDEN.—For some time the erection of a transmission line from Untra to Stockholm, with the view of transmitting electrical from Untra to Stockholm, with the view of transmitting electrical energy from the former place to the metropolis has been discussed, and it now appears that the project will be realised, as an application for the necessary concession has been made. The scheme will involve a capital expenditure of no less than £750,000.

Belgium.—It is reported that as a result of the British air raid on Zeebrugge, the Rombach Central Electric Works was obliged to stop work, and for want of motor power the bridges could not be worked.

-Proposed Loan.—The T.C. has applied Darlington.to the L.G.B. for a loan of £18,550 for extensions to the electricity works, and for the period of the loan of £9,500 granted for mains, services, and transformers, to be extended from 15 to 25

Dublin.—PROPOSED INCREASED TARIFF.—The Electricity Supply Committee has agreed that the increased cost of coal for the Pigeon House generating station, and the maintenance of a regular supply, will have to be met by an increase in charge to consumers.

East Sussex.—Prov. Orders.—The C.C. has decided to oppose the application of the Tunbridge Wells T.C. for a prov. order extending the area of supply to rural parishes in the Council's and also the East Grinstead Urban District prov. order for E.L.

Glasgow.—The Cattle Markets Sub-Committee is to consider, in view of the considerable rise in the price of carbons, whether it will alter the system of lighting.

Hayward's Heath. - Prov. Order. - The Urban Council has requested the B. of T. to postpone the Mid-Sussex Electric Lighting Order until six months after the termination of the war.

Heywood. — The Corporation has decided that from March 31st next a minimum rate of 20s. per annum shall be charged for electrical energy for any four quarters, and that the hire of motors be for 12 months certain, six months' notice to be given of the intention to discontinue hiring.

Holme. — E.L. Scheme. — A Committee has been appointed to go into the question of providing an electricity supply. The district, at present, has neither gas nor electricity, and it is understood that already there are 50 persons who are willing to become subscribers to the supply.

Holmfirth,-Loan Sanction.-The Council has received from the L.G.B. sanction to borrow for electric lighting purposes:—£3,591 for buildings; £3,228 for generating plant, &c.; £549 for meters and battery; and £132 for street lamps. The Council decided to complete the contract with Mr. Broadbent, of Huddersfield.

Ipswich.—Proposed Loan.—The T.C. has decided to apply to the L.G.B. for sanction to a loan of £3,100 for purposes of the electricity undertaking.

London.—Woolwich.—In response to the Borough Council's request, the Finance Sub-Committee of the L.C.C. has considered the postponement of accelerated loan repayments in regard to the Plumstead plant, &c., and now proposes that such accelerated repayments should commence when the Council's new turbine plant is brought into use. This short postponement, however, does not meet the views of the B.C.; the Finance Committee has decided to urge the L.C.C. to sanction, without delay, the borrowing of £35,000 on account of the £48,000 now being applied for, in view of the serious overdraft incurred. In regard to the further application for borrowing powers for £10,000 for a \$0.00-kw. turbine set, the L.C.C. Finance Committee has intimated that it does not propose to deal with it pending further information in connection with loan repayments and plant, which will be supplied as soon as Sir John Snell has prepared a memorandum on the matter.

matter.

Shoreditch.—The B.C. is recommended, to avail itself of the offer of a loan for the electricity undertaking of £11,481, at 4½ per cent. per annum, from the Rational Association Friendly Society. The application to the L.C.C. for the loan at 4½ per cent. per annum has been withdrawn.

L.C.C.—The Finance Committee recommends the Council's sanction to the application of the Poplar B.C. for £8,173 for mains for the electricity undertaking.

The L.C.C. Fire Brigade Committee is installing electric radiators in the appliance rooms at the Bishopsgate, Brompton, Euston, Holborn, Old Kent Road, Redcross Street, Shadwell and Shoreditch fire stations.

fire stations.

-The B.C. has been recommended to enter into an BERMONDSEY .agreement with the County of London Electric Supply Co. to supply energy for the pumping purposes at the Vine Street depôt, on a sliding scale, varying from a maximum of 1 d. to a minimum of 1d. per unit.

Manchester.—Restricted Lighting.—The Tramways, Gas and Electric Lighting Committees have decided that all street lamps are to be shaded at the top, also the top lights in tramcars.

Arrangements have also been made for turning off all lights in the city, or parts of the city, if necessary.

Ormskirk.—As the result of negotiations, the differences between the U.D.C. and the Ormskirk Gas Light Co. have now been settled, and the Council has withdrawn its opposition to the Lighting Bill now before Parliament. The Gas Light Co. has agreed that, in consideration of laying extension mains to the Parbold district, it will undertake on no account to charge more for gas supplied to any consumer in the Ormskirk area, and that any new electric lighting mains shall be placed underground; further, that Clauses 45 and 46 of the Bill shall be withdrawn. It was contended that if Clause 45 had gone through, the company would have been empowered to buy out the present electric light undertaking, and thereby would have created a monopoly in regard to the lighting of the town.

Queensferry.—E.L. Scheme.—At a recent meeting of the parishioners it was decided that the suggested scheme for lighting the district by electricity should be a municipal one.

Ripon.—E.L. Scheme.—A petition is to be presented to the City Council requesting it to arrange with the Army authorities for the supply of electricity from the camp generating station. The neighbouring townships of Bedale and Masham have electric lighting, and the Boroughbridge authorities have been urged to adopt this mode of lighting, and at Ripon there is a strong feeling in favour of a supply of electric current,

Rochdale. — STREET LIGHTING. — The B. of G. has decided to proceed with the lighting by electricity of Birch Hill Lane as soon as possible.

Stockton-on-Tees.—Loan Application.—The T.C. has applied to the L.G.B. for a loan of £4,000 for two new rotary converters, &c., for the electricity works.

Slaithwaite.—E.L. SCHEME.—The Council has decided to apply to the B. of T. for approval of the use of overhead lines, and the Council's electrical engineer has been instructed to prepare plans, &c. A Sub-Committee has been appointed to report on steam and suction gas for motive power, and decide as to which of these forms of power should be employed.

Swansea.—The extensions at the Corporation electricity works are nearly completed, and represent an outlay of £40,000. The Electricity Committee is extending the cables to Town Hill to light the new workmen's cottages.

Swinton and Pendlebury.—Street Lighting.—The bulk of the electric street lighting scheme has been carried out, but owing to difficulty in obtaining material, it is impossible to estimate the probable date of the completion of the work. The lamps along Manchester Road, Chorley Road, and part of Bolton Rad have been switched on, but lamps for the remainder of the fittings have not yet been delivered.

Swindon.—Alterations are to be made to the flues and a water baffle is to be fitted at the electricity works with a view to preventing the escape of grit and dust from the chimney.

Tipperary.—Workhouse Lighting.—Mr. A. E. Porte has furnished a supplementary report on the cost of improving the electric lighting plant of the workhouse. The total amount given is £625; but there is an addition of £25 for tuning up the existing plant and cells, with a further £10 to £15 for buildings or foundations.

Tottenham.—RESTRICTED LIGHTING.—The D.C. is recommended to accept the offer of the North Metropolitan Electric Power Supply Co. for a reduction of 50 per cent. in respect of arc lamps which were not lighted during the December quarter.

Truro.—Prov. Order.—The City Council has been informed that the B. of T. would be prepared to favourably consider an application, in August, for the postponement of the revoking of the prov. order for a period of 12 months, on certain conditions

Urmston.—Proposed E.L.—A Sub-Committee has been appointed to report upon the question of introducing electric lighting in the district.

Worcester Park.—The South Metropolitan E.L. Co. is re-applying for a prov. order for E L. at Worcester Park.

Wednesbury.—INCREASE OF PRICE.—The Electricity Committee of the Corporation has given notice that, as from January 1st, 1915, the price of current would be increased by the addition of 15 per cent. on the net amount of the account, as the Mond Gas Co., which supplies gas for generating purposes, has notified its intention to raise the schedule prices for gas. The Committee states that the ability of the Mond Gas Co. to continue its supply to the Corporation depends on the length of the war and the conditions of industry, but the Committee hopes it will be unnecessary to announce any further increase in the price of electricity, and that it may be possible within a short time to reduce the temporary increase of 15 per cent. now rendered necessary. The increase will seriously affect big manufacturers in the district, several of whom take a large supply of current, both for lighting and power purposes.

Yorkshire Electric Power Bill.—Following the meeting of the West Biding Urban and District Councils and the subsequent action of some authorities in regard to the Bill promoted by the Yorks. Electric Power Co., decisions have been arrived at by the following Councils:—The Huddersfield and

Wakefield Corporations have resolved to oppose the Bill; the Bawdon District Council has decided to support the Bill on conditions; the Denby and Cumberworth District and Wharfedale Bural Councils have decided to support the West Biding District Councils' Association's opposition; the Holme U.D.C. has decided to take no action; and the Meltham U.D.C. has decided to request the company to strike its area out of the Bill. The Shepley U.D.C. is also opposing.

TRAMWAY and RAILWAY NOTES.

Aberdeen.—P.A.Y.E. Cars.—At a meeting last week of the Corporation Tramways Committee on the question of abolishing the P.A.Y.E. cars, a decision was deferred until August.

Cardiff.—Traffic Results.—The accounts for 1914 of the city tramways showed an increase to July last of £3,000, as compared with the corresponding period of 1913. Since the war this gain has been changed to a decrease of nearly £2,000. But for the war the increased traffic receipts, it is estimated, would have amounted to nearly £6,000.

Edinburgh.—Female Conductors.—A scheme has been discussed by the Edinburgh Tramways Co. to employ women as conductors on the cars, and it is expected that it will shortly be put into operation.

Hindley.—The Wigan Tramways Committee is to consider the extension of the tramways by constructing a new line from the present terminus along Market Street, Hindley, and up Castle Hill.

Huddersfield.—The T.C. has decided to oppose the Halifax Corporation Parliamentary Bill, which deals with various tramway extensions.

Glasgow.—Assessment.—The T.C. has been informed that the valuation of the tramway undertaking, by the Assessor of Railways and Canals for the year 1915-16 is £281,770, as against £280,490 for the previous year.

L. and Y. Railway Electrification. — The annual report of the company states that progress is being made with the electrification of the line between Bury and Manchester. During the past year \$42,698 has been spent on the power station which is being erected at Clifton Junction and on sub-stations, and £14,788 has been expended on the conversion of the line. The new line will be run on the third-rail system, in the same way as the Liverpool-Southport line, but at a different voltage. Intervening stations are to be made at Woodlands Road, Crumpsall, Heaton Park, Prestwich, and Radeliffe. With regard to electric traction, the company's returns show that the number of trains worked by electric power has increased from 159 to 174. The mileage of electric trains has advanced from 1,765,879 to 1,848,923, an increase of over 83,000 miles.

London.—The G.N. and City section of the Metropolitan Railway has now been provided with 1st class accommodation between Moorgate Street and Finsbury Park, this being the first "tube" to cater for 1st class passengers. The time of the journey has been reduced to 9 minutes.

L.C.C.—The one mile of experimental conduit side alot on the Shoreditch to Stamford Hill section of the Council's tramways is to be replaced by the centre slot system.

Manchester.—As a result of the discussion of the Executive Committee of the Tramway and Vehicle Workers' Union, the members of the Manchester branch on Sunday decided to apply to the Corporation Tramways Committee for an increase of 15 per cent. on the present wages. The application is made on the ground of the high prices of food, and the Committee will be asked to concede the increase until such period after the war, when food prices shall have returned to the normal.

Mansfield.—The Mansfield and District Light Railways Co. has applied for an extension of time until April, 1918, for completing the lines in Sutton-in-Ashfield and Skegby.

N.E. Railway Electrification.—In their annual report the directors of the North-Eastern Railway Co. say that it is anticipated that the electrification of the line between Shildon and Newport will be completed in the summer.

The mileage of electric trains was 1,257,581 as against 1,255,235 in 1913.

- Northampton.—FAR COTTON EXTENSION.—The T.C. is making representations to the B. of T. concerning the delay on the part of the L. & N.W.B. Co. with regard to the opening of the tramway track to Far Cotton, owing to the non-completion of that portion of it which crosses the railway at a level crossing. The lines have been laid down for a month or two, but the signalling apparatus has not yet been fixed in order to allow the cars to cross.

Scarborough.—Fire.—Damage to the extent of £200 was caused to the premises and electrical apparatus at the electric tramway depôt by a conflagration which broke out in the early hours of Saturday last,

TELEGRAPH and TELEPHONE NOTES.

Basingstoke.—On the recommendation of the Fire Brigade Committee, the Council has accepted the quotation of the Post Office telephone authorities, at £4 per annum per mile of fire alarm wire, and 5s. per point.

United States.—The Government has permitted the Marconi Wireless Telegraph Co., of America, to re-open its station at Siasconset, Mass., which was closed on September 25th, 1914, by order of the President.—T. and T. Age.

China.—Hitherto the Japanese Consulate and the Japanese residents in Shanghai have depended on the Great Northern Telegraph Co. for telegraphic communication with their country. As the term of the 25 years' contract has expired, the Japanese have made arrangements to take the cable under their own control. As however, many of the intermediate posts are in Chinese territory, the Japanese and Chinese Governments have agreed to co-operate in working the cable, and to form a special company, with the title of the Sino-Japanese Telegraph Co., for the purpose.

CONTRACTS OPEN and CLOSED.

OPEN.

Aberdare.—March 6th. U.D.C. Twelve months' supply of cables, meters, joint-boxes, &c., lamps, uniforms, tickets and other stores. See "Official Notices" February 5th.

Australia.—Brisbane.—March 10th. Motor-generator, power board, &c., for Postmaster-General. See "Official Notices" January 15th.

April 7th. Wheatstone receivers and transmitters, for the Postmaster-General. See "Official Notices" to-day:

MELBOURNE.—March 16th. White Wheatstone receiving tape, for Postmaster-General. See "Official Notices" February 5th.

Bedwas. - March 4th. Electrical goods for 12 months, for the Bedwas Navigation Colliery Co., Ltd. Forms of tender from the Secretary.

Belfast.—March 15th. Twelve months' supply of stores for the Tramways and Electricity Committees. See "Official Notices" to-day.

Blackburn. - Iron, steel, bolts, screws, &c., for the Tramways Department. Mr. J. H. Cowell, General Manager.

Bolton. - March 4th. Corporation. Twelve months' supply of stores for the Electricity Department. See "Official Notices" to-day.

February 22nd. Corporation. Twelve months' supply of tramway stores, including lamps, carbons and insulating material, for the Tramways Committee. Forms of tender from Mr. J. Barnard, Tramways Manager.

Bradford. — February 22nd. B. of G. 800 electric incandescent lamps, for the North Bierley Union. Particulars from Mr. W. G. Cooper, Clerk, Union Offices, 4, Town Hall Street.

Cardiff. - February 22nd. Installation, 750 points, at new Technical Institute, Cathays Park, for the City Council. See "Official Notices." January 22nd.

Twelve months' supply of - April 1st. stores, for the Electricity and Light Railways Committee. Forms of tender from Mr. F. H. Corson, General Manager, Light Railways Offices, Bristol Road,

Guildford.—Water softening and filtering plant, 50,000 gallons per hour, for Guildford Electricity Supply Co., Ltd. See "Official Notices" to-day.

Huddersfield.—March 2nd. Corporation. Electricians' work at new Tuberculosis Hospital. Forms of tender from Mr. K F. Campbell, Borough Engineer.

Hull,-March 2nd. Air-space telephone cable, for the Telephone Committee. See "Official Notices" to-day.

Ilford. — February 23rd. U.D.C. Twelve months' supply of stores for the electricity works. See "Official Notices" February 5th.

Leeds.—February 20th. Corporation. Twelve months' supply of stores for Electric Lighting Department. See "Official Notices" January 22nd.

February 22nd. Corporation. Twelve months' supply of electrical sundries, for the Tramway Department. Forms of tender from the Tramway Manager.

London.—ISLINGTON.—February 24th. B.C. Twelve months' supply of electrical stores. See "Official Notices" Twelve February 5th.

WIMBLEDON.—February 22nd. Corporation. Twelve months' supply of stores for the Electricity Department. See "Official Notices" February 12th.

Notices" February 12th.

FULHAM.—February 24th. B.C. Twelve months' supply of electrical stores. See "Official Notices" February 12th.

HAMMEBEMITH.—February 24th. B.C. Twelve months' supply of general electricity stores, See "Official Notices" February 12th.

BATTERSEA.—March 2nd. B.C. Supply of stores for Electricity Department. See "Official Notices" February 12th.

WESTMINSTER.—February 24th. B. of G. Six months' supply of electric lamps, fittings, &c., for the Westminster Union. Forms of tender from the Clerk, Princes Row, Buckingham Palace Road, S.W.

HORNSEY.—March 16th. Meters cables and stores. &c., for the

HORNSEY.—March 16th. Meters, cables and stores, &c., for the T.C. See "Official Notices" to-day.

Macclesfield.—March 10th. Cheshire County Asylum, Parkside. Electrical goods for one year. Forms of tender and particulars from Mr. Wm. Tingay, Clerk of Asylum.

Manchester.—March 2nd. G.C. Railway Co. Six or twelve months' supply of wires, cables, carbons, electrical accessories, lamps and telegraph material. Forms of tender from Mr. W. Williams, Stores Superintendent, G.C.R., Gorton.

February 23rd. Two low-pressure circulating water pumps, for Stuart Street generating station. Specifications from Mr. F. E. Hughes, Secretary, Electricity Department, Town Hall.

Newport (Mon).—March 2nd. Electric light fittings, for the B. of G. Mr. A H. Rees, Clerk, Queen's Hill.

New Zealand.—May 3rd. Electrically-driven turbine pumps of 80,000 and 100,000 gallons capacity per hour, together with direct-coupled motors. Commercial Intelligence Department, Board of Trade, London.

Oldham. - February 24th. The Electricity Committee invites tenders for the erection of an accumulator stores in Churchill Street East. Borough Surveyor's office.

- March 8th. U.D.C. Twelve months' Pontypridd. stores for Electric Light and Tramways Department. See "Official Nutices" to-day.

Kotherham. — February 22nd. Corporation. Two water-tube boilers, automatic mechanical stokers, economisers, superheaters, foundations, steel chimneys, steam valves, steam pipes, induced-draught plants, and all auxiliaries. See "Official Notices" January 29th.

Salford.—February 22nd. Twelve months' stores for the Tramways Department. General Manager, 32, Blackfriars Street.

March 6th. Three motor-converters or rotary converters and

transformers of 1,000 kW., and one motor or rotary converter and transformer, of 500 kW., for the Borough Electricity Department. See "Official Notices" to-day.

Swindon.—March 13th. Corporation. Twelve or six months stores for Electricity and Tramways Departments. See 'Official Notices" to-day.

Wigan. -- March 2nd. Twelve months' stores and m sterials for the Tramways Department. Mr. F. Buckley, General Man ger, Market Place.

CLOSED.

Barnes. - The U.D.C. has accepted the following

Siemens Bros. & Co., Ltd.—Feeder cable, £145. Edison Accumulators, Ltd.—Four electric dust vans, £915 each.

Bolton.—The Tramways Committee has accepted the tenders of the following firms for the purchase of scrap metal:— H. Bessemer & Co., T. Mitchell & Sons, R. E. Roberts, O. A. Byder,

Kay & Co.
The Electricity Committee has accepted the tender of Messrs.
B. Talbot & Sons for alterations at Spa Road generating station.

Bristol.—The Docks Committee of the Corporation has accepted the tender of the Wells Electrical Co. for the supply of arc lamp carbons.

Connah's Quay. - Messrs. Johnson & Phillips, Ltd., have received a provisional order from the U.D.C. for overhead and underground mains, public lighting and services.

Halifax.-Messrs. Lewin & Murray, of Halifax, have secured the order for the electric light installation at the Bermerside In titution.

Glasgow.—The Tramways Committee has recommended the acceptance of the following:

Trolley ord.—W. C. Ynille & Co., Ltd. Special trackwork.—Lorain S;eel Co.; Titan Trackwork Co., Ltd.; Edgar Allen & Co., Ltd. Three-core cable.—British Insulated & Helsby Cables, Ltd.

Messrs. Allan, Arthur & Ure have secured the contract for the electric lighting of Corporation-owned tenements in Gallowgate and Hill Street, at £171.

Heywood .- The following tenders in connection with the bulk supply scheme have been accepted :-

Converting plant, s.H.T. switchgear and sub-station plant.—British Westinghouse Co., Ltd.
Overhead mains.—B.I. & Helsby Cables, Ltd.
Switchboard and cables.—Bertram Thomas.
Battery booster.—Phœnix Dynamo Co.

Holmfirth.--The District Council has decided to complete the contract with Mr. Broadbent, electrical engineer, of Huddersfield, for carrying out the electric lighting scheme of the Council, involving an expenditure of £7,500.

Ilford. - Owing to the difficulty in obtaining supplies of coal under contract, the electrical engineer has accepted an offer of 200 tons of Kingsbury nutty slack at 12s. 11d., 160 tons of Pinxton 1-in. slack at 14s., and 170 tons of Pinxton slack at 14s. 6d. per ton.

Ipswich.—The T.C. has accepted the following tenders:

France & Chalmers.—Steel bunkers, elevator and coal-conveyor plans, including a wagon tipper, at the electricity works, £2,320.

Catchpole & Co.—Enlargement of the refuse destructor, £1,680.

Heenan & Froude.—Destructor cells, boiler-flue connections, &c., £3,187.

Royce, Ltd.—Electric crane, £185.

Keighley. - The Joint Hospital Board has accepted the tender of Messes. H. Spence & Sons for electrical work.

London. - CAMBERWELL.-The Borough Council has accepted the tender of the Brimsdown Lamp Works, Ltd., for an annual supply of electric lamps,

Wool wich.—The B.C. has accepted the tender of Messrs. Bruce Peebles, Ltd., for a 1,000-kw. motor-converter, at £2,150.

Newport (Mon.). — The Electricity and Tramways Department has placed a contract for the next 12 months' requirements of certain electrical accessories, including switches, with Messrs. J. H. Tucker & Co., of Birmingham.

Swansea.—The tender of the British Thomson-Houston Co., Ltd., has been accepted by the E.L. Committee, at £55, for the supply of an earthing resistance.

West Bromwich.—The T.C. has accepted the tender of the B.I. & Helsby Cables, Ltd., for cable, and that of Edison Accumulators, Ltd., for four electric chassis for 'buses, at £3,560.

FORTHCOMING EVENTS.

Institution of Mechanical Engineers.—Friday, February 19th. At 8 p.m. At Storey's Gate, S.W. Annual General Meeting. Paper on "Convertible Combustion Engines," by Mr. A. E. L. Chorlton.

Boyal Institution of Great Britain.—Friday, February 19th. At 9 p.m. At Abemarle Street, W. Paper on "The Visit of the British Association to Australia." by Prof. H. E. Armstrong, F.R.S.

Baturdays, February 20th and 27th. At 3 p.m. Lectures (I and II) on "Recent Researches on Atoms and Ions," by Prof. Sir J. J. Thomson, F.R.S.

F.B.S.

sociation of Mining Electrical Engineers.—Saturday, February 20th, At 4.30 p.m. At Royal Technical College, Glasgow. Paper on "Some Experiences in the Handling of Electricity," by Mr. A. Smellite.

(South Wales Branch).—Saturday, February 20th, At 6.30 p.m. At Technical College, Swansea. Paper on "Typical Breakdowns in Colliery Electrical Plant and their Prevention," by Mr. L. Foster.

Saturday, February 27th. At 6 pm. At Carlton Café, Queen Street, Cardiff. Paper as above, by Mr. L. Foster.

(Notts. and Derbyshire Branch).—Saturday, February 20th. At 3.30 p.m. At University College, Nottingham. Discussion on paper by Mr. L. Foster.

(Notts, and State of the College, Nothingman, At University College, Nothingman, At University College, Nothingman, At C. 15 pm. Lecture on "Firedamp and its Detection," by Prof. At 6.15 pm. Lecture on "Firedamp and its Detection," by Prof.

Royal Society of Arts.—Monday, February 22nd. At 8 p.m. At John Street, Adelphi. Fothergill Lecture (II) on "Motor Fuel," by Prof. V. B.

Wednesday, February 24th. At 8 p.m. Paper on "The Economics of the War," by Dr. W. J. Ashley.

Association of Supervising Electricians.—Tuesday, February 28rd. At 8 p.m. At 8t. Bride's Institute, Bride Lane, E.C. Paper on "D.C. Motors," by Mr. E. F. Butler.

Institution of Civil Engineers.—Tuesday, February 28rd. At 8 pm. At Great George Street, Westminster, S.W. Paper on "The Electrolytic Action of Return Currents in Electric Tramways on Gas and Water Mains; and the Best Means of Providing against Electrical Disturbances," by Mr. H. E. Yerbury.

nstitution of Electrical Engineers.—Thursday, February 25th. At 8 pm. At Victoria Embankmens, W.C. Paper on "Electricity Applied to Mining," by Mr. C. P. Sparks.

(Manchester Local Section).—Tuesday, February 33rd. At 7.30 pm. At Engineers' Club, 17, Albert Square. Paper on "Training for the Industrial Side of Engineering."

Western Local Section.—Tuesday, February 23rd. At 5 p.m. At Institute of Engineers, Park Place, Cardiff. Chairman's address by Mr. D. E. Roberts. Paper on "Electricity Applied to Mining," by Mr. C. P. Sparks. Informal Dinner. Mr. D. E. R C. P. Sparks.

(Yarkshire Local Section).—Wednesday, February 24th. At 7 p.m. At Philesophical Hall, Leeds. Paper on "Electricity Applied to Mining," by Mr. C. P. Sparks.

Physical Society of Lendon.—Friday, February 26th. At 5 p.m. At Imperial College of Science, South Kensington. Papers on "Magnetic 'Character' Figures, Antarctic and International," by Dr. C. Chree, F.B.S.; "The Electrification of Surfaces as Affected by Heat," by Dr. P. E. Shaw: "Electromagnetic Inertia and Atomic Weight," by Prof. J. W. Nicholson.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, February 26th. At 7.20 pm. At Bolbec Hall, Newcastle-upon-Tyne. February 26th. A General Meeting.

(Graduates' Association.)—Saturday, February 27th. At 7.15 p Paper on "Electric Lighting and Power for Ships," by Mr. O. Holmes,

NOTES.

The Electric Vehicle Committee.—At the last meeting of this Committee it was reported that the sales of the first number of "The Electric Vehicle" showed a considerable increase over the number given at the previous meeting, and it was decided to increase the size of the second issue. The sales of publicity mail cards published by the Committee show a considerable increase since the last meeting.

It was decided to offer, through the Commercial Motor Users' Association, prizes aggregating £10, to be awarded to electric vehicle drivers in the examinations for drivers which the Associa-

An offer by the Commercial Motor Users' Association to provide space in the next edition of its "Handbook of Night Shelter Accommodation for Commercial Vehicles," for particulars of electric vehicle charging stations and a map, conditional upon the Electric Vehicle Committee preparing the matter to be inserted,

was accepted. About 25 of the illuminated and 46 of the enamel plate charging station signs will be required by the various undertakings, and the Secretary is to get in offers and to appoint for one year, in con-nection with each sort of sign, a maker as the official manufacturer and to notify the name. In each case, in the forthcoming issue of "The Electric Vehicle."

An intimation was received from the Car and General Insurance Corporation, Ltd., that it had in preparation a special prospectus

for electric vehicles.

A communication was submitted from the Secretary of the IM.E.A., requesting the Electric Vehicle Committee to prepare a report on "The Use of Electric Vehicles in Municipal Service," for discussion on June 17th next, one of the two days fixed for the Annual Business Meeting of the I.M.E.A., and asking the Committee to arrange for a parade and demonstration of electric vehicles to follow upon the reading and discussion of the report. It was agreed that the Committee should comply with this request. As to proposed standardisation of glow lamps for electric vehicles.

As to proposed standardisation of glow lamps for electric vehicles, the Technical Sub-Committee held a joint meeting with a Sub-Committee appointed by the Tungsten Lamp Association, but a stage was not reached at which any report could be formulated.

The Relation of Supply Prices to Profits. The Relation of Supply Prices to Profits.—The price movements in connection with the production and disposal of electrical energy in Germany for a number of years past form the subject of a work which was recently published by Gustav Siegel, at Munich. It is shown, in the first place, that the number of kw.-hours sold by the electricity supply works increased from 1,200,000,000 in 1900 to 11,300,000,000 kw.-hours in 1913, or from 21'4 kw.-hours per head of the population, to 169 kw.-hours in the same years respectively. The latter circumstance indicates the large and constant reduction in the sale prices is of decisive importance to the country from an economic point of view. Apart importance to the country from an economic point of view. Apart from the considerable direct saving which has been effected by consumers through the operation of lower charges for supply, the consumers through the operation of lower charges for supply, the steady fall in the average sale prices is found to have been of great significance to the supply works themselves, the remunerativeness of which has by no means been diminished by the concessions made in the prices. The difference between the works' costs and the average sale prices per kw.-hour becomes smaller year by year, or, in other words, the gross surplus per kw.-hour decreases as sale prices in general fall to a greater extent than the works' costs recede. Under these circumstances the surplus of the works would have reduced were it not for an expansion taking place in the turn. be reduced were it not for an expansion taking place in the turn-over simultaneously with the better utilisation of the generating plant. If the case of the Nuremberg supply works is taken as an plant. If the case of the Nuremberg supply works is taken as an example and applied to all the electricity works, Mr. Siegel shows that while the average gross surplus per kw.-hour has diminished from 2.63d. to 2.31d. between 1900 and 1912, the gross surplus has risen in percentage of the capital invested from 14.48 to 20.06 per cent. in the same years respectively. In support of the contention that price reductions exercise a favourable effect upon the dividends of company-owned works as a result of the expansion in the business, reference is made to nine undertakings or groups of undertakings, each of which owns a number of works and which indicate a progressive dividend increase in a period extending over a number of years. It is submitted, further, that the company works, in contradistinction to those in the possession of local authorities, in general charge lower prices than the latter, and this fact is attributed to the circumstance that under private this fact is attributed to the circumstance that under private enterprise great importance is attached to the supply of energy for power purposes and the price policy is arranged accordingly.

Canada and the Exportation of Electrical Energy. Holding that the interests of Canada are paramount, and that whenever the Canadians feel that they can use to advantage the energy now generated for export they can, and no doubt will, cancel the licences permitting its export into the United States,

the Privy Council of the Dominion of Canada has declared that a contract to export electrical energy from Canada to the United States may be revoked at any time. As is well known, the Dominion Government grants licences yearly to certain electrical corporations of Canada near the border to expert electricity into the United States.

All of the large generating systems at the Niagara frontier line and when the Canadian-American Power Co. applied to the Public Service Commission, Second District, New York, about a year ago, for the right to issue stock on a contract made with the Electrical Development Co., of Ontario, for a large block of electricity to be need in the United States, there was a sharp difference of to be used in the United States, there was a sharp difference of opinion between the Commissioners as to whether the companies should be allowed to capitalise the contract. Commissioner M. S. Decker granted the right of the company to capitalise the contract

Commissioner Decker's discussion at the time on the vearly licences from the Dominion Government is of interest now, in view

of the decision of the Privy Council. Mr. Decker wrote:

"The formality of securing a licence yearly from the Dominion
Government is required by the Dominion law, but such licence has
been granted yearly to the great producing electrical corporations
of Canada, and no reason appears for apprehension that any disof Canada, and no reason appears for apprehension that any discrimination will be made against the Electrical Development Co. or the Toronto Power Co. lessees. We have nothing before us but the suggestion that the Dominion of Canada may at some future time forbid this exportation. The Commission must assume that international relations affecting so important a subject as the means of continuing great industries which have grown up in reliance upon the use of this imported power, and, as well, the interests of the Canadian producing companies, thus have become fixed, and subject only to such changes as will protect the great commercial and industrial interests and rights now served by this power brought from Canada. The time has long since passed when Governments proceed ruthlessly, from purely national rashness or anger, to destroy the settled, accepted commercial relations and formal vested rights of business corporations. . . . Without going into details, it seems sufficient to say that the prohibition of going into details, it seems sufficient to say that the prohibition of exportation from Canada of this present electric power which now comes into this country, would paralyse business and industries of many kinds, and would deprive numerous localities of electricity for light."—Electrical World.

Parliamentary.—Standing Orders.—The whole of the Bills promoted for this year's Session have now been before the Examiners for proof of compliance with Standing Orders. Amongst those which have failed to prove compliance are the Stalybridge, Hyde. Mossley and Dukinfield Tramways and Electricity Board, the Dunfermline and District Tramways, the London County Council Tramways and Improvements, and the Aberdare Urban District Council's Tramways. These have been referred to the Standing Orders Committee, who will decide whether they shall be allowed to proceed.

London Electric Supply.—Now that the London County Council has decided not to go forward with its Electricity Bill for consolidating the electrical interests of London, the field is left to the solidating the electrical interests of London, the field is left to the promoters of the London Electric Supply Bill, who will, however, be vigorously opposed. Notice of opposition has been given by no fewer than 42 petitioners, amongst whom are the London County Council, the Borough Councils of Fulham, St. Marylebone, St. Pancras. Shoreditch, Woolwich, Finsbury, Southwark, Bermondsey, Hackney, Camberwell, Hammersmith, Hampstead and Lambeth; the Corporation of London, Croydon, Esling, and West Ham; and a number of Urban District Councils, including Penge, Twickenham, Chiswick, Isleworth, and Slough; and the County of London Electric Supply Corporation, Egham and Staines Electricity Co., and the City of London Electric Lighting Co.; the principal electrical engineers of local authorities supplying electricity whose undertakings might be acquired under Clause 61 of the Bill; and the chief assistant electrical engineers of local authorities supplying electricity whose electrical engineers of local authorities supplying electricity whose undertakings might be acquired.

Opposition to Private Bills.—Most of the petitions against the Private Bills which will originate in the House of Commons this Session have now been deposited in the Private Bill Office. Nine petitions are deposited against the Metropolitan District Railway Bill, including one from the L.C.C. and one from the Metropolitan Railway Co. There are six against the Rhondda U.D.C. (Tramway

Industrial Electric Heating. -A. K. Young, newbusiness manager of the Toledo Railways and Light Co. is deeply impressed with the possibilities of industrial electric heating from the standpoint of the central station, and believes that there is a the standpoint of the central station, and believes that there is a dire lack of authentic data available on the subject. To remedy this situation Mr. Young recently recommended the establishment of an industrial heating association, the chief purpose of which would be the collection and compilation of data on the subject. This matter was proposed at the recent conference of the Committee on New Business Co-Operation of the Ohio Electric Light Association, held in Cleveland, and it was decided to call a preliminary organisation meeting in Dayton, O., on March 16th.— Electrical Review and Western Electrician.

Fatalities.—Manchester.—John Harvie Nevin, 38, electrical engineer, was the victim of a fatal accident at the Stuart Street generating station, Manchester, on February 12th. At the inquest held on Monday it transpired that Nevin, who had

been employed at the works for six months, and had had 12 years'

experience altogether, received a shock whilst attending to the hightension gear. Thomas Baxendale, assistant resident engineer at Stuart Street, said Nevin had been instructed to attend to the transformers, and had performed that duty satisfactorily. Then he appeared to have gone to the high-tension switchboard for some reason which nave gone to the high-tension switchboard for some reason which the witness could not explain. Instead of making the cubicle, which he had apparently examined, quite safe by earthing the switchgear, he appeared to have taken a great risk without reason, thereby breaking the rules. Witness explained that for dangerous tasks of that kind rubber gloves, galoshes, and an insulated stick were provided, but Nevin had not used these. There was a very high voltage, and he must have received a very severe shock which caused him to fall from a ladder on which he had to stand to reach the onlice. After the accident he was he had to stand to reach the cubicle. After the accident he was put in a special respiratory machine for two hours, and ether was also administered, but without avail. Mr. Baxendale added that he was afraid there had been a little mental aberration on Nevin's part. The jury returned a verdict of "Accidental Death."

Tram-Conductor's Fraud.—At the Bradford City Tram-Conductor's Fraud.—At the Bradford City Police Court last week, a tram conductor named Herbert K. Smith (28), of 44, Royd Street, Bradford, was sent to prison for three months on a charge of stealing a tin box containing a bell punch and a number of tramway tickets, value £3, the property of the Bradford Corporation. According to the statements of Mr. J. G. Gunter, who prosecuted, a quantity of unused tramway tickets were sent to the Bowling Depôt on November 5th, and were missed the next day. There could not be transported. were sent to the Bowling Depot on November 5th, and were missed the next day. They could not be traced until the tramways manager (Mr. C. J. Spencer) noticed an alteration on a way-bill which had been used by the prisoner. Afterwards it was found that 16 other way-bills had been altered, and the number of tickets stolen was 2,917. The tramway manager described the fraud as the most ingenious he had come across in the course of his experience.

European supplies for January Copper.tabulated on Messrs. Merton's statistical circular, are 307 tons less than at the end of December. English stocks show a decrease of 2,757 tons from December 31st to January 30th, the difference in the European stocks being made up by larger incoming shipments. Detailed supplies show a large increase in arrivals from North America, and an unusually strong supply from Spain and Portugal. Ohile shipments are even better than for Docember, 1914, and considerably exceed the monthly average for 1913. Australian shipments were not so heavy during January. The large increase shipments were not so heavy during January. The large increase in demand received a better response from deliveries last month, as is shown by the total deliveries, which exceed those for December by 4,101 tons.

Electric Vehicle Demonstrations,-Messrs. Drake AND GOBHAM, LTD., of 47, Spring Gardens, Manchester, are conducting an energetic campaign towards popularising the use of electric vans in Lancashire and chesbire, for which counties they have acquired the sole agency for vehicles with the Edison battery and to that end have acquired a 2-ton demonstration van, which we illustrate herewith. This webicle is of rebust construction the illustrate herewith. This vehicle is of robust construction, the body being so arranged that it can be used as a covered van, open wagon or flat lorry.

The Edison battery is carried in a cradle below the body, and the motor is of the totally-enclosed traction type, driving through a differential gear to a lay shaft, and thence by roller chains to

the rear wheels. The electric truck excels as a vehicle for heavy haulage, and there is no doubt that in the manufacturing area in which Messrs, Drake & Gorham are now endeavouring to introduce the electric vehicle, there exists great scope for its employment, apart altogether from its uses in connection with the retail trades.

Mails to the Far East. — Prof. C. A. Middleton Mails to the Far East. — Prof. C. A. Middleton Smith, writing under date January 11th from the University of Hong-Kong, says:—"Owing to the war the mail services to the Far East have been very much interrupted, and in some cases correspondence has gone entirely astray or has been lost at sea. I should be very glad if any of your readers who may have sent letters out here, and have had no reply after a reasonable lapse of time, would kindly send copies or communicate again. It may also he of adventage to inform correspondents who send to this time, would kindly send copies or communicate again. It may also be of advantage to inform correspondents who send to this colony that the mails now often take six weeks instead of the 17 days in the anti-war days. It is, of course, always an advantage to send duplicate letters by the following mail."

Professional Classes and the War.—On Tuesday last a meeting was held under the chairmanship of the Lord Mayor of London, who was supported by many distinguished persons, to promote the aims of the "Professional Classes War Relief Council." This body, to whose programme we have previously referred, has been formed to ascertain the amount of distress in the professional classes due to the way and to overnies series of the professions. classes due to the war, and to organise assistance for necessitous cases, by providing temporary employment, hospitality, education for children, and maternity assistance. As the Archbishop of Canterbury pointed out in the course of a speech, very many members of the professional classes have been hard hit by the war, and are without the scope of the ordinary relief organisations; in many cases projected public works have been deferred until after the war, and the men thus thrown out of employment find it exceedingly difficult to obtain other means of livelihood. Sir J. McClure explained the methods adopted, which were partly based on the principle that the prosperous should help the unlucky ones. The the principle that the prosperous should help the unlucky ones. The matter was a delicate one, as relief must be given without wounding the self-respect of the recipient, and for this reason doles of money were avoided. On the other hand, work was not made; openings were sought in which the training and ability of the men could be usefully employed. Help could be given by loans, and the Council would be glad to receive money on loan for this purpose. The sympathetic attitude of the schools, many of which were accepting children at reduced fees, had greatly assisted the Council. It was important to remember that the need of assistance would continue after the war had ended.

Help is asked for in the shape of offers of employment, and of funds, which should be sent to the treasurer, 13 and 14, Prince's Gate, S.W.

funds, whi Gate, S.W.

Petrograd Electricity: Proposed Monopoly.-A Committee appointed to study the relations of the Petrograd Town Council with the electrical companies, came to the conclusion that Committee appointed to study the relations of the Petrograd Town Council with the electrical companies, came to the conclusion that the Petrograd municipality should concentrate the city's electrical equipment in its own hands, either by constructing its own central station and extending the cable system along the streets of the city, or by buying up the existing electrical concerns. One member of the Committee—M. P. Phedoroff—suggested the reconstructing of existing companies and modifications in the terms of their concessions. Such steps required a previous decision on the system to be adopted in the future for supplying Petrograd with electricity; that is, whether by municipalisation or private concession. One expert—V. I. Zazarsky—calculates the net profit to the city by buying out existing concerns, at several million roubles per annum, beginning with 1917; whilst another expert—A. L. Wolf—calculates that the profits from the year 1920, assuming that the present tariff for power will be reduced from 33 copecks to 15 copecks per kw.-hour, will be about 2,500,000 roubles a year more than is at present obtained as the town's share of the existing companies' profits. As these are considered reliable estimates, it is looked upon as safe that the city will make a profit out of the venture. According to the report of the Committee, the consumption of power for private use increased between 1904 and 1913 from 16,383,000 to 43,538,000 kw.-hours, or at the rate of 16.5 per cent. per annum; for industrial purposes the increase registered during the period named was from 12,433,000 to 42,123,000 kw.-hours, or 24.7 per cent. per annum. [1 rouble = 2e. 1\frac{1}{2}d.; 1 copeck = 1 farthing.]

Institution and Lecture Notes.—Royal Society of -The following evening lecture arrangements are announced up to the end of March :-

Prof. Vivian B. Lewes, lectures on "Motor Fuels." Mondays, February 22nd and March 1st.
Prof. W. J. Ashley, "Economics of the War." Wednesday, February 24th.
Prof. J. W. Gordon, "Patent Law Reform and the War." Wednesday, March 10th.
Mr. H. M. Thornton, "Industrial Uses of Coal Gas." Wednesday, March 17th.

Igranic Engineering Society.—A course of three lectures on "Ancient Engineering in Peace and War" was recently delivered by Mr. R. P. Howgrave-Graham, M.I.E.E., at Bedford. The arrangements were made by the Society, and resulted in raising a substantial sum in aid of the Prince of Wales's and Belgian Relief

Patents and Alien Enemies.—Licences have been granted by the Board of Trade to Messre. Bi-Metals, Ltd., in respect of patents No. 13,557/03 (Callmann) and No. 17,624/04 (Leisel).

Inquiry.—Makers of papier-maché bobbins are asked

Appointments Vacant.—Assistant electrical engineer Appointmentation of the Assistant Clear Charles and Line telegraphists, for Divisional Signal Company, Royal Engineers (Reading), new Regular Army; junior assistant electrical engineers, over 19 years of age (15s.), for Newcastle-upon-Tyne Electric Supply Co.; overhead lineaman for car-shed repairs, for Burton-upon-Trent Tramways. Particulars are given in our advertisement pages.

Miners' Dispute.—Last week's conferences at Leeds resulted in the settlement of the Yorkshire miners' dispute, the men's demands being agreed to for the duration of the war.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials .- At the Islington electricity works last Friday MR. JARRATT (the assistant mains engineer) was presented with a music cabinet to contain automatic music rolls, on his leaving to take up the post of mains superintendent at the Swansea Borough Council electricity works, under Mr. Burr. The presentation was made by Mr. MacAlister, the chief assistant, on behalf of Mr. Gay, who sent an apology for his absence, Mr. MacAlister referred to the satisfaction that Mr. Jarratt had always given in the testing department and the mains department. Mr. Marks, the present testing engineer, who is serving with the Forces, has been appointed to the poet vacated by Mr. Jarratt (subject to the Council's decision), at the conclusion of the war. Mr. Bradshaw (mains superintendent) endorsed very heartly all Mr. MacAlister's expressions in regard to Mr. Jarratt. Mr. Jarratt feelingly responded, and said that although it seemed very nice to leave and take up a new post, when it came to the point it was like city works last Friday MR. JARRATT (the assistant mains engineer) leave and take up a new post, when it came to the point it was like turning away from home.

The Greenock Corporation Electricity Committee has unanimously recommended the appointment of Mr. W. B. SMITH, A.M.I.E.E., as chief assistant engineer of the electrical undertaking, consequent upon the appointment of Mr. J. H. Parker as chief assistant at Oroydon. Mr. Parker has been granted an honorarium of £25 for his services as interim manager of the Greenock works

before the new chief took up his duties.

MR. A. C. GLOVER has been appointed to a position on the staff of the Cornwall Electric Power Co., and commences his duties on

1st prox.

Mr. V. A. WOODLAND has resigned his position as chief meter inspector to the Watford U.D.C., and has taken a position as meter inspector.

The material Corporation Electricity Department. tester, &c., at the Hampstead Corporation Electricity Department.

General.—Mr. Oscar Moll, director of the German Atlantic Cable Co. at Cologne, Germany, retired from the service at the end of 1914, after 46 years of successful work in cable telegraphy. He was born at Berlin, in 1850, and, in 1867, he joined graphy. He was born at Berlin, in 1850, and, in 1867, he joined the Electric and International Telegraph Co. of London, and, two years later, the Indo and European Telegraph Co. as clerk-in-charge of the London station. On the formation of the Direct United States Cable Co. in 1874, Mr. Moll occupied the position of assistant to the manager, and became manager in 1888. In 1889 he undertook the management of the Deutsch-Atlantische Telegraphengesellschaft of Cologne. For the last 15 years Mr. Moll has been director of the company and his broad knowledge of ashle matters and his great shillties contributed considerably. of cable matters, and his great abilities, contributed considerably to the rapid development of this concern. Mr. Moll took part in the International Telegraph Conferences at Budapest, for the Direct United States Cable Co., and at London and Lisbon for the Deutsch-Atlantische Telegraphengesellschaft. — Telegraph and

Telephone Age.

MR. A. HATTON, electrical engineer on Government work at Portamouth, was married at Southsea a few days ago to Miss Frances Boyle, of High Lea, New Mills.

The staff of the Burton and Ashby-de-la-Zouch Light Railway Co. have presented a rosewood inlaid drawing-room clock to Mr. W. J. McDonald, traffic superintendent, who is leaving for Wakefield. His successor is Mr. W. Barton.

Obituary.-Mr. Edward Chapman, a member of the Crewe Town Council, and chairman of the Electric Light Committee, died on February 12th.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Burnham and District Electric Supply Co., Ltd.—Deb. dated February 8rd, 1915, to secure £1,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: Lloyds Bank, Ltd., 71, Lombard Street, E.C.

Torquay Electric Light and Power Co., Ltd.—Particulars of £1,000 second deb. created February 8th, 1915, filed pursuant to Sec. 93 (8) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncealed capital. No trustees.

Bourton-on-the-Water Electric Light and Power Co., Ltd.

-Morgage dated February 5th, 1915, to secure £800, charged on certain lands and premises at Bourton-on-the-Water, Glos. Holders: Cheltenham and Gloucestershire Permanent Mutual Benefit Building Society, 18, Clarence Street, Cheltenham.

Walsall Electrical Co., Ltd. (37,696).—Capital, £20,620 in £1 shares: return dated December 25th, 1914; 12,000 shares taken up; £10,000 paid; £2,000 considered as paid. Mortgages and charges: £9,000.

Railless Electric Traction Co., Ltd. (98 728).—Capital, 25,000 in 4,750 ord. shares of 21 each and 5,000 def. shares of 1e. each. Return dated January 14th, 1915; 2,571 ord. and 5,000 def. shares taken up; £1 per share called up on 2 056 ord. shares; £1,916 paid, leaving £140 in arrears; £765 considered as paid, being £1 per share on 5,000 def. shares. Mortgages and charges, nil.

United Electric Car Co., Ltd. (57,082).—Capital. £300.000 in £1 shares (£150,000 pref.) Return dated Reptember 30th, 1914; 150,000 ord. and 103,000 pref. shares taken up; £250,000 paid. Mortgages and charges, nil.

CITY NOTES.

Central London Railway Co.

THE report submitted at the annual meeting held yesterday gave the following results for the year ended December, 1914:

		Decrease compared with 1913.
Gross receipts of railway, etc Expenditure	£244,691 144,359	£10,146 3,183
Miscellaneous receipts, (net) from	£100,332	£6,963
rents, interest, etc	32,685	3,578
Total net income Add balance from last account	£133,017 20,879	£10,541 6,340
Deduct interest, rentals and other fixed charges	£153,896 38,133	£16,881
citate P.C.	£115,763	£16,716
Deduct dividend on 41 per cent. preference stock	21,600	_
Balance available for dividend on ordinary, preferred ordinary and de-	604.100	614.514
ferred ordinary stocks	£94,163	£16,716

After paying the dividends reported in our last issue, £15,413 is to be carried forward. The capital expenditure amounted to £52,099. The decrease in the traffic receipts is mainly attributable to the war conditions. Owing to the war the work in connection with the extension railway between Wood Lane and Ealing Broadway has not progressed very rapidly, and the date of completion will therefore be deleved. and the date of completion will therefore be delayed.

The company's Bill, which sought powers to construct four subways, the installation of escalators at Shepherds Bush, Oxford Circus and the Bank, and the enlargement of tunnels at Holborn, received Royal Assent last July, as did also the London Electric Railway Bill. The company has a Bill now before Parliament to make further provision respecting the capital and undertaking of the Metropolitan District Railway Co. to confer further powers on the London and South-Western Railway Co. in respect of their Wimbledon and Fulham Railway, and on the Wimbledon and Sutton Railway Co. and for other purposes.

City & South London Railway Co.

The annual meeting was held on Tuesday at the Westminster Palace Hotel. The report submitted contained the following results for the year ended December, 1914:-

-			Inc. or Dec.
	1914.		with 1913.
Gross receipts of railway, etc	£136,844	-	£9,759
Expenditure	93,967	+	3,054
Miscellaneous receipts (net) from	£42,877	-	£12,813
rents, etc	9,073	+	698
Total net income	£51,950	_	£12,115
Add balance from last account	738	-	1,850
Deduct interest, rentals and other	£52,688	-	£13,965
fixed charges	28,321	_	630
Dividends	£24,367	-	£13,335
Dividends on preference stocks £30,000			
Less chargeable to capital under provisions of Act			
of 1913 <u>5,633</u>	24,367	-	10,747
Balance available for dividend on consolidated ordinary stock		_	£2,588
			-

The interim dividends, which in July, 1914, were declared upon all four of the company's preference stocks, absorbed £21,250. The balance estimated as available for dividend for the six months to June 30th, 1914, not having in fact provided that sum, it was to the extent of £5.633 provided out of capital. In view of the necessary uncertainty of the duration of the war, the directors think it undesirable that any further appropriation of capital under that enactment should for the present be made. The balance available for dividend for the second half of 1914 amounts to £8,750, which it is proposed to apply in payment of a half-year's dividend on the preference stocks of 1891 and 1896. The capital expenditure during the year was £24,767. Under the terms of an agreement dated April 28th, 1914, £412,000 four per cent, debenture stock was April 28th, 1914, £412,000 four per cent, debenture stock was

allotted and issued to the Underground Co. It was proposed allotted and issued to the Underground Co. It was proposed to utilise the proceeds from the sale of this stock towards the various improvements on the railway; but in consequence of the outbreak of war, the directors, notwithstanding the fact that their financial and other preparations for beginning the enlargement of the tunnels and the other great improvements contemplated by the company's Act of 1913 had been completed, and the necessary arrangements made with the contractors did not feel justified in preceding with the works. tractors, did not feel justified in proceeding with the works.

Mr. C. B. Stuart Wortley, K.C., M.P., presided at the meeting on Tuesday. He said that but for the war they would now have been well forward with the reconstruction of the railway. They would have been within twelve months of finding themselves the owners of an improved railway and new and larger rolling stock. When the war came they had actually passed their plans and drawings, made arrangements with contractors, and raised a portion of the money. Perhaps it was as well that at that moment no contractors' men had as yet been set at work, for in that case they would now have been committed to going continuously forward with difficult underground works in spite of greatly enhanced rates for labour and materials. The war had also had its effect on their traffics and accounts. During the mobilisation in August they carried soldiers and sailors free, and ever since the beginning of the war all pleasure traffic, and most of the evening traffic, had greatly fallen off. At the same time the adverse influences continued which had already told so heavily upon their earnings in previous years, and which were accepted by Parliament in 1913 as sufficient ground for permitting the fundamental changes by which it was hoped to counteract them. The result on the receipts side was that the gross railway earnings were down by £9,760. There were, however, some grounds for hoping that this decrease would not continue to be progressive, for of late there had been a distinct revival in the weekly traffics. Since the beginning of the year traffic increases set in which, up to the last completed week of 1915, showed an improvement, as against the corresponding weeks of 1913 and 1914, of £350 per week on an average. It remained to be seen whether this improvement was due to temporary causes, such 1914, of £350 per week on an average. It remained to be seen whether this improvement was due to temporary causes, such as the removal of 'buses from the streets for service in the war. as the removal of 'buses from the streets for service in the war. Should it, however, continue for any great part of the new year, it would work a most welcome improvement on their accounts for 1915. On the expenditure side there was an increase of £3,054. This time the increase could not be attributed to higher prices of coal, which, indeed, were slightly lower; but there were substantial increases for men's wages, amounting to no less than £4,000. The number of City and South London Railway men on the pay roll who had rejoined the colours or had volunteered for service was not easily separable from the total number of men who belonged to the staffs of the whole of their group of railways and were serving in the war. That total, however, was no less than 1,300 men, or 20 per cent, of the whole. The Chairman proceeded to refer to the arrangements made for, and allowances to, men with the colours. with the colours.

Admiral Sir Cyprian Bridge seconded the motion, which

was adopted.

London Electric Railway Co.

At the annual meeting held yesterday the following results for the year ended December, 1914, were submitted:—

•		1	Inc. or Dec.
Gross receipts of railways, etc Expenditure	£712,573 345,001		£2,746 12,145
	£367,572	_	£14,891
Miscellaneous receipts (net) from rents, interest, etc	69,372	+	10,371
Total net income \dots \dots \dots Add balance from last year's account	£436.944 1,086	_	£4,520 2,021
	£438,030		£6,541
Deduct interest, rentals and other fixed charges	233,236	+	17,977
Deduct appropriation to reserve	£204,794 8,000	-	£24,518
Deduct dividend on preference stock	£196,794 126,947	-	£24,518
Balance available for dividend on ordinary shares	£69,847	-	£24,518

After paying the dividends mentioned in our last issue, £8,000 After paying the dividends mentioned in our last issue, £8,001 is carried to reserve and £11.547 carried forward. £867,001 of 4 per cent, debenture stock has been issued during the year and the capital expenditure was £309,007. Passenger traffic was adversely affected by the conditions which prevailed during the last five months of the year and prevented any expansion in receipts for the year which should have resulted from the various extensions and improvements. The extension of the company's line at Charing Cross was completed and the company's line at Charing Cross was completed and

brought into operation in April last. The arrangements for the interchange of passengers between this company's sta-tions and the station of the Metropolitan District Railway Co. tions and the station of the Metropolitan District Kallway Co. at this point, where escalators have been installed, have been working very satisfactorily and are much appreciated by the travelling public. The escalators constructed at Oxford Circus station were placed in service in May last, and the opening of the new concourse booking hall at the basement level has very satisfactorily met the traffic requirements at this busy station. Escalators have also been constructed at Baker Street station, making a convenient means of interchange of passtation. Escalators have also been constructed at Baker Street station, making a convenient means of interchange of passengers with the Metropolitan Railway, and were placed in service in October last. Rapid progress was made with the extension from Paddington to Queen's Park and a portion was opened for public traffic on January 31st, 1915. The company has a Bill before Parliament, as mentioned in the Central London report above.

Metropolitan District Railway Co.

At the annual meeting held yesterday the directors reported that the normal course of the business of the company was that the normal course of the business of the company was necessarily disturbed by the outbreak of the European war. The control of the railway was taken over by the Government. The following is a summary of the receipts and expenditure on revenue account:—Receipts of railway, etc., £817,456, expenditure £413,970, miscellaneous receipts (net) from rents, interest, etc., £115,735; total net income £519,221, plus £12,659 brought forward. Deduct interest, rentals and other fixed charges £343,662, appropriation to reserve £20,000, dividends on guaranteed and first preference stocks £124,930, and there is a balance available for dividend on second preference stock amounting to £43,288. After providing for the dividends mentioned in our last issue, £13,888 is to be carried forward. The capital expenditure during the year amounted to £117,400. The extension of the London Electric Railway Co.'s line at Charing Cross was completed and brought into operation in April, 1914. The arrangements for the interchange of pas-April, 1914. The arrangements for the interchange of passengers between this company's station and the stations on the London Electric Railway at this point, have been working very satisfactorily and are much appreciated by the travelling public. The re-arrangement of the tracks at the Whitechapel station was completed and brought into use in October last.

London Electric Supply Corporation, Ltd.

The profit for the year ended December, 1914, is £93,234, against £71,753 last year. Adding £5,098 brought forward, less interest on temporary loan, £738, the total is £97,594. Deducting interest on debenture stock to December 31st, 1914, £19,494, and sinking fund for redemption of debenture stock in 1931, £12,000, there remains £66,100. The dividend on the 6 per cent. preference shares absorbs £26,952; a dividend of 4 per cent. on the ordinary shares requires £13,320; there is placed to contingencies account (making £11,000) £7,000, and to reserve account (making £87,500) £10,000, leaving £8,828 to carry forward. The sinking fund of £12,000 a year, cumulative; for the redemption of debenture stock in 1931, now amounts to £37,490, in addition to the fund, £23,118, invested to repay capital expenditure in Westminster and St. James' Companies districts, making a total of £60,608. Companies districts, making a total of £60,608.

"The supply has been efficiently maintained

"The supply has been efficiently maintained during the year. The number of units sold amounted to 46,343,055, as against 35,336,223 last year; the total costs per unit were 50d., as against 62d. last year. The power supplied for traction and tramway purposes shows 43 per cent. increase, while the power supplied for industrial purposes shows 23 per cent. increase, over last year. The average receipt per unit sold (lighting and power) was .94d., as compared with 1.04d. last year. Attention is directed to these figures in view of the repeated statements that London is suffering from the want of a cheap supply of electric power."

The plant and machinery have been maintained out of revenue and are in efficient condition. The directors have joined with the other electric supply companies in London in

joined with the other electric supply companies in London in depositing a Bill, entitled "The London Electric Supply (No. 2) Bill," in the present session of Parliament.

Annual meeting: February 25th.

Tyneside Tramways and Tramroads Co.

For the December half of 1914 the surplus of receipts over expenses is £6,185, plus £1,060 brought forward. After deducting interest on debentures, loans, etc. (£1,004), there remains an available balance of £6,241. Dividend on the preference shares (5 per cent. per annum) absorbs £601; a dividend on the ordinary shares at the rate of 3 per cent. per annum requires £2,008; there is placed to reserve for renewals, depreciation and other contingencies (plus £237 interest on investments, and making the fund £19,163) £1,400; to a special reserve account to meet contingencies £1,500, carrying forward reserve account to meet contingencies £1,500, carrying forward £732. The ordinary share dividend for the whole year is an increase of 1 per cent. over 1913. Traffic receipts show an increase of £2,263 as compared with the corresponding halfyear of 1913, but for the whole year there is an increase of £3,249.

,====			1912.		1913.		1914.
Car miles			717,567	•••		•••	724,097
Passengers carried	•••			•••		••	6,749,161 €31,819
Total traffic receipts	•••	•••	£26,888	•••	~ ~ ~ ~ ~	•••	£,31,613
Gross profit	•••	• • •	£9,456	• • •	2,3,130	٠.	2,12,000

Mr. J. T. Merz, who presided at the meeting on the 9th instant, said that of the increased traffic £2,488 was for ordinary, £537 for holiday, and £224 for workmen's traffic. The receipts per car mile averaged 10.54d. as against 9.52d. in 1913, and the cost per car mile 6.72d. as against 6.39d. That showed that the cars were carrying more passengers, and the cost was one of the lowest among the tramways of the country. The average for 77 tramways was 7.25d., while their's was only 6.72d.; that figure was even more reasonable when it was remembered that most of the other tramways produced their own current and they did not. The reserve fund now stood at £19,163. Their aim was always to keep £20,000 to meet repairs to rolling stock and permanent way. Of their reserve, only £14,000 was at once available, as the other £5,000 had been spent on the line as capital. Their profit was 1½ per cent. more than in the previous year, but it was not proposed to increase the dividend beyond ½ per cent. They proposed to increase the dividend beyond ½ per cent. They proposed to put £1,500 to a special reserve. They had had some exceptional demands in consequence of the war, and proposed to vote a sum not exceeding £200 for charitable nurposes connected with the war during the next half-year. During the past half-year they had spent £85 for similar purnoses. Much of this had gone towards the maintenance of the families and dependents of those of their men who had gone to the war. As to the future, he could say nothing excent that they had been very busy as the result of the activity in the engineering and shipbuilding yards.

A shareholder asked whether the trams had been overloaded; and, further, whether, in view of the rise in the price of commodities, they would be likely to be called upon to increase the wages of the tramwaymen.

The Secretarry (Mr. J. C. Little) said the cars were only

price of commodities, they would be likely to be called upon to increase the wages of the tramwaymen.

The Secretary (Mr. J. C. Little) said the cars were only overloaded for one iourney during the "rush."

The CHAIRMAN said they had a demand—he thought a reasonable one—in regard to wages, and the directors had authorised, or were going to authorise, the staff to arrange the matter. The workmen and staff had worked harder than usual, and had done it cheerfully and well. As to the increase in the cost of living to the workmen, that was a special matter. in the cost of living to the workmen, that was a special matter, and the staff was to be authorised to arrange with the workmen as to a reasonable advance.

The report was adopted.

Mersey Railway Co.

The train mileage run during the year ended December, 1914, was 548,697 miles as compared with 547,784 for the previous twelve months. As the control of the system in common with other railways has been taken over by the Government, the

other railways has been taken over by the Government, the accounts for the year take a special form.

Under the scheme of arrangement scheduled to the Mersey Railway Act. 1900, as extended by the Mersey Railway Acts. 1906 and 1910, the payment of interest on the following debentures stocks, viz.: 1866, 1871, 1882/3/5 and B, is contingent on the revenue of the company available therefor in each separate year. The auditors have certified that the revenue available for this purpose for the vear amounts to £21.279, as compared with £20,202, and this amount is accordingly being distributed to the debenture holders as follows:—Interest at 4 per cent. on the 1806 debenture stock £4.664, at 3 per cent. on the 1871 debenture stock £3,000, at 3 per cent. on the 1882/3/5 debenture stock £10,800, and 1 per cent. on the "B" debenture stock £2.814; balance carried forward £1.

Annual meeting February 19th. Annual meeting February 19th.

City of Buenos Ayres Tramways Co. (1904), Ltd.

City of Buenos Ayres Tramways Co. (1904), Ltd.

The annual meeting was held on Monday at Winchester House, E.C., under the presidency of Mr. John Heaton. In proposing the adoption of the report (Elec. Rev., p. 225); the Chairman said he had to inform them that the annuity from the Anglo-Argentine Tramways Co., Ltd., had been duly received. Three quarterly interim dividends had been paid, and they would declare the final dividend that day of 1s. 3d., making the 5s. per annum. In addition, they proposed to add £5,200 to the general amortization fund, raising that fund to £37,146. With regard to the amortization funds, the auditors reported: "In our opinion, the position of both funds is quite satisfactory, and the purpose for which they were instituted has, up to the present, been more than fulfilled." It was a source of satisfaction to the board to receive such favourable reports in that connection from year to year. The deplorable war now raging in Europe and the climatic conditions existing in the Argentine connection from year to year. The deplorable war now raging in Europe and the climatic conditions existing in the Argentine in Europe and the climatic conditions existing in the Argentine Republic had been adverse to both railway and general business, but he was glad to say it had not affected them in any way. The board were glad to be able to present such a satisfactory report, and they hoped and anticipated the same good fortune for the future.

Mr. E. H. Woods seconded the motion, and the report was adonted

Cambridge Electric Supply Co., Ltd.

DURING the year 1914 there were 183 additional consumers connected, and the number of units supplied was 1,011,835, an increase of 81,281 units. There was a total profit for the year of £11,585, plus £1,199 brought forward. After deducting debenture and other interest £1,816, and placing £3,000 to depreciation fund account, there remains £7,968. An interim dividend of 2½ per cent., absorbing £2,209, has been paid, and the directors recommend the payment of a further dividend of 3½ per cent., making 6 per cent. for the year, absorbing £3,112, leaving to carry forward £2,647. The directors have thought it wise to increase considerably the carry forward in view of it wise to increase considerably the carry forward, in view of possible emergencies due to the war.

Annual meeting, February 24th.

Northampton Electric Light & Power Co., Ltd.

The development of the business during 1914 was in all respects satisfactory. Lamps and motors added (32 Watt lamp basis) were 32,883, making a total equal to 191,781 lamps. The basis) were 32,883, making a total equal to 191,781 lamps. The increase in H.P. of motors is 894, making 3,935 H.P. The output has been 3,958,700 units, compared with 3,568,981. The maximum winter load was 2,433 kw., an increase of 15½ per cent. The generating plant has been increased, and new buildings for additional offices have been erected. The general depreciation account has been increased by £6,000 (out of which certain specific items have been written down), £425 has been written off motors, and £1,750 added to reserve. £787 will be required for the dividend on the 5 per cent. preference shares, and 8 per cent. per annum is to be plaid on the ordinary shares for the half-year (making 6½ per cent. for the year) £3,140, leaving £3,041 to be carried forward.

Annual meeting, February 25th.

Bristol Tramways and Carriage Co., Ltd.

THE gross receipts for 1914 were £454,774, and the working and general expenses and renewals £372,185, leaving a net revenue of £82,589. After paying debenture interest, 4 per cent. preference interest, and interim dividend of 4 per cent. on the ordinary, it is proposed to pay a final dividend for the half-year at the rate of 5 per cent. per annum (subject to income tax), making 44 per cent. for the year, adding to reserve fund for contingencies and renewals £8,301.

The interest on investments has been carried direct to the

The interest on investments has been carried direct to the credit of the reserve fund. With the addition of £8,301 now proposed, the reserve fund will amount to £260,010. The receipts from the trainway department show a decrease of £4,035, or 1.65 per cent., whilst those of the carriage department have increased by £34,811, or 19.92 per cent. Passengers carried on the cars and motor omnibuses were 58,301,585, as compared with 56,790,309 in 1913, an increase of 1,511,276.

with 56,790,309 in 1913, an increase of 1,511,276.

The operation of motor omnibuses in Bristol has been further developed. Three of the existing routes have been extended, and on three additional routes new services have been inaugurated. New services have been commenced between Gloucester and Tewkesbury and between Weston-super-Mare and Worle. The opening of further routes in Bristol and elsewhere in the near ruture is contemplated. In order to cope with the continued expansion of the business of the carriage department, additional rolling stock has been put into service, and in addition to other extensions and alterations of premises, the Bath and Cheltenham garages have been considerably enlarged, and a commodious depot and garage is in course of erection at Avonmouth so as to provide for the rapidly growing requirements in that locality for motor omnibuses, cabs and commercial vehicles. The Motor Constructional Works at Brislington, since the outbreak of war, have been chiefly devoted to the execution of work for the Government. Seven hundred and eighteen men in the company's employment have joined His Majesty's forces.

The Bill promoted by the Corporation last session was amended, and if the Corporation now elect to purchase they must acquire the whole of the company's ramways and light railway undertakings both within and outside the city. Under the terms imposed by Parliament, the portions on which the Corporation have no immediate option (about one-sixth of the company's system) must be purchased with due allowance for computed profits over various periods, the period for the larger portion being 32 years from the present ment. It is proposed to extend the Memorandum of Association to include the execution of Government and other contracts and the addition of new departments embracing the manufacture of aircraft, war material, the supply of electricity, and other matters.

Annual meeting, February 22nd.

Liverpool Overhead Railway Co.

For the year 1914, the gross revenue receipts (including estimated amount receivable under agreement with the Government) were £91,668, and the working expenses, including appropriation to reserve funds, £61,245, leaving £30,424.

Passengers carried— First class	1913. 1,456,694		1914. 1.527. 6 36
Third class (including tramways) Workmen (special return tickets)	7.517.715		7.745 356
Total	13.183,321	• • • • • • • • • • • • • • • • • • • •	13.361.944

After referring to the assumption of control by the Government in August, the directors state that, deducting from the above figure £30,425, the amount of debenture interest, £6,755, above figure £30,425, the amount of debenture interest, £6,755, and adding £6,275 brought forward, there is available for dividend £20,944, out of which interim dividends have been paid for the half-year ending 30th June last, at the rate of 5 per cent, per annum on the preference shares, absorbing £3,000, 5 per cent, per annum on the 1900 shares, £905, and 21 on the ordinary shares, £6,250, leaving available for final dividend

The directors recommend the declaration of dividends 219,120. The directors recommend the declaration of dividends for the December half-year at the rates of 5 per cent. per annum on the preference shares, and 3½ per cent. per annum (making 3 per cent. for the year) on the ordinary shares, payable on and after 26th February next, leaving £7,013 to be carried forward.

Annual meeting, February 23rd.

National Electric Supply Co., Ltd.

THE annual meeting was held at Preston on February 11th, Mr. John Booth presiding. The Chairman said that until the outbreak of war there seemed every probability that the company would enjoy another record year, with an increased dividend. As it was, they had reason to be thankful that after five months of war they had held their ground, and were in a position to recommend the same dividends as twelve months ago.

months of war they had held their ground, and were in a position to recommend the same dividends as twelve months ago. A year ago they adopted a profit-sharing scheme with the employés, and from his own experience of similar schemes in other businesses he felt sure that they had done the right thing in making the men feel they were partners in the concern. In the revenue account, by the new larger battery of accumulators they had made a saving of £577 in fuel, but they had to spend about £90 per annum more in the upkeep of the battery. There was a rapidly growing demand for electric heating and cooking appliances, and they found that a satisfied customer was their best advertising agent.

During the year they had added a larger number of new consumers than ever before in one year. Against this they had a decreased consumption from shops through closing earlier, and a considerable falling off in the demand from power-users. The total sales showed a falling off of £226. That would have been much larger but for the revenue from new consumers. They were proposing to again put £5,000 to reserve for depreciation and to write £500 odd off old meters, bringing the total reserve for depreciation to £50,669. The stores and stock of meters were now in such a healthy condition that he was hoping they would not require any more special amounts for some time. Dividends at 4 per cent. for the year, making with the interim dividend 8s. for the year, also £2 14s. 3d. per share on the founders' shares, were declared.

Smithfield Markets Electric Supply Co., Ltd.

SIR H. S. LEON, Bart. (Chairman), presided on Friday, at the offices, 57, Charterhouse Street, E.C., over the annual meeting of ., over the annual meeting of the company. In moving the adoption of the report (Elec. Rev., p. 225), he said that the total capital expenditure during the year was only £100. The Diesel plant installed two years ago had not been paid for, nor would it be until their dispute with the company was definitely settled. The engines were of bad design, and consequently gave a great deal of two blands. the company was definitely settled. The engines were of bad design, and consequently gave a great deal of trouble and were a source of continual expense. Dearer fuel and the cost of keeping the oil plant in working order accounted for the increase in the revenue account. The cost of maintaining the plant was much greater than it ought to be, and was likely to be heavier still. The price of oil fuel was on the increase, but so far they had been fortunate in having a contract, which however, they could not hope to renew on the same terms. however, they could not hope to renew on the same terms. The increase in lamp renewals of £270 was the result of the concession to the consumers which was arranged before the metallic lamp came into use, and it was made to meet the gas competition. The result was that they had retained pracgas competition. The result was that they had retained practically the whole of their customers, whilst new ones had been obtained. On the other side of the revenue account, sales of current showed a decrease of £571, part of which, however, was an item payable to the Corporation on the basis of the percentage of gross receipts under the terms of the company's contract with them. They had suffered, perhaps, less than most lighting companies from the war, but it was impossible to say what the future might have in store. The number of units sold was greater than last year, but the average price obtained was lower. The lamps connected showed a satisfactory increase. In view of the conditions prevailing and the prospect of increased expenditure, the Board had decided that they would not be justified in paying more than 2 per cent., and the balance of £1,330 would be carried forward, against £791 last year. The balance sheet showed that they were in a healthy position financially. They had £10,000 on deposit and nearly £4,000 besides due at the end of the year, most of which had already come in. had already come in.

Mr. J. Browne Martin seconded the motion, and the report

was adopted.

Westminster Electric Supply Corporation, Ltd.

The directors report that during 1914 the total power of lamps, motors and apparatus connected advanced from 39,646 kw. to 41,201 K.w.

Continuous current mains have now been laid in more than 97 miles of roadway, making 395 miles of ways, into which upwards of 285 miles of copper (strip and cable) have been drawn. In addition six miles of trunk mains (35 miles of ways) are laid in the company's area to connect the stations with the Central Electric Supply Co.'s station at St. John's

After paying the interim dividend on the ordinary shares After paying the interim dividend on the ordinary shares and the full year's dividend on the 4½ per cent. preference shares the balance is £26,198. Out of this a dividend at the rate of 8 per cent. per annum, less income tax, for the past half-year, is to be paid on the ordinary shares, making 9 per cent. for the year, carrying forward £5,802.

Mr. C. S. Gilman has been elected to a seat on the board, to fill the vacancy caused by the death of Lord Suffield, who was the first chairman of the company, and had served as a director for 25 years.

director for 25 years.

Annual meeting February 24th.

Notting Hill Electric Lighting Co., Ltd.

During 1914 £4,129 has been expended on capital account, making the total £252,121. The expenditure exceeds the receipts by £42,769. The cost of the joint station at Wood Lane to date has amounted to £218,187, and joint debenture stock amounting to £231,500 has been issued. The redemption of this stock is secured by cumulative sinking funds, which now amount to £66,045, invested in trustee securities.

The consumers now number 4,293 and, with the exception of 23, are supplied at 200 volts.

Revenue from the sale of current amounted to £42,087, showing a decrease of £759. The loss of net revenue attributable to the Government war regulations, restricting the lighting in London, amounted to nearly £2,000. From the available net profit of £26,663 the following sums are deducted:—
Depreciation, renewal and reserve fund £3,000 dehenter. Depreciation, renewal and reserve fund £3,000, debenture interest £2,405. Kensington and Notting Hill joint debenture stock—(debenture interest £2,668, interest on loans £324, sinking funds £1,643), income tax £1,499, distributed to staff under co-partnership scheme £253, leaving £14,871 available for divi-

After paying the 6 per cent. preferred dividend, one of 5s. per share less tax is recommended on the ordinary shares, absorbing £6,241, carrying forward £656.

The scheme of co-partnership with the company's staff, brought into operation during 1912, is still working satisfactorily. Under this scheme there will be distributed among the staff an addition to their wages of 8 per cent.

staff an addition to their wages of 8 per cent.

During the past year communications have passed between a group of London electric lighting companies, of which ours is one, and the L.C.C., in connecton with a Bill entitled the London and District Electric Supply Bill, but the necessary majority did not vote in favour of the Bill at the County Council meeting. Meanwhile, with a view to facilitating combination, the companies are associated in promoting the London Electric Supply (No. 2) Bill, initituled a Bill to constitute a company with powers to supply electrical energy in area comprising the Administrative County of London and adjacent areas; to transfer to such company certain existing undertakings and to make provision for improving the supply of electrical energy; to make provisions for transferring the undertaking of the company to the L.C.C. or other public body; for authorising agreements or arrangements between the company and the L.C.C. or other public body; and for other purposes.

The directors refer with regret to the death of their extensed.

The directors refer with regret to the death of their esteemed colleague, Sir Joseph Wilson Swan, F.R.S. They have elected Mr. Lionel Jacob, of 32, Fenchurch Street, E.C., to the seat on the board.

Annual meeting, February 23rd.

Paisley District Tramways Co.

The revenue for the year ended December, 1914, was £61,999, and the expenses were £42,025, leaving £19,974; less general interest £938, debenture interest £3,200, debenture sinking fund £1,500, leaving £14,335, plus £2,865 brought forward. Out of the balance of £17,200, £4,500 has been placed to general reserve, £7,500 is absorbed by the dividend on the 5 per cent. cumulative preference shares, £2,000 is placed to preference share sinking fund, and £3,200 is to be carried forward.

The traffic receipts show a decrease of £845. For the first

The traffic receipts show a decrease of £845. For the first six months of the year there was an increase of £777, but for six months of the year there was an increase of £177, but for the second six months there was a decrease of £1,602 due to the war. Considering the circumstances the traffic receipts are satisfactory. The amount spent on the maintenance of the track and roadway is again very heavy, and larger than in the previous year, but the condition of the track is much im-proved. The directors regret that the profits will not allow of any dividend being paid on the ordinary shares. Mr. Fred Coutts, the company's general manager, held a commission as Captain of the 5th Black Watch (Territorials), and was called out at the commencement of the war, and is now serving. In out at the commencement of the war, and is now serving. In

addition 79 members of the staff and men have joined the colours. The difficulties in carrying on the service in the abnormal circumstances have been largely overcome by the exertion and loyalty of the remaining members of the staff and men, who have done their part and kept things going.

Resolutions are to be submitted to the meeting modifying the trust agreement with reference to the special preference shareholders' sinking fund.

Annual meeting February 22nd.

Electrical Distribution of Yorkshire, Ltd.

THE accounts for the year ending December, 1914, again show steady progress. The net profit for the three years ending 31st December is as follows:—1912, £1,903; 1913, £2,569; 1914, £2,964. Including £573 brought forward there is a disposable balance of £3,537.

The directors recommend a dividend (free of income tax) for the year 1914 at the rate of 6 per cent. per annum on the ordinary shares requiring £1,809, increasing the reserve fund to £3,000 by adding £1,000, and carrying forward, subject to directors' remuneration, £727.

In February last 12,500 further shares of £1 each were conditionally allotted at par to the shareholders in proportion to their respective holdings, applications being at the same time invited for any shares not taken up. The shares were over-applied for.

The company now hold electric lighting provisional orders for the following 16 districts in the West Riding of the county:—Ardeley, Birstall, Calverley, Castleford, Darton and District, Farsley, Gomersal, Goole and District, Greetland, Hipperholme, Horsforth, Liversedge, Ossett, Rothwell and District, Sowerby Bridge, Wombwell and Worsborough.

During the year, supply was commenced in Birstall, Goole and district, Rothwell and district, and Wombwell and Worsborough. With two exceptions, a supply of energy was being given at the close of the year under all the above orders. The necessary works are being proceeded with, and supply will be available within the next few weeks, in respect of the whole of the orders held by the company. Applications are being of the orders held by the company. Applications are being made for E.L. orders for other districts in the West Riding. Annual meeting February 23rd.

Electrical & Industrial Investment Co., Ltd.

THE annual meeting was held on February 11th at Electrical Federation Offices, Kingsway, Mr. E. Garcke presiding.

The Chairman, in proposing the adoption of the report (Elec. Rev., p. 189), said that in order to adequately understand the operations of the company during the past year, one ought to divide the revenue account into two parts—the first half of the year which was more or less normal, and the second half, when things were altogether abnormal owing to the war. The first half-year yielded fairly satisfactory results, while the second half had brought them some losses and many half of the year which was more or less normal, and the second half, when things were altogether abnormal owing to the war. The first half-year yielded fairly satisfactory results, while the second half had brought them some losses and many disappointments. The dividends and interest received and sundry other profits amounted for the year to £34,295, compared with £28,330 for the preceding year, and the net profit, after deducting management and general expenses, income tax, etc., was £23,444, as against £20,751 in 1913. Last year, however, they had to deduct £3,091 from the net profits as expenses on the issue of debentures, so that, in fact, the net result for 1914 was £5,784 better than was obtained in 1913. On the whole, the net results compared favourably with those of the previous year, but they were not so good as they would have been if the war had not caused some dividends and interest to be kept back. This year he was afraid owing to the war conditions a larger number of dividends would be suspended, and for that reason the directors had deemed it advisable to pay only 6 per cent on the 7 per cent. preferred ordinary shares which were created last March. Proceeding to deal with the company's investments, the Chairman said that the majority of the securities were in electrical undertakings of which they had knowledge, but they by no means confined their operations to that class of investment. They had strictly adhered to the principle which they decided to adopt at the formation of the revenue account; to enter all investments at their actual cost; and place any surplus obtained by the realisation of investments to reserve in order to meet any deficiency on the realisation of other investments. That reserve now stood at £28,298 as against £24,223 at the end of 1913. The aggregate book value of the investments and loans after deducting that reserve was £648,629. At the last meeting he stated that a valuation made at the date of the last annual report showed a surplus of £8,000 in excess of the whole of

ciation would be shown. There was, however, no legal or other necessity for dealing with that depreciation at present, for the company having adopted the principle of keeping capital account and revenue account distinct, there was no valid objection to their distributing the profits which they made, although the market value of the investments was less made, although the market value of the investments was less for the time being than the cost price at which they stood in the books. It was evident, however, that it would be better if they could have a balance sheet which showed the whole of their capital to be intact. At the present time, especially, such a balance sheet would place the company in a strong position for dealing with the situation created by the war, and for earning increased profits. They had, therefore, conferred with the larger holders of the deferred ordinary shares as to what should be the policy of the company on that question. They were in an exceptionally favourable position to adjust their capital account to the revised value of their investments, because the deferred ordinary shares, of which there were 90,000 of £1 each fully paid, were entitled to all the surplus profits after the preferred orinary shares had received 7 per because the deferred ordinary shares, of which there were 90,000 of £1 each fully paid, were entitled to all the surplus profits after the preferred orinary shares had received 7 per cent. in any one year, and they were also entitled in the distribution of assets to any surplus remaining after the debentures had been paid off. It was practically a matter of indifference to the holders of the deferred ordinary shares whether their, shares, had a denomination of £1 fully paid or of 1s. full paid or any other denomination, as they received the entire surplus both of assets and of profits irrespective of paravalue of their shares. As a matter of fact, it was better for the holders that the nominal value of the shares should be 1s., which would give them a higher market value, than that they should remain at the nominal value of £1 and have a smaller market value. The larger holders of those shares agreed with the directors that it would be wise to reduce the company's capital by writing down the deferred ordinary shares to is, each. The effect of that policy would be to place the company in a strong position and to improve its facilities for exchanging some of its present depreciated securities for others which promised to prove of a more profitable character. The proposal would not directly affect the holders of the debentures, the preference, and the preferred ordinary shares, but those holders would all benefit in due course by the improvement in the position of the company, which it was anticipated would follow from the adoption of that policy. The directors proposed at an early date to convene an extraordinary meeting, and also a class meeting of the deferred holders, in order to consider this proposal.

Mr. C. H. Dade seconded the motion, and the report was adopted.

adopted.

St. James' and Pall Mall Electric Light Co.. Ltd.

The annual meeting was held on Tuesday at Carnaby Street Station, Golden Square. Mr. WALTER LEAF, who presided, said that the year began with most favourable prospects, and said that the year began with most favourable prospects, and for the first six months the revenue was growing steadily, and when they declared the usual interim dividend in July they had every reasonable confidence that at the end of the year they would be able to sustain the dividend at 12 per cent. without the least difficulty. The effect of the war upon their revenue was instantaneous. He was not going to complain of the police regulations with regard to lighting, but they supplied a larger number of well-to-do shops than any other lighting company, and it was upon those establishments that the restrictions had fallen most severely. The result was that their sales had fallen from 11,605,000 units to 11,171,000, a decrease of 3.7 per cent., and their revenue showed a drop of 4.1 per cent. That might seem a small decrease in itself, but it became serious when they considered that it was entirely due to the second half of the year, and that the first half showed a marked improvement on the first six months of 1913. The net revenue had amounted to £34,347, against £35,942, and it would seem at first sight as if the smallness of that drop was very satisfactory under the present circumstances. There again, however, they had to remember that the special approvery satisfactory under the present circumstances. There again, however, they had to remember that the special appropriations which they had been for some time making out of revenue for the replacement of obsolete plant came to an end in 1913, so that this year they had been able to bring into revenue more than £3,000 which last year they set aside. That was shown in the reduction of the amount received for depreciation from £16,209 to £13,069. But for that they would show a loss of profit of over £5,000 all in the last half of the year. That however, did not massing all that they men had show a loss of profit of over £5,000 all in the last half of the year. That, however, did not measure all that the war had cost them. The actual profit available for dividends made during the year was £27,133. Of this £17,500 was made in the first six months. They had every reason to expect that, but for the war, the second half would have been at least as good as the first, and that they would have shown not less than £35,000 as the result of the whole year's working. They were quite prepared to face a continuance of the war. Supposing that present conditions continued to the end of the year, they had come to the conclusion that that would mean an additional loss of £9,000, and in all they would lose £17,000 in 1915 compared to their profits in 1913. That was what they had before them in recommending the dividend. On the other hand, they had to remember that this loss of profit was purely temporary. The earning power of the company was in no way affected, and they had every reason to suppose that the moment affected, and they had every reason to suppose that the moment the war came to an end their sales would return to something like their old level. On those facts he felt confident that they

would agree that it would not be prudent to maintain the 12 per cent. dividend paid last year. Even if they were to pay it for 1914, they could not expect to maintain it for the present year. They therefore proposed to revert to the old figure of 10 per cent., which they had paid for many years up to 1913, and to put the handsome sum of £4,000 to the contingency fund, which, if the worst came to the worst, would enable them next year to maintain the dividend at 10 per cent. He was glad to say that 42 of the staff, about 24 per cent. of their normal establishment, had joined the colours. While thanking and congratulating those who had been privileged to serve their country in this way, they must not forget the claims of those who had also served their country by staying at work. In some ways their task had been the hardest. The work of that and other lighting companies was essentially public work, and its maintenance was a matter of very serious responsibility; much of it could only be entrusted to men possessing skill and and its maintenance was a matter of very serious responsibility; much of it could only be entrusted to men possessing skill and experience which could not be manufactured to order in a few months. It was impossible for them to give leave to such men, and it should be fully recognised that the post of duty for them was not with the colours but here at home. Turning to the question of bulk supply of electricity for London, he said that the whole matter had been the subject of acute discussion, and had been taken up by the L.C.C. in a way which very materially affected every individual undertaker whether company or municipality. The L.C.C. embodied their scheme in a Bill, of which the salient feature wits to be the establishment of a single large company to supply the whole of London—a company formed outside the County Council, but operating under its control. A large majority of the companies had been —a company formed outside the County Council, but operating under its control. A large majority of the companies had been constantly in conference, and had come to the conclusion that it would be well to enter into negotiations with the L.C.C. and endeavour, if possible, to work in harmony towards the establishment of such a scheme—always, of course, with full regard to the interests of their shareholders. The result of those conferences was that a Bill was deposited in Parliament which an operating company as the L.C.C. contemplated. Since the Bills were deposited, however, the whole situation had been changed. The L.C.C. had failed to obtain the necessary majority for the further prosecution of their Bill, and since the Prime Minister's statement in the House that no contentious business would be taken made it highly probable that the company's Bill also would be hung up. Under their scheme the Prime Minister's statement in the House that no contentious business would be taken made it highly probable that the company's Bill also would be hung up. Under their scheme it was proposed to constitute a company with powers to supply electricity in the county of London and adjacent areas; to transfer to the company ten of the existing undertakings; to provide for transferring the undertaking of the company to the L.C.C. or other public body; for authorising agreements between the company and the L.C.C. or other public body; and for other purposes. As to the principles upon which they were proceeding, they had no doubt that by centralisation of administration, and though to a less extent of generation, economies might be effected in the supply of energy to the London district. In the effecting of those economies they were ready, and indeed, anxious, to co-operate both with other companies and with the L.O.C. They were prepared to advise the shareholders to sell their property either to the L.C.C. or to an amalgamation at a price and on conditions. But the price and the conditions must be fair. By a fair price, he meant two things. In the first place, proper regard must be had to the position of security which that company had attained by prudent attention to reserves and depreciation in the past. Prudence must have its full reward. In this respect they held an exceptionally strong position which they could not allow to be disregarded. In the second place, the price must be paid in solid value—if not in cash, then in some form which might be regarded as equivalent to cash, at least for a very substantial part of their holding. Another important principle on which all the parties to the conference were in agreement was that all centralisation of supply must proceed by development of existing resources, and not by scrapping at a blow what had been already effected. He did not admit that London, even under existing conditions which were forced upon them by under existing conditions which were forced upon them by Parliament years ago, had any reason to be ashamed of the cost of its supply; on the contrary they asserted that the supply was at least as cheap as that of any great city in the world. There was another consideration which must have forced itself. upon them during the present crisis. An essential part of the more ambitious schemes which had been put forward for the cheapening of supply was a huge central generating station for all London on the river side below the city. Did they think that such a concentration of one of London's most vital supplies at that point would conduce just now to the sense of public security? Was not the fact that generation was scattered over various parts of London an element of safety, and even if such a concentration resulted in a fractional reduction in the price of the unit, would the gain be worth it? They had higher interests just now to consider than decimals of a penny. The situation was in all respects most interesting. and he was confident that, even though immediate action was likely to be suspended by the war, they would be using their time well in negotiation, whether with the L.C.C. or among themselves. Mr. Marlborough R. Pryor seconded the motion.

Replying to a shareholder, the CHAIRMAN said that the company was paying half salaries to all the members of the staff who had enlisted and was keeping their places open.

The report was adopted.

Neuhausen Aluminium Industry Co.—The directors Neuhausen Aluminium Industry. Co.—The directors of the Aluminium Industrial A.G., of Neuhausen, have resolved to recommend the payment for 1914 of a dividend of 20 per cent. on the old share capital, which is paid to the extent of 60 per cent. of the nominal capital, as compared with 20 per cent. on shares, which were 50 per cent. paid up in 1913, and a dividend of 10 per cent. on the new capital of £360,000, which was issued last year, and which is also 60 per cent paid. The sum of £64,500 has been placed to the fund created for the purpose of gradually paying up the shares in full out of the profits, so that the fund now amounts to £69,500, or 5 per cent. of the total share capital of £1,400,000. A year ago there was allocated to this fund, from which free A year ago there was allocated to this fund, from which free payments in 10 per cent. instalments are made on the shares which are not fully paid, the amount of £84,000, thus increasing the total to £109,000. Of this the sum of £104,000 was applied to raising the payments on the old capital from 50 to 60 per cent., leaving a balance of £5,000, which again rises to £69,500 by the appropriation now made from the profits earned in 1914. A further amount of £12,000 was appartioned to the disposition fund in 1913, but for the past wear the directors have set aside fund in 1913, but for the past year the directors have set aside \$40,000 for war taxes and risks, and £6,000 for relieving distress in Switzerland. The balance then remaining is about the same as in 1913 (£13,000), so that it is assumed the net profits for 1914 must have exceeded those realised in the previous year by

Crossley Brothers, Ltd.—The directors report that for the year ending December, 1914, the amount to the credit of revenue account is £53,847, out of which a dividend has been paid revenue account is £53,847, out of which a dividend has been paid on the preference shares at the rate of 5 per cent, per annum the first half of the year, amounting to £10,085. It is proposed to pay a further dividend for the second half of the year at the rate of 5 per cent, per annum on the preference shares amounting to £10,085, carrying forward £33,678. Mr. D. Hastings Irwin has resigned his seat on the board after more than 42 years' association with the command after more than 42 years' association with the company. Annual meeting, February 24th.

Buenos Aires Electricity Co.-The report of the Compania de Electricidad de la Provincia de Buenos Aires, Ltd., states that the gross profit for the year to July, 1914, amounted to £86.794, an increase of £6.454. The administration and general charges in Buenos Aires were £12,497, as against £20,037, a decrease of 25.12 per cent. The average ratio of the working expenses was 54.72 per cent., which is not as low a figure as the board had hoped for. £9,000 has been appropriated to depreciation, and after payment of debenture interest, &c., £10,656 is carried to the balance-sheet.

Bruce Peebles & Co., Ltd.—During 1914 the works were fairly well employed with results which show satisfactory and steady progress. After deducting administration expenses, interest on mortgage debentures and unsecured debentures, the net profit is £3,893. Buildings, machinery and plant have been maintained out of revenue at a cost of £4,449. Owing to other engagements, Mr. Lee Murray retired from the board early in 1914, and another director, Mr. A. Bruce Anderson, perished in the wreck of the Empress of Ireland. Annual meeting, February 26th.

Rushden and District Electric Supply Co., Ltd.—The directors report great progress during the past 12 months, which is largely attributable to the growth of the power load. The number of consumers increased from 56 to 79. The lamps connected (including motive power) numbered 5,561 at the end of the year 1914, as compared with 2,480 at the end of 1913; the units sold have been 56,993. There is every prospect of a steady and increasing output

Metropolitan Railway Co.—The directors recommend a dividend at the rate of 1 per cent. per annum for the second half of 1914, making $1\frac{1}{4}$ per cent. for the year, transferring £12,500 to general renewals, and carrying £11,500 forward.

Bastian Meter Co., Ltd.--The directors recommend the payment of the 6 per cent dividend on the cum, preference shares, also one of 2 per cent on the ordinary share capital for the year ended December 31st. 1914.

South Metropolitan Electric Light and Power Co., Ltd.—The transfer books are closed from February 16th to March 1st, for the preparation of warrants for dividends on 7 per cent. cumulative first preference shares and 6 per cent. cumulative second preference shares.

Calcutta Electric Supply Corporation, Ltd,-The number of units delivered to consumers during the four weeks ended December 25th, 1914, amounted to 914,335, compared with 952,773 in the corresponding four weeks of 1913. The decrease is owing to consumers taking less current on account of the war.

Kensington and Knightsbridge Electric Lighting Co., Ltd.—The directors recommend a dividend at the rate of 10 per cent. per annum for the half-year ended December 31st last, this making, with the interim dividend, 9 per cent. for the year. The total for 1913 was at the same rate.

Oxford Electric Co., Ltd.—The directors recommend a dividend at the rate of 4 per cent., less income-tax, on the ordinary share capital, for the December half-year, being a distribution for the year at the rate of 61 per cent. The rate for 1913 was 7 per cent.

Mather & Platt, Ltd.—The Financier states that the directors recommend a dividend on the ordinary shares for the year to December 31st at the rate of 10 per cent, per annum, with a bonus of 2½ per cent., both free of income-tax, less the interim dividend of 5 per cent., already paid.

Ottawa Electric Railway Co.—Fifteen per cent. was paid in dividends according to the report presented at the annual meeting of the Ottawa Traction Co. held on February 3rd. This involved a total cash payment of \$281,535. Of this amount \$204,818 was transferred. The gross earnings were \$1,096,459, and operating expenses \$665,226. The net earnings were \$431,232, as against \$414,100 in 1913.

Telegraph Construction and Maintenance Co., Ltd. —It is proposed to distribute, in addition to the interim dividend of 5 per cent. paid in July last, a further dividend of 10 per cent., together with a bonus of 12s. per share.

Newcastle-on-Tyne Electric Supply Co.—The Times states that the directors announce a final dividend of 3 per cent, on the ordinary shares, making 5½ per cent. for the year, the same as for 1913.

STOCKS AND SHARES.

Tuesday Evening.

BUSINESS in the Stock Exchange moves as quietly as the progress of the war on land. A good many members of the House find that the number of orders at the present time is considerably less than it was a month ago, although that certain sections are busylis shown by the daily number of transactions marked in the Stock Exchange Official List. The tedious, and sometimes exasperating, delays caused by the Treasury regulations have become part and parcel of Stock Exchange life; so that it is clients, more than their brokers, who resent the difficulties thrown across their path. The tale of Home Railway dividends is practically complete, and will be finished before the end of the week. On the whole, the results are diappointing.

sults are disappointing.

The railway companies are holding their meetings and issuing reports, but the absence of any details as regards figures is against public interest arising in this department. The steam stocks can be bought to pay 5½ to 6 per cent, on the money, and something between this will probably come to be regarded as the rate which investors require from money put into such securities. In a dull market, the firmness of Underground Electric Income bonds stands Iú a dull market, the firmness of Underground Electric Income bonds stands out conspicuously; on the week, the price is \$\frac{1}{2}\$ higher at \$83\frac{1}{2}\$, this including the dividend of £3, payable net on the lat of next month, Allowing for the inclusion of the dividend, the yield works out to 7\frac{1}{2}\$ per cent. The Company's shares are unchanged. Districts have hardened a shade, but Metropolitans further went back to 30, the dividend being considered very meagre. At the same time, the pre-Ordinary securities are very firm. Metropolitan new Preference is 99\frac{2}{1}\$, South-Western new 104\frac{1}{2}\$, and other Preference stocks are difficult to get at anything like reasonable prices.

Brazilian exphange has been presetting the market for most

Brazilian exchange has been upsetting the market for most things connected with that country. It fell last week to 12½d., recovered ½d., and is a little easier at the time of writing. On this, Brazil Tractions have fallen 2½ to 52; and most Brazilian securities have also given way. The Argentine group, on the other hand, diaplays more resistance to the few sellers which have lately. hand, displays more resistance to the few sellers which have lately troubled the market. Prices are all firm; indeed, Argentine descriptions have begun to re-establish a place for themselves in popular favour—a point that will be noted with pleasure by the many British holders of stocks and shares of industrial companies operating in the Republic. Mexico, on the other hand, merely goes from bad to worse, if that be possible. Mexico Tramway shares have halved the price at which they stood at the end of July, upon the outbreak of war; and the Company's bonds are extremely nominal at the quoted value.

It is a little instructive to stand in the Stock Exchange by the side of a jobber dealing in purely investment issues, and to hear his replies to one man and another as they ply him with questions. In the Telegraph market, for example, one may see a broker walk up to a jobber and ask him the price of Eastern Extension shares, to which the rolls is up to a jobber and ask him the price of Eastern Extension shares, to which the reply is pretty sure to be that the latter can place them at a good price, but is not so sure of being able to get the offer of any. The next will perhaps ask the price of Henleys, and "about 13\frac{1}{2}" will probably be the reply, "but we have only cheap buyers." So the wheel goes round; and if anyone took the trouble to run through the list and ask what stocks were on offer, he would probably be surprised at the comparatively few open for his selection. We refer, of course, to purely investment securities: of rubbish there remains an extremely bountiful supply.

County of London Ordinary and Preference are both a little County of London Ordinary and Preference are both a little easier. Small falls have occurred in Charing Cross Ordinary and Preference, and in St. James' Debenture stock. London Preference are is higher. Another batch of dividends should be out this week; and if it is of any interest for the curious to compare results with prophecies, we may mention that Stock Exchange estimates look for a reduction of 1 per cent. in the City of London dividend, maintenance of the last County dividend and reductions of 1 to 1 per cent. in several other cases. The situation as regards coal and the continued turning down of London's lights are two of 1 to 1 per cent. in several other cases. The situation as regards coal, and the continued turning down of London's lights are two of the principal factors making for public disinclination to touch electric lighting shares at the present time. That the second reading of the London Electricity No. 2 Bill should have been postponed will perhaps afford no great astonishment to those who follow this review.

follow this review.

The Manufacturing group is very quiet, with buyers of Henleys, as noted above, and of various other highest-class telegraph manufacturing shares. Electric Constructions are a shade easier at 13s. 6d. Armament shares, after being dull, show a tendency to harden. On Friday this week will be held the meeting of the Projectile Company, which should prove a particularly interesting function. The Rubber market pursues the even tenour of its way, without disturbance in one direction or the other. In many of the leading shares there is a tolerable amount of business going on; for the rest, the public appear to be more ready to buy than they for the rest, the public appear to be more ready to buy than they are to sell.

The yields on some of the electricity supply preference shares begin to look tempting. Taking a few of the leading undertakings, the Preference shares of the Westminster Company pay

4% per cent.; City of London, 4% per cent.; London Electric, 5% per cent.; County and St. James's, 5% per cent. each; Charing Cross, 5% per cent.; and Metropolitan 5% per cent. These figures are worked out on the existing prices, without taking into account accrued dividends, so that in nearly every instance the actual yield is rather higher than given. The difficulty, as indicated above, in the case of telegraph stocks, is to get the offer of first-class shares at current prices, but probably most of the Preference issues mentioned could be obtained at, or quite close to, the prices given in our lists. in our lists.

MARKET QUOTATIONS.

OWING to the war, the prices given below are, of course, more or less nominal.

detail in the composition of the undertaking. There are so many little matters calling for careful attention which, if allowed to become neglected, very soon commence to push up the works costs, and the Chief sees this working reflected as in a mirror on the various log-sheets. A few minutes spent day by day in looking over the results of the previous day's working convey to his mind a general impression of the efficiency of the previous day's run. Units, coal, oil, steam pressure, vacuum, and the dozen or so other items which are given on the sheets or in the log-book, prompt questions in his mind which are in turn put to those in charge; for it is only by careful and unremitting attention to details that it is possible to obtain from the works the most profitable results.

The matter resolves itself into one of pounds, shillings and pence. For example, low vacuum means more steam used for a given output, and more steam requires extra coal, and coal costs money.

I do not propose here to continue expounding examples. There are very few engineers who do not recognise the necessity and importance of this form of record, but for the many scores of readers who must be interested in this subject, I give herewith a number of patterns taken from several log sheets and books at present in use in some London stations. Not all the rulings may prove new or novel, but, on the other hand, some very useful tips can often be obtained by studying the work of others. One way in which they might prove useful is that the cost of printing might be reduced by a saving in the work of

printing where better arranged headings are devised, and sheets provided which save repetition of figures.

These illustrations are taken from books and sheets, some weekly and some daily forms, and I think no further explanation is required than the forms themselves.

MODERN WIRING WORK, PARTICULARLY IN BAD SITUATIONS.

By H. C. TOFIELD.

(Concluded from page 205.)

Tumbler switch, 5 amps. (White's patent).—This is made in porcelain, and also in galvanised iron for positions where it would be subject to mechanical

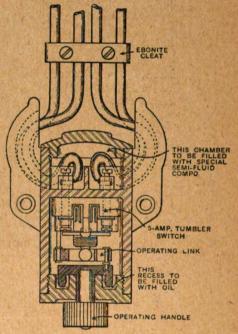

FIG. 6.—SECTION OF SWITCH.

damage. It will be seen (fig. 6) that the switch is contained in a chamber separate from that which contains the connection terminals for the wires.

Fig. 7.—Switch in Position.

This enables the wireman to connect up and deal with the ends of the wires without interfering with the mechanism of the switch. The seal-

ing of the ends and terminals is effected by filling up the top chamber with the special semi-fluid compound, which is forced up the "leading-in-tubes" to a higher level when the top cap is screwed on, thus giving a longer sealing path. The operating of the switch is effected by a special link motion, while gases are effectively prevented from entering along the operating handle by means of the oil seal. This method does away with the necessity of a packing gland, with its attendant troubles.

ing gland, with its attendant troubles.

Lampholder (White's patent).—This holder, fig. 8, was specially designed to prevent corrosion of the terminals and the lamp cap and to supersede the so-called acid-proof fitting with its many failings, the chief being, that condensation takes place inside the well glass which in time accumulates in such

FIG. 8.—CORROSION-PROOF LAMPHOLDER,

quantities that chemical action is set up inside the fitting, thus defeating its own object and also greatly reducing the light owing to fogging of the globe.

The corrosion-proof lamp holder is not liable to the above trouble, as no outer globe is required.

Among the advantages claimed are the following:

1. The contacts, terminals, &c., and the lamp

cap are protected from corrosive agents.

2 It is watertight and may be used under water.

2. It is watertight and may be used under water.
3. The lamp is automatically locked and cannot be taken out by anyone not fully acquainted with its construction.

Wall plug (Reyrolle's patent).-The wall plug shown in fig. 9 has been specially designed for positions where it is essential for the apparatus to be completely watertight.

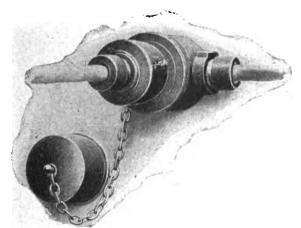

FIG. 9.—REYBOLLE PLUG AND SOCKET.

It complies with the Home Office regulation which calls for the use of a separate earth conductor in the flexible cable. When the socket is fixed to the wall its allows the plug to be withdrawn either vertically or horizontally. In use the plug is secured to the socket by means of the clamping ring, and a brass cap is provided to take the place of same when not required, thus protecting the plug connections

from moisture and fumes under all circumstances. Rubber ring-grip packing glands are supplied in both the plug and socket portions for taking the incoming and outgoing C.T.S. cables

and outgoing C.T.S. cables.

Entrance glands.—These glands are made of ebonite, and are used in conjunction with distribution boards, main switches, suses, and wall plugs having iron cases; they are also useful as a means of connecting up to any special apparatus and provide a convenient and reliable method of bringing the wires and cables into any of the above accessories; at the same time they form an air-tight joint and prevent sumes entering the cases and attacking the ends of the wires.

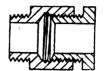

FIG. 10.—EBONITE STUFFING BOX.

The entrance holes of the glands are an easy fit for the wires, but when the caps are screwed down, the rubber ring is compressed, thus forming an airtight joint. Under exceptional circumstances a small quantity of Chatterton or similar compound is run round the wires at the glands as an extra safeguard.

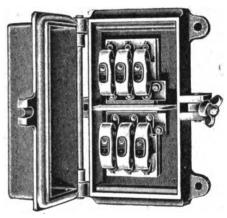

Fig. 11.—Watertight Distribution Board.

Special rubber washers can be obtained for fitting between the glands and case into which they are screwed.

Distribution boards.—These may be of the ordinary watertight iron-clad pattern (fig. 11), having heavy cast iron cases with hinged solid fronts. The type of porcelain or slate bases and fuse carriers used is a matter for discretion, but all metal work should be substantial.

It is most important that a first class heavy case be used, and that the door be an airtight fit: if rubber jointing is supplied it should be removed and greasy asbestos packing substituted, or a strip of the outer sheathing cut from the C.T.S. wires will provide a reliable packing. The cases should be galvanized and finally coated with bitumastic paint when fixed in corrosive situations. All holes should be tapped to receive the glands, the usual dimensions being § in. and § in. conduit threads for circuit wires, and larger according to requirements for the main cables.

according to requirements for the main cables.

Main switches and fuses.—The iron cases should conform with the requirements enumerated for distribution boards. The handle, whether at the side or in the lid should operate through a gland. A switch and fuses combined in one case as shown in fig. 12 form the best arrangement.

Fixings.—Lead, porcelain and ebonite saddles and cleats should be used for fixing the wires and cables. The last two are the least affected by corrosive conditions.

Erecting the wires.—The erection of the wires and cables hardly calls for any description, as they are fixed in a similar manner to ordinary lead

covered wires saddled direct to walls and ceilings; they are, however, very much easier to handle and they can be bent to any desired shape without injury. Under exceptional circumstances it is advisable to

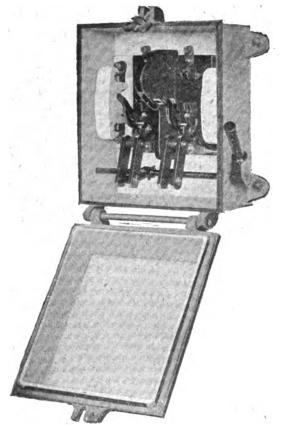

FIG. 12.—IRONCLAD SWITCH-FUSE.

use ebonite or porcelain cleats for securing the wires, with the object of keeping them off walls, and to allow the free passage of air behind them, fig. 13.

Where switch wires are to be sunk in walls it is sometimes an advantage to enclose them in a tube

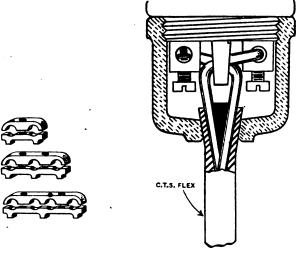

FIG. 13 -EBONITE CLEATS FOR WIRING.

FIG 14 —SHOWING WEDGE TO TAKE STEAM OFF FLEXIBLE.

to allow for an extra switch wire being drawn in at a later date, if required.

Motor wiring.—It may be of interest to mention that the C.T.S. system forms an ideal method of wiring for motors, &c., in severe situations. For three-phase current it is made up in three-core circular cable to any desired size, and also four-core cable can be supplied, one conductor forming the earth wire.

In carrying out wiring for motors with three and four-core cables, these need not be treated in the same careful and expensive way as most types of cables, where the ends have to terminate in trifurca ting boxes. This is because each core (of the St.

Helen's make, at least) usually has a layer of C.T. sheathing over the insulation, which is designed to resist corrosive moisture from attacking the tail ends, as it does in the case of other cable ends. This saves not only the cost of boxes, but that of jointers.

Portable apparatus.—The use of C.T.S. flexible

cable for portable apparatus calls for special reference, as it possesses distinctive features which render it invaluable for many purposes.

It is particularly adapted for use with domestic utensils such as electric irons, kettles, and cooking and heating apparatus on account of its smooth surface, small overall diameter, and waterproof nature.

Trouble is frequently experienced with ordinary flexible cords attached to laundry irons owing to the constant breakage of the wires at the connectors, this defect being usually caused by kinking and rough handling. It will be found that C.T.S. flexible cannot be kinked, and its life may be safely taken at six times that of the ordinary kind when used under the most severe conditions, providing a proper connector is used that will keep the insulation from contact with the iron.

Workshop flexible cord attached to portable hand lamps, especially where used in garages and similar places, is usually troublesome, as the conductors are constantly breaking, while the braided cotton cover-

ing soaks up water and oil with disastrous results.

The writer has used the C.T.S. type of flexible cable for almost every kind of portable apparatus, and it has been frequently acknowledged by clients that its life has many times exceeded that of all other kinds formerly used.

It may be mentioned that C.T.S. flexible cable is supplied in twin circular or three core with earth wire, the standard sizes being 6/30 and 11/30. To increase the tensile strength of both these conductors, one strand is of steel wire.

This type of flexible is made up to almost any size for use in conjunction with coal cutters, cargo clusters, electric drills, lifting magnets, and heavy portable workshop tools, and for numerous other purposes, a description of which is beyond the scope of this article.

A novel method of taking the strain off the wires in connection with C.T.S. cables may be mentioned. It is to insert a short wooden match down the end of the sheathing where it passes through the hole in the ceiling rose, or in the portable lamp handle. This acts as an internal wedge, which enlarges and effectually jams the cab tire sheathing in the hole. Sometimes two matches are necessary and are as effectual. Fig. 14 shows the original method as devised and patented, but it is found in practice that matches are handier, and, of course, less expensive, than the shape of wedge shown. Other types of protected cable do not seem so easily adaptable to such a simple improvisation.

MODERN METHODS OF ELECTRICAL WIRING.

ON January 16th, Mr. TD. S. Munro, M.I.E.E., read a paper on this subject before the Scientific Society of the Royal Technical College, Glasgow. The author described and criticised the methods ordinarily used, giving many practical hints, and showed a disposition to favour wood-casing in preference to steel conduit for the protection of the wires. The subject of surface wiring was also dealt with, and Mr. Munro described a new type of C.T.S. wiring which he had devised. The following is an extract from his paper:—

lowing is an extract from his paper:—
A notable addition to the wiring resources of the electrician is the introduction of cab-tire sheathing. This material, although a rubber mixture, has not highly insulating qualities, so it is not generally used as an insulator but as a mechanical and chemical protection. This sheathing has surprisingly good qualities of resistance to mechanical injury, and is impervious to all the usual chemical sources of deterioration.

It can be used in such places as stables, breweries, dye-houses, laundries, etc., when almost every other kind of pro-

tective cover fails, and, unlike lead, it will stand unlimited vibration and temperature changes without cracking.

Two or more wires insulated in the usual manner are commonly laid up together within this cab-tire cover. For indoor surface work in good buildings it is not always easy to make it pleasing to the eye, because of its considerable diameter and its reluctance to retain the desired straight or curved positions whether constructed in circular or oval section. It is also subwite constructed in circular or oval section. It is also subject to dust troubles. If, notwithstanding its resilient strength and durability, it is pierced as by a sharp nail, a partial and therefore more dangerous short circuit may be established.

To reduce these minor disadvantages and make the system more widely suitable for surface or covered work, the author has recently protected a modified construction—the C.T.S. concentric system.

ontric system.

The core consists of one or two tinned copper cables, rubber capped. Lapped The core consists of one or two tinned copper cables, rubber insulated to the C.M.A. specification, and taped. Lapped closely around this is a ribbon of tinned copper wires; these are so laid that side by side contact is fully maintained. The whole is then taped and finally covered with a tough layer of calculate sheathing. centric system. of cab-tire sheathing.

The inner conductor is thus highly insulated and is doubly protected against injury, first by the copper windings of the exterior conductor, and then by the resilient consistency of the

protected against injury, first by the copper windings of the exterior conductor, and then by the resilient consistency of the outer sheath.

Although the cable is made in concentric form, it is not intended that its use should be confined to installations planned on what is currently understood to be the concentric method. This method assumes that one pole is deliberately method. This method assumes that one pole is deliberately connected to "earth" at a point, where the concentric system begins, usually at the main switch; also that single pole begins, usually at the main switch; also that single pole switches and fuses on the live wire only are used. When, switches and fuses on the live wire only are used. When, switches and fuses on the live wire only are used. When, switches and fuses on the live wire only are used. When, switches the first purpose over the metal-covered consenses very distinct advantages over the metal-cover

It may be interesting to mention that the combined effect the cab-tire sheathing. It may be interesting to mention that the combined effect in the external conductor of the greater copper area, longer length due to spiral winding, and of the side contact between turns of wires is that the ohmic resistance of the external conductor is approximately half that of the inner. This apparent extravagance in copper is partly to provide armouring for mechanical protection. It has some advantage in reducing temperature rise and fall of potential. In most circuits the return wire has most current to carry as it serves more lamps than the individual switch wires. The cost of the extra copper is negligible as there are no expensive Para rubber coverings to go over it.

have not yet obtained figures of the actual temperature

I have not yet obtained figures of the actual temperature rise nor of the self-inductive effects due to the coiled form of outer conductor, but as the 36 strands of the latter are laid side by side to form a ribbon the turns have a long "lay." The author is reluctant to run the cable through a bath of tin before adding the outer covering, lest the heat should injure the internal rubber. All the strands are, of course, injure the internal rubber. All the strands are, of course, tinned, and the free individual form is far more convenient for use at terminals and joints. The whole construction, indeed, lends itself to quick and easy manipulation with standard accessories.

In many cases it is easier to carry both conductors through the switch box. If this is done the switch boxes are lined with, or constructed of, insulating material. It is easy to fill up the junction boxes and seal the terminal boxes with compound in places where it is better to have everything water-

proof.

It is claimed for this system that it is neat enough for surface and safe enough for concealed wiring. There are no conduits to rust, and there can be no condensation to destroy the duits to rust, and there can be no condensation to destroy the rubber. It is free from dust troubles. There is nothing that rubber insulation is preserved by the outer sheathing, which itself shows no signs so far of deterioration by time. There is no risk of cutting the main insulation in removing the outer no risk of cutting the main insulation in removing the outer covering. There is a minimum of fibrous material to transmit the sture. Having a smooth surface it can readily be painted to suit surroundings. It takes almost any curve required, a feature specially advantageous in ship work. It will stand feature specially advantageous in ship work. It will stand

unlimited wear. In iron bulkheads it is almost self-plugging. It is impossible to get a shock between an imperfect switch or fitting and the outer covering.

The chief excellence of the system, however, is that there is no external metallic surface to carry leakage and short circuit currents throughout a building to points of danger. Like wood casing, its outer protection is an insulator, but unlike wood casing, it is damp and acid proof. In extra hazardous risks, it may be covered with fireproof material, though it is difficult to set on fire.

CONDITIONS AFFECTING THE VARIATIONS IN STRENGTH OF WIRELESS SIGNALS.

By Professor E. W. Marchant, D.Sc., M.I.E.E.

(Abstract of paper read before the Institution of Electrical Engineers, February 11th, 1915.)

THE changes which take place in the strength of signals received from any transmitting station are well known to every wireless operator. Remarkable distances have been covered at night by using comparatively small-power plants; for example, the signals from a boat sailing from Gibraltar to Port Said with a standard 1.5 kw. set were received at Liverpool with great clearness on Sunday evening, 14th June, 1914, i.e., at a distance of over 1,200 miles.

The complete explanation of freak signals such as this is a matter that requires further investigation.

a matter that requires further investigation.

Although many records have been taken, very few of these give actual measurements of signal strength, and it was with give actual measurements of signal strength, and it was with the view of securing such information that the following inves-tigations were undertaken.

Their scope is confined to (1) observations of the effects of atmospheric conditions of all kinds on the strength of signals, and for this purpose a series of observations lasting for a year

Their scope is confined to (1) observations of the effects of all kinds on the strength of signals, and for this purpose a series of observations, lasting for a year, has been made; (2) variations noticeable at sunset in the strength of the signals; (3) observations on fluctuations in the strength of signals during the night.

The stations between which most measurements have been made are Liverpool and Paris, which lie mutually almost north-west and south-east. Some results are recorded in connection with the new station (recently destroyed) erected in nection with the new station (recently destroyed) erected in nection with the new station (recently destroyed) erected in has been done in connection with the Eiffel Tower station.

H. Mosler, in August, 1913, found that the day strength appeared to be very nearly constant, i.e., it was not affected by the altitude of the sun. The ratio between night strength and day strength varied considerably, being greatest in the spring and autumn and least during June, when the ratio was sonly 1.04. The maximum ratio was 3.15 on 13th November, the other maximum being 2.2 in April.

A. H. Taylor found that the best condition for signalling was when the intervening space was cloudy. Signals were not so strong on a clear day, or in bright sunshine. This result cannot be explained by the reduced ground absorption after cannot be explained by the reduced ground absorption after cannot be explained by the reduced ground absorption after cannot be explained by the reduced ground absorption after cannot be explained by the reduced ground absorption after cannot be explained by the reduced ground absorption after cannot be explained by the reduced ground absorption after cannot be explained by the reduced ground absorption after cannot be explained by the reduced ground absorption after cannot be explained by the reduced ground absorption after cannot be explained by the reduced ground absorption after cannot be explained by the reduced ground absorption after cannot be explained.

to take place at a height of between about 2,500 and 3,500 metres.

His results seem to provide clear evidence that there is, on a much lower level than has previously been suggested, a mass of ionized air which absorbs a considerable amount of the energy of the transmitted electro-magnetic waves.

Howe has shown that the current received by an antenna at a great distance from the transmitter, on the assumption of a perfectly conducting earth and on non-ionized atmosphere, is much smaller than that actually found by experiment, thus strongly supporting the theory of reflection or refraction due to ionization of the upper atmosphere.

The aerial employed in connection with the author's tests was of an L shape, having an horizontal length of over 500ft, and a vertical height above ground of 150ft. The earthing system consisted of a ring of water pipes connected with the water-pipe system of the building.

The arrangement of the circuit used in connection with the aerial is shown in fig. 1. The coupling between the aerial circuit and the receiving circuit for most of the records was 3.75 cuit and the receiving circuit for most of the records was 3.75 per cent. The coupling coefficient was accurately measured be determined from the readings of the galvanometer in series with the crystal detector on the closed circuit. The measurements of mutual induction, self-induction, and capacity were made by a Campbell mutual variable standard used in con-

junction with a high-frequency (500 periods) alternator and vibration galvanometer. This arrangement has enabled measurements of inductances, of the order of 10 microhenries, to be made within 1 per cent. without serious difficulty. The crystal combination used in nearly all the tests was the one known as perikon, with crystals of zincite and chalcopyrites. The secondary circuit was calibrated on the same wavelength as that of the received signal. This not only surmounts the difficulty that the sensitiveness of the crystal may depend upon the frequency of the currents passing through it, but enables the antenna current to be determined directly in terms of the current in the buzzer circuit by a constant multiplier. The current flowing in the crystal circuit connected to any

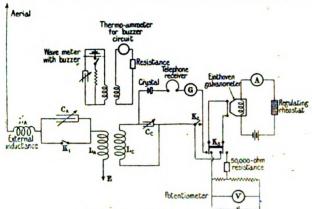

FIG. 1.-RECEIVER CIRCUIT.

oscillating system is proportional to the square of the oscillating current. This result appears to show that the action of these crystals is not a valve action, but one in which the magnitude of the current flowing in the circuit depends on a thermo-electromotive force induced by the heating effect of the oscillating current

In series with the crystal was placed a high-resistance (8,000 ohms) telephone receiver, an ordinary Broca galvanometer with a period of about 9 seconds, and an Einthoven galvanometer with a silvered quartz fibre having a natural period of about 1/20 second when working at normal sensibility. In practice it was found that extraneous causes made it almost impossible to use the Broca galvanometer for purposes of mea-

The number of stations in the vicinity of Liverpool prevented any accurate observation being made on the shorter

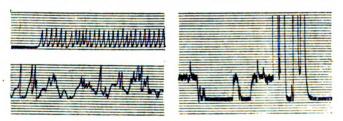

FIG. 2.—(a) PARIS SIGNAL—LOW-FREQUENCY SPARK; (b) CLIF-DEN SIGNAL—BAD ATMOSPHERICS; (c) BRUSSELS SIGNALS— SHOWING ATMOSPHERICS.

wave-lengths, and for this reason the work has been confined almost entirely to the wave-lengths used by Brussels, Paris, and Clifden.

In connection with each test a calibration of the crystal sensibility was made by means of the buzzer shown in fig. 1. In each case the current flowing in this circuit was measured by a Duddell thermo-ammeter, and the corresponding current in the galvanometer circuit observed.

The accuracy of the measurements of signal strength is not closer than 5 per cent., and too much attention should not be given to small variations or irregularities in the curves.

Several observations have been made at the time of sunset. The increase in strength of the signal does not occur at the time of sunset, but some time afterwards, almost the same time as daylight ceases, i.e., at the same time as the number of ions per cubic cm. in the atmosphere would rapidly diminish.

The curves show that the sunset effect varies with the weather conditions at the time of sunset.

The variations during a single night may be very large, and the difference in the ratio from day to day in any given month may also be large.

A possible explanation of the observed phenomena may be as follows: When the atmospheric conditions are bad and rain has fallen, the transmission is good, and the removal of sunlight, which is one of the chief causes of ionization in the atmosphere, produces little effect. Irregular reflections and refractions from masses of ionized air in the upper regions of the atmosphere, which cause irregular increases in the received artenna current, such as are observed in the all-night tests referred to later on, are prominent, because of the transparency of the lower atmosphere to the waves. On the other

hand, when the day is clear the received antenna current is less strong during the day, and when darkness falls there is a considerable strengthening of the signals, owing to the atmosphere becoming more transparent to the waves as it becomes de-ionized after daylight has ceased. The reflections from masses of ionized air in the upper regions of the atmosphere are less prominent, because of the less transparent condition of the lower atmosphere after a fine day than after rain.

One point of great interest in connection with the tests is that the signals sent out on 26th July and 27th October from the Eiffel Tower were measured at Nancy by MM. E. Rothé and R. Clarté. These results have been plotted for comparison with those obtained at Liverpool on 26th July (see fig. 3a). They found that the increase in signal strength was very slight. Here, on the other hand, it was very considerable, the antenna current received after sunset being nearly 1.5 times that received just before sunset. The difference in the time of sunset at Liverpool and Paris on 26th July is just about 40 minutes, whereas on 27th October the difference is less than one minute. On 27th October (see fig. 3b) there is some correspondence

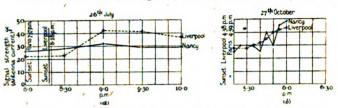

FIG. 3 —VARIATION OF SIGNAL STRENGTH AT SUNSET AT NANCY AND LIVERPOOL.

between the results obtained at Nancy and Liverpool, though there are considerably greater irregularities in the strength of signal measured at Nancy than are found here. It is difficult to see how these differences can be explained by the different orientation of Liverpool and Nancy in relation to Paris, and the consequent difference in the reflection and refraction at the shadow band. The theory of cloud reflection, however, may easily be applied to explain the difference in the effect observed at these two places.

observed at these two places.

There is throughout the year very little difference between the morning and evening signals. Mosler's results may be taken as giving some evidence that the maximum night

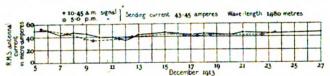

FIG. 4.—CURVE SHOWING VARIATION IN ANTENNA CURRENT RECEIVED.

strength condition tends to occur either earlier or later in January than it does in November or April. In view, however, of the fact that the variation during the night is so great, it is very difficult to base theories on Mosler's results. One may suggest that besides the conducting outer envelope which Heaviside and Eccles have postulated, there exists in the upper atmosphere a cloud condition which affects the transmission of electric waves of much the same character as the cloud distribution with which everyone is familiar, and which affects the transmission of light waves. These clouds may consist of the transmission of light waves. masses of ionized air which are transparent to light, but which absorb or reflect the long waves used in wireless telegraphy.

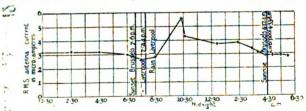

FIG. 5.-ALL-NIGHT BRUSSELS TEST.

From the fact that the signals observed in the day are less variable than those received at night, it is evident that this "electromagnetic atmosphere" is prevented from producing much effect during the daytime; it cannot, in other words, produce much effect until the de-ionization of the lower atmosphere by the withdrawal of sunlight makes it sufficiently transparent to enable the waves to pass through it and reach the cloud masses which reflect them.

The earth-transmission theory of Sommerfeld indicates that it is possible that the real factor in very long distance transmissions is the influence of earth or surface waves. The fact that the night strength is so variable, however, and that the From the fact that the signals observed in the day are less

that the night strength is so variable, however, and that the increase in signal strength on a fine evening occurs after some more or less definite interval from sunset, seems to show that the earth transmission theory cannot be a complete explana-tion of the facts. One must have recourse to changes in the "atmosphere" rather than in the surface over which the signals come.

It was noted in certain tests that there was a marked fall in signal strength when heavy rain fell in Paris, possibly due to defective insulation in the Paris aerial; but the constancy of the antenna current in Paris does not support this view. On several other days when it was raining in Paris the signal received was at full strength.

Speaking generally, the best conditions for wireless signalling are cloudy skies, except of course when there are strong atmospherical discharges in the clouds which make signal reading difficult. Records show that bright sunshine is not satisfactory for transmission, and this is borne out by the observations of operators, who have stated that during a spell of very tactory for transmission, and this borne out by the observa-tions of operators, who have stated that during a spell of very sunny weather their range appears to be very much restricted (this may possibly be due to large earth resistance). Looking now at the all-night record, fig. 5, it is remarkable that there appears to have been on the nights of 26th and 27th March and of 4th May a very considerable increase in strength

after rain

It would seem from this result that one of the causes of change in signal strength at night is rain. After the fall of rain the atmosphere becomes more transparent for the electric waves and allows the reflections already referred to, which cause an increase in the strength of signals, to become more marked; that this is possible is evident from the fact that a fall of rain must tend to de-ionize the air and carry down the charged nuclei on which rain-drops form, and which make the charged nuclei on which rain-drops form, and which make the air conducting and therefore absorbent.

air conducting and therefore absorbent.

In the plates giving records of the signals taken during the all-night run from Paris there is a very considerable variation in the strength of the signal during a 10-seconds' dash. At first sight it might appear that the explanation of this is that the sparking was irregular, but if these records are compared with those obtained with similar dashes sent out during the daytime, it is noticeable that the variation in strength is much greater at night, i.e., there will be during one second of the dash an increase in signal strength amounting to as much as 10 to 15 per cent. of the normal wave. The increase in strength may decrease or increase as the sparking continues.

These variations only emphasize the fact that changes in signal strength during the night are due to some rapidly fluctu-

signal strength during the night are due to some rapidly fluctuating influence such as might be expected to arise from the variation in form or composition of a reflecting mass of

vapour.

One may summarize the results of these observations as

One may summarize the results of these observations as follows:—

1. That between two stations lying nearly north-west and south-east of each other the strength of signals during the day-time varies within comparatively narrow limits.

2. That the ratio between the night and day strength varies with the time of the year, and also from day to day in any given month, as shown by Mosler.

3. That on a fine clear day the "sunset effect" occurs about 4 hour after the actual time of sunset and varies with the weather conditions. When rainy conditions prevail, the strengthening of the signal after sunset is much less marked.

4. That the amount of the sunset effect varies with the direction in which signals are emitted.

5. That there is very little evidence that between two stations, such as Liverpool and Paris, where the difference in longitude is about 22 minutes, there is anything in the nature of a dense fog which is opaque to waves, and which causes a drop in signal strength when the dark-light band lies between

the two stations.

6. That variations during the night are relatively great and occur within the space of a few minutes. The greatest increases in strength of signals have been observed after the cessation of rain either at the sending or receiving station.

7. That the character and extent of the variations in signal strength point to the conclusion that the main factor which controls the variations is the state of ionization of the atmosphere and that it seems likely that clouds of ionized air may phere, and that it seems likely that clouds of ionized air may exist in the upper regions of the atmosphere which act as mirrors for the waves and cause the sudden changes in signal strength that have been observed.

DISCUSSION AT LIVERPOOL.

Mr. B. HOYLE (Manchester School of Technology) referred to experiments carried out in order to ascertain the effect of frequency on crystal sensitiveness. Carborundum, which was requency on crystal sensitiveness. Carborundum, which was known as a definite rectifier of oscillations, and perikon and radiocite which were thermal in action, had been investigated and found to be very constant over a range of frequencies varying from 100,000 to 1,500,000 per second. Regarding the thermal action on low oscillating currents changing to valve action for large currents experiments, carried out by the thermal action on low oscillating currents changing to valve action for large currents, experiments carried out by the speaker had shown that up to 12 or 14 microamperes the ratio of current in one direction to current in the other was unity, but above this value the ratio gradually increased to 3 or 4 to one. The author had referred to the effective resistance of his crystal being about 32 ohms. The speaker's experience gave an average of about 18 or 20 ohms.

Prof. Marchant, in reply, said that Mr. Hoyle's experimental results on the dependence of sensitiveness of crystal upon frequency were borne out by the experiments of Dr. Lutege of Berlin. Many tests were made, and it was found that crystals which were good for low frequencies were good for high frequencies. It was to be remembered, however,

that the effect of frequency did not enter into the tests given in the paper. The value of the effective resistance of the crystal, given as 32 ohms, was a little uncertain as it was obtained by difference.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The Government Electric Power Station of Bangkok, Siam

Mr. Francis B. Shaw's description of the above plant in the Mr. Francis B. Shaw's description of the above plant in the ELECTRICAL REVIEW of November last is likely to lead to misapprehension, very much to the detriment of Messrs. Babcock wilcox. The reader would naturally infer that whereas the German firm (A.E.G.) had supplied a highly efficient plant, Messrs. Babcock & Wilcox had been so negligent as regards the boilers, that by a slight alteration 30 per cent. increase of efficiency in the boiler plant was obtained. In fairness to British engineering industry, I think a more complete history of this portion of the plant should have been given.

Messrs. Babcock & Wilcox tendered for a standard B. & W. form of step grate with fire bars that allowed the angle of inclination to be adjusted to suit the different grades of paddy, and the varying amount of moisture in the fuel.

inclination to be adjusted to suit the different grades of paddy, and the varying amount of moisture in the fuel.

After the contract was signed Messrs. B. & W. were asked by the A.E.G. to modify their furnace and to adopt a form of fire bar and furnace proposed by Mr. Shaw and his consulting engineer. This they did, but they strongly declined to accept any responsibility or guarantee for the same. On Mr. Shaw's own showing, Messrs. B. & W. were fully justified in their decision.

decision.

The B. & W. paddy husk furnace is illustrated in their well-known book "Steam," and several of these are in successfu

The B. & W. paddy husk furnace is illustrated in their well-known book "Steam," and several of these are in successful operation in different parts of the world.

This furnace has one great point, namely, the burnt ash falls directly into the ash drain, whereas in the Bangkok design the fireman must rake the ash forward some four feet or more—no light task. Probably this accounts for the suggestion to use steam (page 661) for the removal of the ash, a scheme that has proved unsuccessful and dangerous to the fireman elsewhere. The air channel (page 659, fig. 7) is, of course, quite an old idea, being used in the Bangkok tramway station built some ten years ago, and also adopted by nearly all the Bangkok rice mills. To admit the air through the top of the bridge is surely nowadays a proven fallacy.

nowadays a proven fallacy.

It is rather a pity that Mr. Shaw has omitted to give some figures or readings from the CO₂ recorder and the Lea water

recorder.

Just recently it appears the furnaces have been rebuilt somewhat on the lines indicated, the bridge being hollow and porous. Tests carried out in December, 1914, on behalf of the Government, under careful supervision, show that the fuel consumption of the new furnaces is much below that of the furnace shown in fig. 7. Some modification in the ironwork of the furnace was made, and, I believe, the angle of the fire bars was increased slightly.

It is interesting to note that a British firm of gas engine makers have just installed in Bangkok a suction gas plant using paddy as fuel, with great success. Possibly gas-fired boilers on a similar system would prove to be the ideal method

boilers on a similar system would prove to be the ideal method

of steam raising.

I believe that Mr. Shaw has been absent during the greater pertion of the erection of the Samsen station, otherwise he would have been aware that more or less serious subsidence of the building took place, the chimney tilting over to an extent plainly visible to the ordinary observer. The method adopted by the Government building engineers to get over the adopted by the Government building engineers to get over the trouble was most ingenious. A trench was dug alongside the battery-room wall, extending somewhat at the chimney end, and carried down well below the foundations. This allowed the earth under the foundations gradually to squeeze out, so that the lightly-loaded side of the building could settle down to the same level as the boiler-house side. After some six or eight months it was found that the building had gradually gone back into level, and the trench was then filled in, all the machinery being again carefully put into alinement.

The contract for the whole of the plant, boilers, generators, switchboard, and sub-station equipment (excluding conveyers and buildings) was placed with the A.E.G., of Berlin, whose tender was very much below that of English firms. It would be interesting to know the exact detailed cost of the plant, including extras, as according to the Government Finance Returns, this power station has cost nearly three times the sum

turns, this power station has cost nearly three times the sum originally estimated, while the maximum (peak) load appears to be under 500 kilowatts with all lines in service except the

cement works, now building.

Who is responsible for a 4.000-kilowatt station being put down; surely the load does not justify the size of plant (135.000 units per month)? Is this a sample of Germans engineering advice?

I have no connection with any of the firms tendering, and I have no connection with any of the firms tendering, and enclose my card; I strongly advocate a more active attempt to secure British trade in the East. I think more care should be taken by British firms to obtain information as to the exact state of affairs so that they are not intimidated by heavy penalties for delay and failure of supply into inflating tender prices to cover these risks. The German firms know full well the risks are small and easily circumscribed.

H. E. F.

H. E. F.

January 4th, 1915.

The Capture of German Foreign Trade.

I do not know with what object "Galvo," of New Zealand, writes to you with respect to British trade, but should judge that it is done with the idea of damaging it; but it is easy to see from his statement "that Geelong is a small and rather insignifiant inland town in Victoria," that he is both ignorant and careless in his statements, and it can therefore be gathered that the rest of his highly-coloured statements, if not actual

untruths, are certainly exaggerations.

For those few readers who may not know the district, Geelong is one of the four largest towns in Victoria, and is situated on the shore of Port Phillip Bay. It has a first-class electric light station, automatic telephones, and a large over-sea trade

in wheat and wool.

We have read with interest and amusement the two columns of "hot gas" contributed to your issue of February 5th by a New Zealand correspondent signing himself "Galvo." We think we know this gentleman, in fact, we are sure of it, because the "story" which is retailed at the top of page 171 obviously relates to us. We have no brief for the other offenders, so will merely state that when reading all cases of this kind one should remember the Latin proverb audi alteram partem. There is generally something to be heard on the other side, and to judge from our own experience, we should say that the other alleged offenders will be quite well able to offer a satisfactory defence. Without going into details, we may say that it is quite true we guaranteed our plant. In doing so, we assumed that our verbose friend would erect it as we should have erected it. We have no knowledge that he did so, because he has never, in spite of repeated letters, given us all the particulars that we asked for, and we do not know that he carried out the original job as instructed. Nevertheless, when he complained that the plant would not do its work, we told him to do so and so, and as a result the plant was centred. work, we told him to do so and so, and as a result the plant was accepted. He then made a claim on us for a considerable sum of money, which he said he was out of pocket of, and we had no difficulty in showing him by a little arithmetical calculation that he was trying to "have" us. We, however, offered to meet him in this way. We said that we would credit him with a certain smaller sum by considerably increasing the discount we allow off our goods until this sum was paid off. He hen replied that he would accept the smaller sum in cash with a certain smaller sum by considerably increasing the discount we allow off our goods until this sum was paid off. He then replied that he would accept the smaller sum in cash, but not in kind, because the original goods we sent him, apart from the installation in question, had proved unsatisfactory. We were able to give him documentary proof that he had continued to order further goods in spite of the alleged unsatisfactory working of the original goods, and we said that if he would send the original goods back we would see that they were repaired, brought fully up to date, and returned to him. We thought this a very fair offer, but he has only replied by stating that he has put the matter in his solicitor's hands. Although our friend did not send us the full information we required regarding the job in question, he has always had a great deal of time for the writing of yards of facetious and sarcastic letters on all sorts of subjects, similar to the one you published, and we have often thought that he was more fitted to edit a Bush journal than to trade as an engineer.

Some of these Colonial engineers and merchants have seen nothing of the world, and always appear to look on their demain as the hub of the universe, and they forget that Great Britain supplies the world, whilst Germany and America have made it their business to try and cut her out. No doubt we have our faults, and one is insularity, but "Galvo's" letter

made it their business to try and cut her out. No doubt we have our faults, and one is insularity, but "Galvo's" letter reminds us that New Zealand is a very much larger group of islands than Great Britain and only has a population of about one million.

In conclusion, if this correspondence meets the eye of the firm who supplied "Galvo" with the marble, we should be glad if they would communicate with us through you.

British Specialists.

Salaries of Junior Engineers.

Referring to your Correspondence column of the 29th January, regarding "Collar and Cuffs" statement comparing engine drivers with shift engineers, I should like to know what central stations he has been employed at to be able to condemn the engine drivers and stokers for obtaining a better position any more than the volt boy that wipes the engines down in his spare time or the office lad that is learnthe switchboard. After about twelve mention they begin the switchboard. After about twelve months they begin to feel their position, they get a shift engineer's job, know nothing, relying on the men under them to pull them through; then why not let those drivers or stokers that have their jobs at their finger tips qualify for the same if interested in their

I am glad to see one or two have gained this position work? work? I all glad to see one of two have gained with protein the last few months. The station superintendent's assistants, in my opinion, are the drivers and stokers in a great many of the provincial towns regarding the generating cost, and a good many know that. I will give you one or two instances of the provincial towns regarding the generating cost, and a good many know that. I will give you one or two instances in my fifteen years' experience, in central stations as driver, stoker and switchboard attendant. In one station I was leading stoker; it happened one night they could not get on the battery, so the shift engineer had to run a small engine and boiler all night. This engineer was about 26 years old, and had been there two years. Everything went all right till 3 a.m., when his water got out of sight; then he came for me, living next street. I told him to shut his top cock on the water gauges and if the water did not rise in glass to pull the fire out at once; if it was all right to put his pump on a bit more—he would soon gain water—but to let me know if he was all right, to save me getting up at that hour, being on till 11 o'clock. So he went along on that, but in the morning about 8 a.m. I walked into the boiler house and there was the gauge cock still shut off, showing about half a glass, which he had been working to, so you see when I opened the cock it was the same, so I explained the working of the steam and water ways of the gauges and got his water up. I wonder if he has got a Chief's job yet. I saw a great many changes, but the majority of them were like the steady driver, did not know the firebox from the ash pit. Another job, they happened to have two boilers to pieces for cleaning leaving one to work on. It being summer-time I happened to have a day in the country that Sunday, as he said the fitter's mate could do that, but when I got home at 10 p.m. I was told the lights had been out since 7 p.m. They had blown some of the water off on Sunday morning to repair a valve, so they started the fires roaring about 6 p.m. as the battery was low, without putting any more water in the boiler. This could have been prevented if they had had an experienced engineer to see things right before starting fires up, but they preferred burning the tubes, roaring about 6 p.m. as the battery was low, without putting any more water in the boiler. This could have been prevented if they had had an experienced engineer to see things right before starting fires up, but they preferred burning the tubes, so there were no lights for two days and nights through neglect. Another shift engineer had a joint to make on 1½ in. steam pipe, got it adrift after a struggle, cleaned it, put new joint in; four studs held it, but to make sure it would not blow, being a new man, he tore two of the studs off, so it blew worse. Then he gave it up and the fitter did it. Next job, packing the gland of a one-inch valve with asbestos string, winding round on top of the brass bush instead of pulling it out and stuffing inside; this man had been in two other central stations. It does open the eyes of drivers and stokers that they have charge of on shifts. Arother shift engineer I know was on the day and night shift for twelve months because he could not run two alternators in parallel. The same gentleman got a chief assistant's job from that. I should like to know what kind of engineers you call these. Good practical shift engineers are few and far between, so are drivers and stokers, as they get no encouragement at most places. I should like to hear how those drivers that have gained that position are getting on—I don't think for one minute they are grey-headed.

Driver,

Late Steam Generating Regimer

Driver,

Late Steam Generating Engineer.

Wonderful Accumulator Cells.

In reply to Mr. Faraday Hawdon's latest favour, I would simply refer him to his previous letter in which he kindly informs us that no lead type of cell can work without sulphate. Very well. This is a flat contradiction to the Notice to which I diew attention, in my original letter. As Mr. Faraday Hawdon has expressed a wish to close this correspondence, I think it best to leave him with his truly "Wonderful Accumulator" in which "the plates are free from sulphate" after being totally discharged ten months ago.

A. W. B.

[It appears that this discussion arose out of a quibble. The merest tyro in accumulator work knows that "sulphate" in this connection has two meanings.—Eds. Elec. Rev.]

Consulting "Engineers."

I think "Delta" touches upon a point of great importance. If an individual attempts to practise as a lawyer or medical man without first qualifying, he is immediately imprisoned

man without first qualifying, he is immediately imprisoned or heavily fined.

Why is it our profession is not equally so guarded? I know of a commercial traveller who has actually had the audacity to fix a brass plate outside a suspicious-looking box-room in the City. There are a large number of these little rooms occupied by similar quacks, etc., the whole block is generally known by a high sounding name, and Fleet Street, Regent Street, or Queen Victoria Street, completes the tools-in-trade as it were, not to mention the illusion of the intending client. But let me proceed—this individual I have in mind has by some means or another become an associate of one of our

But let me proceed—this individual I have in mind has by some means or another become an associate of one of our leading institutions.

Now, Sir, what protection, I ask, have genuine engineers against such a state of affairs? We are actually faced with our well-known institutions aiding and abetting quacks, wheats are by the fact that these wasters are admitted. cheats, etc., by the fact that these wasters are admitted as members to these institutions, whose very existence should

guarantee the bona fides of its members. I think this is a case the Review should take up. At present the letters A.M.I.E.E., M.I.M.E., etc., sound ridiculous and foolish to many, and afford no guarantee of a member's competency.

Let us hope that such letters will in time convey the same sense of security to a client as M.D. or K.C. do to

Station Engineer.

Extra High-Tension Cable.

At several meetings recently held to discuss the above subject, suggestions have been made that a pressure of 30,000 volts should be the working limit of underground cables, and I believe this proposal was made by a representative of one of our leading cable firms.

If this view be taken by the remainder of the cable manufacturers, it will amount to an admission that we cannot tackle facturers, it will amount to an admission that we cannot tackle the larger stuff, and that we are lagging very much behind the Continental cable makers. The writer recently saw a consignment of 40,000-volt 3-core cable (50 sq. mm. section) lead covered and armoured at the works of Messrs, Pirelli & Co., Milan (this cable was made for the Italian State railways), the lead and armouring being 24in, and 3 3/16in, respectively.

As pointed out by Mr. D. A. Starr, at Glasgow, Dr. Borel does not pin his faith to pure manilla paper, but prefers a paper with a proportion of wood pulp. This view is also held by many other Continental cable makers, and one is bound to admit that they do know something about cable.

Recently an inquiry was set afoot for a cable of about the size mentioned above, for a working pressure of 50,000 volts, and I learn that the business was turned down because the size of the cable would be too large to put through the lead press. A lead press will take up to about 34in.; what amount of insulation was proposed in this case?

H. H. E. Wood.

H. H. E. Wood.

Hampstead, N.W., February 16th, 1915.

OUR LEGAL QUERY COLUMN.

"ELECTRIC" writes:—With reference to your answer to my query in your issue of the 5th inst., I may mention that there was an agreement for the three years, but "light" was not mentioned in the same. The point was "whether a tenant having put in electric light wires in tubes could have legally taken (drawn) them out again without liability to himself, and leave switches which he would have to disconnect to do so?"

*A*The duration or length of the lease does not appear to affect the question under discussion. It is clear law that if a tenant affixes anything to the freehold it becomes the property

of the landlord and cannot be removed at the end of the lease.

If a tenant has a fancy for a marble chimney-piece, and puts one in, he makes a present of it to his landlord. With wires laid for the purpose of distributing electric light the principle is exactly the same. Anything that unscrews may of course be removed, but things which are fixed cannot be taken away. taken away.

"H.C.M." writes:—"My committee have recently had a case of a consumer claiming to utilise his motor service for the purpose of driving a dynamo for lighting his workshop. This dynamo would be driven from the workshop motor and he claims that our department have no right to stipulate as to the way in which he should use any surplus power that he may have from his motor, the main object, of course, being to obtain current for lighting at power rates. I have some recollection of your publishing articles on this subject, but I cannot give the dates. Will you therefore please let me know whether your files show any decision of the Courts on this matter, or could you forward me issues containing the information?"

***This question has been frequently propounded. There

mation?"

**This question has been frequently propounded. There has never been any judicial decision on the matter, and the answer must be based on first principles. The use of the word "power" or the words "power rates" in Acts of Parliament is now very common, and even the man in the street could say what is meant by a "power" Act. Then, too, the word "lighting" or the expression "supply for lighting purposes" is perfectly well understood, and it is obvious that a man who takes current at motor rates and uses it to run a motor generator and then to light his lamps is doing something which is very like defrauding the supply company. A supply for power can be given at cheaper rates for the reason that "power" is generally wanted during the day, when the normal lighting load is small. Hence that reduction in charges which is of such advantage to the manufacturer: but the electric lighting company or local authority supplying electric light would be deprived of a large part of its revenue if the practice referred to were often adopted.

It is interesting to notice that, although the matter has not hitherto been dealt with in any Act of Parliament of general application, those who were responsible for certain legislation

application, those who were responsible for certain legislation

applicable to London were fully alive to the difficulty which might arise, and have provided against it—first by defining "power," and secondly by imposing penalties on those who do the very thing referred to in the query.

A statutory definition of "Electricity for power purposes," which, of course, only applies to the Metropolis, is to be found in Sec. 7 (1) of the London Electric Supply Act, 1908. That section provides that "No authorised undertaker shall be bound to give a supply upon the terms of this section in any case where the maximum power required to be supplied is less than two kilowatts. For the purpose of this section the expression 'power purposes' shall include all purposes to which electrical energy may be applied other than for use either directly or indirectly for lighting."

By Sec. 7 (4) of the London Electric Supply Act, 1908 (8 Edw., 7 c. clavii) (which is an Act of restricted application), it is provided that: "Any supply given for power purposes... shall, if required by the authorised undertaker, be measured by a separate meter or other apparatus, and any person receiving

a separate meter or other apparatus, and any person receiving a supply for power purposes who shall use the energy directly or indirectly for the purposes of lighting shall be liable to a penalty not exceeding five pounds for every day on which he uses such energy for such purposes, in addition to the sum payable for the energy so used at the price charged by the authorised undertaker by whom the supply is given for a supply for lighting purposes."

ighting purposes."

These statutory definitions are not, of course, binding, except in the area to which this Act relates; nor do they throw much light upon the way in which the Court might interpret the word "power" under other circumstances. Nevertheless, the insertion of the words "directly or indirectly" before "for lighting" shows that the Legislature had in mind a method of driving a coach-and-four through an Act of Parliament by using a motor-generator.

"H.K." writes:—"I should be very glad if you could help me in the following matter:—A, B, C, D, E, F, are a block of shops in a row, and to give a supply to the (E) a pair of temporary wires were run behind the facias of C and D from a point behind C for a period of five days, when permanent service was put in at E from the mains opposite the house. The landlord's permission had been obtained to lay service as before. Shops A B have permanent services run behind the facias, and the main supply is at a point behind C. C's and D's permission was not obtained to the running of the temporary wire. C did not object, but D objected after wires were fixed and wanted them moved at once. This was not done, as E would have been cut off. The circumstances were explained to him, and he was told wires would be removed. D now claims compensation for trespass, trouble and annoyance. As the wires were not attached to his facia-board, can he claim anything? If so, what would he be entitled to?"

**It is plain that if a man owns or occupies a house, he is entitled to prevent any form of trespass thereon, whether the trespasser comes on the land himself or places any of his goods or chattels thereon. So to run a wire across a man's back garden (whether it be attached to his walls or not) is clearly

garden (whether it be attached to his walls or not) is clearly a trespass for which an action lies. But it is difficult, in the present case, to see what damage D has sustained. If he brings an action let 40s, be paid into Court, and probably no more will be heard of the matter.

ELECTRICAL PATENTS OWNED BY ALIEN ENEMIES.

The following contains a list of British patents applied for by persons resident in Germany, Austria and Hungary, and will be found to be of particular interest in view of the new Patents Act. This list is specially compiled for the ELECTRICAL REVIEW by Messrs. W. P. Thompson & Co., of 285, High Holborn, and 6. Lord Street, Liverpool, from whom any further particulars may be obtained by manufacturers or others desiring to obtain a compulsory licence.

Income-Tax.—At the annual meeting of the West Yorkshire Federated Chambers of Trade, at Leeds, last week, Mr. Thomas Pratt, head of the firm of Chr. Pratt & Sons, Ltd., electrical contractors, of Bradford, who was re-elected President, delivered an address on "The Income-Tax and its Exemptions," as a result of which the Federated Chambers decided to support the resolution to be considered by the National Chamber, "That in view of the enormously increased expenditure in recent years in local and national government, and the heavy burdens upon traders added by the war, this Chamber strongly affirms its opinion that the incidence of rating should be altered, and the basis of taxation broadened, and suggests that the limit of £160 per annum liability for income-tax should be lowered to £80.'

NEUTRALITY AND THE MORAL LAW.

THANKS to the labours of the pre-historian and the historian, we are able to trace with tolerable accuracy the path along which mankind has advanced both in his material and his moral development.

Some fifty thousand years separates the civilisation of palæ lithic man from that of to-day, and the advance made during that period in man's knowledge of material things, and in the sphere of morals, has been immense. In the earlier part of this period the rate of progress was slow owing to the sparse distribution of the population and the difficulties in sustaining life. During the last few thousand years, however, the physical and mental environment of man has changed very rapidly, and this change in environment has in itself provided an atmosphere congenial to the birth of new ideas.

One of the chief factors in promoting progress has been the increased intercourse and co-operation between the various sections into which the human race is divided. New and rapid means of travel and communication have been created, systematic education has become general, and a daily interchange of ideas now sweeps freely over every quarter of the globe.

Our world has at once widened and contracted; it has widened, in that our knowledge and interests now extend to the utmost confines of the earth, and it has contracted since our thoughts and acts may now be known throughout the world almost at the moment of their birth.

This transformation, wrought largely by the magic of the engineer, has had, and will have increasingly in the future, a vast influence upon the moral as well as upon the material progress of mankind.

We can trace in the past the effect of the progressive widening of the mental and material horizons on the moral and material progress of the race.

These horizons were very restricted when the family of the nomud hunter formed the collective unit, they widened slowly, as first settlements, and then peoples, and nations came into being, until to-day, with our world-wide horizon, we are awakening to the consciousness of the unity of our Race, and feel within us the pulsing of the heart of Humanity.

In the material world the achievements and advances gained by man in his struggle with Nature have become the common property of the peoples of the earth, and in like manner, in the sphere of morals, a common store of ideals and moral obligations has been built up.

In this day of thunderous stress, amid the clash and shock of material conflict, it is difficult for us to realise as clearly as we should do, that the real issue that is being fought out in the bloody mire of Flanders and the stained snows of Poland is not a material one; it is a conflict between human ideals, the result of which will determine for many centuries to come the moral progress or retrogression of our race.

To what end is this fearful flood of blood and destruction poured out, sweeping away with it the hallowed sanctuaries, the garnered treasures, and the sweet amenities of a Continent, annihilating the spirit of its past, blasting the promise of its future and bringing woe and life-long tears to millions of our fellow men? In two words, it is as to whether Force or Freedom is to govern the future of our race, whether brute force is to be king, or whether the right of humanity freely to follow its ideals and the dictates of the Moral Law is to be paramount.

The German people, under the influence of its teachers, philosophers and military leaders, have come to believe in the Gospel of Force, and to think that the laws of Force govern the moral and material progress of mankind. There does not appear to be any sound biological basis for such a law when applied to mankind. Huxley showed us more than a generation ago that Man can, and does, cut athwart the laws of purely natural development, and that Nature "red in tooth and claw" is not only faced, but is mastered, by the spirit of Man.

Man is shaping his destiny in accordance with spiritual laws, he sets up a standard unknown to Nature, and one which it is beyond the power of Force to overwhelm. Whatever the ultimate fate of the race may be, there is no mistaking its present duty, the call is clear and high.

What of the response?

The Teuton peoples fight for the right of Might; the Allies fight for Freedom; and the rest of the world is "Neutral." Neutral they may be so far as active participation in the material conflict is concerned, but what neutrality can there be in connection with the moral issues of the

struggle?

It is evident that the material concerns of certain peoples are more closely involved in the present strife than are those of other nations more remote from the scene of conflict, but the moral issues indubitably and intimately concern the whole of the human race. For these issues the attitude of "neutrality" can only be a negative one, a passive waiting for the decision of the issue by others, and a flaccid acceptance of the ideals of the victor. Do the "Neutrals" recognise that their wills are only temporary manifestations of an ampler will, that their lives are passing phases of a larger life; if they hold themselves aloof, can they hope to wear the Crown Divine, the harvest of our blood and tears?

America should know; for Emerson has taught her that every spirit builds itself a house, and beyond its house a world, and beyonds its world a heaven, but only what she herself is can she really know and see. Is she prepared to sit silent and inactive in the land of Freedom while the world-building is done by other hands?—is the chinking of the almighty dollar so loud in her ears as to drown the still small voice of the All-Father of her race? We trust not, we think not, but she, with other "Neutrals," would do well to ponder the moral obligations they took upon themselves at the Hague in 1907 and to prepare to discharge them, for they still await discharge.

If we are to entertain any hope of the elimination of military domination in the near future, such hope can only be based upon the collective action of the race in the present crisis. The solemn obligations accepted by the Powers signing the Hague Convention must be upheld, must be discharged, or the Powers concerned must for ever be marked with the stigmata of dishonour and the brand of cowardice.

What shall it profit a nation if she gain the whole world and lose her own soul?

Copper.

THERE has been a continued and sustained demand for copper from the consuming trades, alike in this country, France, and the United States, and there has not been any yielding in the position of the leading producers, who have of late made such substantial sales that they are in a pretty comfortable position for some weeks to come. That a considerable amount of confidence is felt that the domestic trade across the Atlantic which has been in a languishing condition for a long time . . . a condition which is far more responsible for the complaints made as to the miserable state of

the United States copper trade than is the British declaration that copper is contraband . . . is on the eve of solid improvement, goes without saying. It is high time that there was an extension of business enterprise there, and some signs of the stirring of the dry bones is indeed perceptible already. There has been a certain amount of reawakening of interest in the Stock Exchange in New York, and this usually betokens that the keener-witted element has scented something moving, and in view of the long depression it is out of the question that there should be any further contraction in the tonnage of general business passing. The European War has released immense orders for the British, French, and other allied Governments, which have put many branches of United States industrial effort upon a more active basis than has been experienced for years, and there can be no let-up in this direction until the Huns are finally smashed and their powers for further evil utterly demolished for a century to come.

Naturally, coming on top of a curtailment of production estimated at 50 per cent. of the refinery capacity, copper has sustained a considerable advance within recent weeks, and is still firmly held at about the top figures, but the price is now sufficiently advanced to stimulate production, and accordingly it is no matter for surprise to find that many of the largest mines in the United States have resumed normal working, and that others are following suit in all directions. The process of output restriction has indeed ceased to exist so far as the Lake Superior mines are concerned, and production has assumed an entirely normal appearance. This can only be the prelude to easier market conditions for copper sooner or later, for there can be no question but that it pays handsomely to turn out refined metal at round current selling prices. For this reason there is a disposition to take a rather conservative view of the future, and consumers have lately been only buying in strict relation to their needs and to the prosp-ctive orders. The immediate position seems to be firmly established enough, but excessive optimism as to the situation of prices might be unwise as regards the second half of the year.

Trans-Continental Telephony. CONSIDERABLE space has been devoted by our American contemporaries to the triumphant achievement of telephonic communication between San Francisco, on

the Pacific coast of North America, and New York, Boston, and Washington on the Atlantic sea-board, a feat upon which they are entitled to our hearty congratulations. A specially noteworthy feature of the occasion was the fact that Prof. Alexander Graham Bell spoke with Mr. T. A. Watson over the 3,400-mile line, these gentlemen having been the first to hold conversation with the telephone invented by the former in 1876; moreover, they successfully used Dr. Bell's original transmitter for this purpose, and we cordially congratulate the inventor upon being privileged to witness this magnificent consummation of his popering work of 49 years ago. What would Faraday have said if he could have seen a modern 25,000-KW turbo-generator, the gigantic off-pring of his creative genius?

The credit for overcoming the many engineering difficulties met with in the construction of the int-roceanic line is ascribed to Mr. John J. Carty, chief engineer of the American Telephone and Telegraph Company; the commercial problems of finance and organisation were dealt with by Mr. Theodore N. Vail, president of the company. Some particulars of the line are given elsewhere in this issue. It is interesting to note that by special connections to the home of Mr. Vail, conversation was successfully carried on viâ Boston over a total distance of no less than 4,750 miles. We must not omit to mention that the feat was rendered possible by the use of the loading coils invented by Prof. Michael Pupin, of Columbia University, who, we have no doubt, would readily admit his indebtedness to the mathematical researches of our fellow-countryman, Dr. Oliver

Heaviside, in this connection.

HAND REGULATION OF A HYDRO-ELECTRIC PLANT IN INDIA.

By J. W. MEARES.

In these days of automatic regulation, distant control, and so forth, it may be of interest to readers of the ELECTRICAL REVIEW to hear of a water-driven power station which has for years been regulated entirely by hand, without

The plant in question is at Darjeeling, the hill station of Bengal, and the summer headquarters of the Bengal Government. The original installation was laid down by the present writer in 1896, on behalf of Messrs. Kilburn and Co., in pursuance of an agreement with the municipality. It consisted of two 65-kw. Crompton-Brunton single-phase alternators, driven by Gunther Girard turbines. Soon after completion a disastrous flood caused a landslide which dammed up one of the two hill torrents which supplied the power, with the result that the power station was buried in mud over the top of the machines. They were excavated, however, washed and dried, and set to work again some few weeks later. These 2,300-volt generators are still working, and as an old Cromptonian I feel rather proud of

The present municipal engineer, Mr. G. P. Robertson,* M.I.E.E., M I.Mech.E, took over charge in 1903, and under his able management this small plant has been extended from time to time, and has paid very well indeed. Incidentally, he adopted a "point-five" tariff for the winter heating load many years ago—earlier, I think, than our friend, in Great Britain. From the very beginning, even before the mud episode, the hydraulic governors were very troublesome; they were not of a type calculated to assist in the parallel running of alternators, and they never recovered from the shock of being buried alive.

From this point I prefer Mr. Robertson's report, on the

extension now contemplated, to speak for itself.

"The governors on the old machines gave so much trouble that they have been scrapped, and the machines are being controlled by hand. One of the difficulties was grit getting into the governor-controlled valves of the hydraulic Oil-pressure gear was, therefore, specified for the new turbine, and the governor supplied acted splendidly for One day, however, the machine started hunting so violently that it had to be shut down, but when opened out again it ran as smoothly as if nothing had happened.

"Some time afterwards I was in the power house when

the same thing occurred again. I then thought that the effect was due to an electrical surge of such a nature as to set up mechanical pulsations, synchronising in some way with the surge, so that the machine was nearly hammered

to pieces before it could be shut down.

"I made inquiries about this while at home this year, and heard of several similar cases, though very little is said about them. One man explained the case as being due to harmonics; he admitted that similar cases had occurred in Switzerland, and doubted if any governor would keep control in the circums ances. The governor may act like a trol in the circums ances. charm for years at a time, taking care of all kinds of lightning and switchgear surges; but one day, for no apparent reason, the machine starts to hunt, sometimes with disastrous results.

· The machines at Sidrapong are now being run successfully without governors. A tachometer has been fitted to each machine, and a machine coolie stands by with his hand on the control wheel and his eye on the tachometer. His whole job for four hours at a stretch is to adjust the control wheel so that the techometer pointer is always against a red line on the dial. He does this splendidly. An educated man would probably either smash up the machine or go to sleep before the end of the four hours, but the job neither worries nor bores the coolie. arrangement for the new plant." I propose to adopt this

I may add that we are fortunate in having no Trade Union to object to the employment of what may, perhaps, be called the "Coolie automatic voltage regulator," a type

[* Mr. Robertson's regrettable decease is announced in the following article.—Eds. Elec. Rev.]

which is not described in Mr. C. C. Garrard's recent paper The cost of each regulator of this type is on the subject. Rs. 10, or, say, 18s. 4d. per mensem, and no repairs are necessary—not even a "little bit of string" is required to prevent them being too sensitive.

INDIAN NOTES.

[FROM OUR SPECIAL CORRESPONDENT.]

Allahabad and Lucknow Electric Lighting Schemes .-"Residents of Lucknow and Allahabad," says the Pioneer, "have heard so much of electric schemes that have come to naught, that they might be excused perhaps for feeling somewhat sceptical on the subject of the possibilities of electric lighting for the two capitals. It appears that an important new development in the carrying out of the much canvassed scheme has recently taken place. The licensees, Messrs. Crompton & Co., have been given guarantees by the two municipalities concerned of 41 per cent. per annum on the paid-up capital required—a sum amounting to $15\frac{1}{2}$ lacs of rupees (£100,000). The arrangement arrived at is that the municipalities are to share all the profits above the $4\frac{1}{2}$ per cent. guaranteed for the seven years' period of their guarantee—the licensees anticipating that the concerns will pay at least 8 per cent. after three years' working. If this auticipation is realised the municipalities shoud do well on the deal. It is proposed to form a limited liability company, under the Indian Companies' Act, with the well-known firm of Messrs. Martin & Co, of Calcutta, as managing agents, the capital to be raised in India, and residents of the two towns being given an opportunity of taking shares in what is expected to prove a profitable investment.

"It is also, it may be mentioned, anticipated that when the supply of electric power is available, an additional demand is more than likely to arise in the way of small industries, which are wont to spring up where electric power is obtainable. The ideas of the promoters of the present scheme are, we understand, not confined to meeting the wants of the wealthier classes only; arrangements are to be made to install lumps in bazzar shops, the tenants to be charged a flat rate of a few annas per lamp per month."

The above has been taken from a recent article in the Allahabad Pioneer, an I it gives ome idea at to how matters stand regarding the proposed supply of electricity for lighting and power for the two cities mentioned. With regard to Lucknow, the residents may well indeed be sceptical, as there have been at least half a dozen schemes drawn up and discussed within as many years The authorities, bo h civil and mil tary, must have sheaves of estimates pigeon-holed somewhere appertaining to an electric supply: and, incidentally, the hotel-keepers of Lucknow must be a good deal in pocket, through the sums spent by the representatives of various contractors in Calculta and Bombay who have been periodically invited, or, rather, seduced to Luck-now to draw up est mates, which, being sent to the authori-ties concerned, after much trouble and great expense, were not even acknowledged -a want of courtesy which, by the way, is characteristic of Indian methods.

It is reported that a wealthy Indian has promised to subscribe 7 las (£50,000) for the Lucknow scheme if the municipality consent to give his name to the undertaking.

Calcutta Electric Supply Corporation, Ltd .- I'he consulting engineers of this prosperous company in London have recently given a contract to the British Thomson-Houston Co., of Rugby, for a 6,000-kw. set—the largest steam turbine set out East -for the new Cossipore power house, Calcutta.

The present plant consists of four 3 000-kw. Orrlikon steam turbine sets, one 800-kw. ditto, and four 500-kw. Belliss sets; the supply is at 6,000 voles, 50 periods, transformed at several sub-stations to 450 volts directcurrent three-wire, and covering an area of 109 square miles.

Darjeeling. - The death is reported through drowning of the popular and very able municipal electrical engineer, Mr.

G. P. Robertson. He recently spent a period at home and on the Continent, inquiring into the most recent and modern improvements in long-distance hydro-electric transpractice, and on his return to India was mission deputed to survey and develop a further scheme for the Darjeeling extension electric power system. It was while actively engaged in this operation that he recently met his end by his boat being capsized in the Rungeet River. He was an extremely able and energetic engineer, and a hardheaded Sco:sman, whose advice and guidance will be sadly missed by the Darjeeling municipality. Besides being electrical engineer, he was in charge of the sanitary, drainage and buildings department of this flourishing municipality, and his work in each of the departments attest to his all-round capabilities.

CONDITIONS AFFECTING THE VARIATIONS IN STRENGTH OF WIRELESS SIGNALS.

THE paper read before the Institution of Electrical Engineers by Prof. E. W. MARCHANT, and abstracted in our last issue, s discussed in London on F-bruary 11th.

MR. W. DUDDELL, in opening the discussion, said the paper raised many questions, but he would confine himself to the problem of many questions, but he would contine himself to the problem of measurements, because insufficient results had been obtained to enable satisfactory conclusions to be arrived at as to the discrepancy between day and night signals. He referred to the necessity for organised observation over a wide area, pointing out that the programme discussed in Brussels for making such measurements, which had been abandoned owing to the war, showed the difficulty of keeping constant conditions of measurements in different places. He took issue with the author as to whether the Einthoven calvangments was so sensitive as stated. Lately the Einthoven galvanometer was so sensitive as stated. Lately Abrahams had constructed an improved moving coil galvanometer in Paris, which was quite as sensitive as the Einthoven instrument, and it was evident that we were on the point of obtaining a suffi-ciently sensitive instrument to record long-distance measurements. Mr. VYVYAN, who apologised for the absence of Mr. Marconi,

mentioned that some long distance records of night signalling had been obtained from Melbourne, ship to shore and rice tered, covering 2,000 miles with a 1½-KW. set, which was the greatest distance obtained with such a set. It was difficult to come to any conclusions as to conditions, &c., without some organised system of

collaboration, extending over a period, for making observations.

DR. W. H. ECCLES thought the most useful feature of the paper would be the details of the use of the Einthoven galvanometer, especially when organised measurements could be made. In the Pacific it was found that with a 2-kw. wireless set it was normally possible to communicate over 2,000 miles at night, and freak possible to communicate over 2,000 miles at night, and freak signalling in the summer had been established over 3,000 miles and 3,500 miles in the winter. In the day the possible range was only some 200 miles. Dr. Marchaut was only getting one-tenth of the variation that was being obtained in Pacific work. For short distances the upper layers of the atmosphere probably had little influence on the result, but it was otherwise in long distances. In wet weather, the loss of insulation increased the damping effect, and might account for 20 to 30 per cent. difference in measurements.

Mr. J. E. TAYLOB said as regarded the theoretical assumptions as to causes of varying strength of wireless signals, he had little belief in any of the speculative theories put forward, particularly in regard to ionised air, &c. He suggested that the antenna had superimposed on its own field another field due to the atmospheric superimposed on its own neid another neid due to the atmospheric potential grade, which had the effect of greatly increasing the field in an upward direction, and this gave rite to radiation at a high level much above the normal. As the range increased defraction due to low level radiation would sift out, but the high level radiation would persist.

ADMIRAL SIR H. B. JACKSON thought the Pacific would be an axcellent area in which to experiment on account of its numerous

excellent area in which to experiment on account of its numerous small islands and long-distance transmission.

MR. CAMPBELL SWINTON expressed surprise at the uniform results said to have been obtained with the crystal detector, which was usually very variable. No other method of measurement was so sensitive as the galvanometer method, and it would be a great benefit if a method could be devised which eliminated rectifying the current.

Dg. J. A. FLEMING, whose remarks were communicated, said that similar measurements had been carried out at University College on signals coming from the Eiffel Tower. The signals were received on an Einthoven galvanometer through the usual form of tuner. To calibrate the galvanometer they used the usual form of tuner. To calibrate the galvanometer they used two coils, the mutual inductance of which at various distances was known, so that by measuring the primary current by hot wire ammeter they could determine the value of the secondary current; the latter was made to take the place of the antenna current, and it was then possible to repeat the deflections of the Einthoven galvanom-ter produced by the Paris signals by a known current in an artificial autenna using the same frequency. The observations were made by Mr. Coursey; from the charts made it

appeared that the greatest-falling off in signal strength occurred when it was clouded both in Paris and London. But before any valid conclusions could be drawn it would be necessary to have an antenna set up near Paris and an automatic record kept of signal strength close to the rending station; such an antenna should be in duplicate—earthed and non-earthed. He could not believe that the large variations of strength in only 200 miles observed in London were entirely due to ionisation of the air; in short-distance transmission there was a considerable degree of propagation through and over the earth's crust, and recention was not entirely through and over the earth's crust, and reception was not entirely

due to a true space wave.

PROF. Howe said he also had been making measurements of PROF. HOWE said he also had been making measurements or signals, &., with a view to getting measurements of the actual field set up by the signals. He explained the difficulties of thermal galvanometer measurements, admitting the advantages of the Einthoven galvanometer method used by the author, which eliminated trouble due to other people sending signals. Basillie had showed that if the wave length was altered only a very little, great differences in results were obtained. He was very glad to hear a denunciation of the ionised atmosphere theory; it could be made to fit any desired condition at will.

denunciation of the ionised atmosphere theory; it could be made to fit any desired condition at will.

PROF. MARCHANT, in replying, said he wished to stimulate observation of signals, and had put up theories with a view to their being demolished if necessary. It was extremely difficult to calibrate an aerial, and they were driven to calibrating the secondary. The Einthoven galvanometer was one of the best available. He agreed that the Pacific was a wonderful place for transmission, and that this result was due to local conditions, as such results had never been obtained anywhere else. The energy record was quite different from the distance record. He found it quite hopeless to try to take direct measurements of signals. The ionised air theory was excessively convenient as a medium of explanation, but he was bound to say he thought ionised air was a factor. he was bound to say he thought ionised air was a factor.

NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

Electric Heating and Ventilation.

THE CBEDENDA CONDUITS Co., LTD., of Chester Street, Aston, Birmingham, after having spent a considerable time in experimenting and tests, have just placed on the market a system of heating and ventilating by electricity, and have now actually at work at the showrooms of their London agents (Messrs. Baxter and Caunter, Ltd., 219, Tottenham Court Road), an installation giving very satisfactory results in an exceedingly difficult situation, which they invite anyone interested to call and inspect.

Some of the advantages claimed for this system are set out below:—

It ensures proper circulation, distribution and equalisation of temperature, which is essential to a proper heating system.

Immediate results are obtained as soon as the electric current is switched on, in all parts of the building, and the heat is not localised as is the case when separate radiators or fires are used.

The system is entirely automatic in its action and requires no

attendant.

I: requires no coal or water, as in the case of steam heating plant, and does away with all boilers, radiators, steam pipes, valves,

trape and pumps.

It can be used for cooling the atmosphere in hot weather, and oan be fitted with air filters and ozonisers, which makes it an ideal system for hospitals.

The system is considerably less expensive both to install and

The system is considerably less expensive both to install and maintain than steam heating and other systems.

The system is so arranged that by switching on the full load the desired temperature of about 60° F. is obtained during the first hour, and the consumption of current can then be reduced to about

hour, and the consumption of current can then be reduced to about a third, which would maintain this temperature.

The company are prepared to undertake the installation of their system in any building, and to advise and quote for any work. They also make up these plants in a portable form, which can be easily carried from room to room. They will be pleased to give full particulars as to the capacity and output of their various plants, with the cost of running per hour, to those interested.

An Electric Kitchen in Derby.

The accompanying illustration shows the electric kitchen of the Whitehall Café, St. James's Street, Derby, which has recently been equipped under the direction of Mr. T. H. Thorpe, Darby, the architect for this imposing building and the Kinema Hall adjoining

The electrical equipment, which was all supplied by the BRITISH The electrical equipment, which was all supplied by the BRITISH ELECTRIC TRANSFORMER CO., LTD., London, at present comprises 31 standard "Tricity" hot-plates, all of which are operated from indicating control panels, with separate "on and off" switch and fuse, the hot-plates being interchangeable; 18 are for boiling purposes, and the remainder for operating two double ovens and four single ovens. There are, in addition, two 24 in. × 12 in. 6-KW. radiant grills, and a carving table 5 ft. × 2 ft. 3 in. × 2 ft. 10 in. high with hot cupboard, and two carving dishes with a maximum loading of 7 KW.

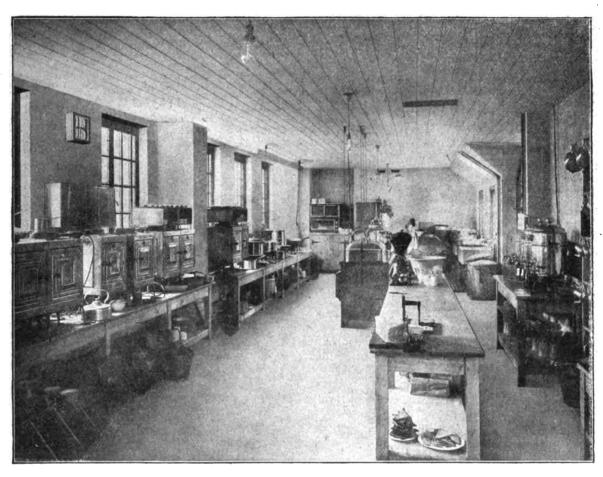

Tae general arrangement was set out by Mr. F. S. Grogan, of the British Electric Transformer Co., Ltd., in conjunction with the manageress of the Café, Mrs. A. Etheridge.

In the view at the far end will be noticed the meat grill, and on the table on the left are shown 12 boiling plates together with two single ovens opposite the chef's table. On the adjoining table two double ovens and two single ovens are grouped, for the use of the patissier who makes the whole of the cakes, rolls and pastries for the restaurant, and also for the shop attached to the Café. At the far end of the kitchen on the right are the washing-up sinks.

are the washing-up sinks.

The second grill, which adjoins the ovens, is retained for toasting work. On the opposite side of the kitchen are four hotplates, with water urns, and water-jacketed coffee and milk urns, these being immediately behind the tea dispatch counter. The carving table, which is in the centre of the kitchen, was installed here temporarily, but has since been removed to the restaurant.

"Khaki."—We have received a copy of the first number of a 6d. monthly magazine—Khaki.—which, trgether with a called news sheet, has been published for the purpose of keeping the over-sea soldier posted with news from the Colonial home that he has left behind him the while he lends his aid to the Mother Country. The magazine is a very creditable production, containing a number of attractive features; the illustrations, some of which are executed in colour, are a strong point. Among the contributors to this number are Marie Corelli, the Earl of Ronaldshay, Lord Willoughby de Broke, Israel Zangwill, Rudyard Kipling, Jerome K. Jerome, Norman Bentley, W. T. A. Beare and Victor Grayson. The magazine Khaki is published at Imperial House, Kingsway, W.C., and is stated to be a patriotic—not a commercial—enterprise.

THE ELECTRIC KITCHEN OF THE WHITEHALL CAFE, DERBY, EQUIPPED WITH "TRICITY" APPARATUS.

The electrical arrangements have worked so satisfactorily that extensions are at the moment in hand for the equipment of the basement floor with four additional ovens and two more grills. It is hoped that this will be opened during the next week or two.

tis hoped that this will be opened during the next week or two.

The business of the Café has during its first two months' working far exceeded expectations, and this result is undoubtedly due in a large degree to the appointment of Mrs. Etheridge, who has not only had West End experience, but was for a time associated with the "Tricity" House, London.

The Café is illuminated by indirect lighting, and its cosiness makes it an attraction remoderation. The supply presents is 230 voltage.

The Café is illuminated by indirect lighting, and its cosiness makes it an attractive rendezvous. The supply pressure is 230 volts, and the installation is balanced on the two sides of the three-wire system. There is also a duplicate service carried into the meter room, with a three-pole throw-over switch.

WAR ITEMS.

Board of Trade Reports.—The Board of Trade Commercial Intelligence Department has now issued list (8B), which is the weekly list dated February 13th, of inquiries for sources of supply of goods. Copies may be obtained by British manufacturers on application.

Metal Prices in Germany.—According to La Lumière Electrique, the price of copper in Germany is about £110 per ton; of aluminium, £225 to £250 per ton, compared with £80 before the war; and of antimony £100 to £105, compared with £22 10s.

York Electricity Employés.—A return made by Mr. J. W. Hame, electrical engineer and tramway manager at York, shows that 55 of the staff are serving with the Colours—22 from the electricity department and 33 from the tramways department. Two men formerly in the latter have lost their lives—H. Rawson, of the King's Own Scottish Borderers, and G. Britton, of the Lance. Fasiliers.

Notes from France.—M. H. Parodi, who bore a prominent part in the proceedings of the joint meeting of the Société Internationale des Electriciens and the Institution of Electrical Engineers at Paris in 1913, as chief engineer of the electric service of the Cie. de Chemins de fex d'Orléans, went to the front as lieutenant of artillery. La Lumière Electrique announces that in consequence of his eagerness to undertake any dangerous task that offers itself, and his excellent work in the trenches, he has been named Chevalier of the Legion of Honour and promoted to captain. His high position on the railways would have entitled him to higher rank than that of lieutenant had he chosen to accept it.

M. J. L. Routin has also received the Order.

M. J. L. Routin has also received the Order.

Amongst those who have fallen are P. Le Bœuf, a valued contributor to La Lumière Electrique; Henri Bureau, of the Laboratoire Central d'Electricité; and Paul Reuss, chief engineer to the Compagnie Tnomson Houston.

The same journal gives a complete and detailed list of the enemy firms of an electrical character that have been sequestrated by the French Government.

Russian and British Relations.—A Reuter dispatch from Petrograd states that at a distinguished gathering of professors held there, which was attended by Councillors of the Empire and members of the Duma, M. Bieloff, librarian to the Duma, delivered a lecture in which he urged that a society should be founded for establishing closer relations between Russian and British professors and students. An influential Committee was appointed, and the desire was generally expressed for the eradication of German influence from Russian education.

German Electric Concern Sequestrated in Kieff.—The Kieff Myssl says that by decree of the War Department the Kieff branch of the German concern called the Siemens & Haleke Russian Electro-Technical Factories Co. has been sequestrated. The property of the branch referred to is valued at several hundred thousand roubles.

thousand roubles.

Relief Fund.—Messre. Raphael Tuck & Sons, Ltd., have issued their patriotic subject "Defenders of the Empire," in popular postcard form, in the form of an "Oilette" picture for framing, and as a zag-zaw puzzle. The entire proceeds are to go to the Prince of Wales's National Relief Fund

The Government and Engineering Labour. — As a result of the recent conference between the Engineering Employers' Federation and the Engineering Trade Unions to secure greater output required by the Admiralty and War Office, the Executive Council of the Amalgamated Society of Engineers has issued a statement to its members setting forth the proposals and suggestions of the Unions to express the theoretic in various classes of tions of the Unions to overcome the shortage in various classes of workpeople. They are as follow:—

(a) Firms not engaged in manufacture of war goods to be given

such work.

(b) Firms at present working short time to transfer their work-

men to firms engaged on Government work.

(c) Joint representations to be made to the Government to pay subsistence allowance to men working in places a distance from

(d) That the Government draft skilled engineers from Australasia, Canada, and South Africa.

(e) In view of the fact that 10000 skilled engineers have recently enlisted, thus reducing the supply of skilled labour, the Government should withdraw from military duties all those avail-

able for industrial purposes.

The men's representatives consider that if the foregoing sugges tions were adopted, a sufficient supply of skilled labour would be at the service of the nation to cope with the national situation without encroaching upon the trade rights of operative engineers. We should have thought, however, that the present is not the time to insist upon "trade rights." There has never been a time in the history of Trade Unionism when there was more need for the co-operation of employer and employé. Apparently patriotism and Trade Unionism are not convertible terms.—Machinery Market.

A War Trade Department.—According to a statement published in several newspapers, in view of the complexity and volume of work involved in dealing with applications for export and import licences during the war, a Department under the Treasury (to be called the War Trade Department) has been formed to replace (to be called the War Trade Department) has been formed to replace the Committee on Trade with the Enemy, so far as this work is concerned. At the request of the Prime Minister, Lord Emmott has consented to act as Director of this Department, and Sir Nathaniel H ghmore will be the secretary. The War Trade Department will deal with all applications for the grant of export and import licences, and will embrace an intelligence division, which will serve as a clearing house for all war commercial information. The remainder of the work of the Trading with the Ecomy Committee (relating to the movements of funds and other Enemy Committee (relating to the movements of funds and other questions in which the Treasury is mainly concerned) will be transferred to the Treasury, and will be performed by Sir Arthur Thring, the Parliamentary Counsel, and his staff. Exporters and others concerned are informed that all applications for licences to export prohibited and restricted goods, and all communications in respect thereof, which have hitherto been sent to the Commissions. sioners of Customs and Excise, should be sent to the offices of the new Department, addressed to the Secretary. War Trade Depart-ment, 4, Central Buildings, Westminster. S.W.

Incandescent Electric Lamps in Russia. At a recent meeting of the electrical section of the Russian Technical Society, it was shown that the number of electric incandescent lamps in use in Russia is about 15,000,000, and that the increase in the use of In Russia is about 15,000,000, and that the increase in the use of electric light is about 15 per cent. per annum. It was calculated that the annual demand for lamps would be, 10,000,000—7,500,000 renewals, and 2500 000 to supply increased demand; lamp sockets. 3.500,000; switches, 2000 000: plugs, about 1,000,000; and knife switches, about 10,000,000. On the question of the possibility of producing these goods in Russia no clear views were expressed. The meeting thought the estimated quantities were very moderate, and that the number of 10,000,000 as the annual consumption of lamps might be accepted in all as the annual consumption of lamps might be accepted in all safety.

Dublin Electricity Staff -In a report issued by the Dublin Electricity Committee, authority is a ked for to pay extra remuneration on a re-arrangement of the engineering staff owing to four of its members—Meesrs. Donney, Carrigg, Clancy and Cox—volunteering for Army Service. It having been decided to push forward the conversion of the gas lamps to electric, Mr. E. J. Davidson has been put in charge of the construction work. The total salaries of the four engineers referred to amount to £543; the allowance of half-pay to relatives is stated at £281, and the special allowance required for the war period is £191.

War Bonus.—The directors of the British Insulated and Helsby Cables, Ltd., Helsby, have decided, owing to the increased cost of living, to grant war bonuses as follows:—To workers receiving 30s. per week or over, a bonus of 3s. per week; over 20s. and less than 30s., 2s. per week; under 20s., 1s. per week. The bonuses, which started as from Thursday last week, and apply to male and female workers, will run for three months, and it will then be considered whether they shall be continued or modified or withdrawn.

Anglo-Belgian Co.-We observe that a new company known as the Socié é Anglo-B-lge D'Exportation, Ltd., has been registered with a capital of £5,000 in £1 shares, to carry on the business of merchants, electrical, mechanical and building contractors. &c. Among the first directors are Mr. R. W. B ackwell and Mr. Philip Dawson. The offices are at 14, Great Smith Street, West-Dawson. The minster, S.W.

Learning Russian.—In reply to a question in Parliament the other day it was stated that the Board of Education were considering with the Board of Trade, possible extension of the teaching of Russian in commercial schools and classes and other educational institutions. It is stated that the City of London College, Moorfields, has some 60 students learning the language.

Blackpool Employés.—There are now some 64 members of the Blackpool Corporation electricity and tramways department serving H.M. Forces in different unite.

CARLES NO.

"To What Base Uses,"—Eastern Engineering says that the Allgemeine Elektricitäts Gesellschaft "no longer manufacture 10,000 kw. turbo-generators. They are making brass buttons instead."

Personal.—Sergt. J. Stephenson, of the 2nd South Lancashire Regiment, who had been mentioned in Sir John French's dispatches, was formerly employed in the Nelson tramways department.

London Gazette notice: Territorial Force.—Cornwall (Fortress)
Engineers, Electric Lights Company, Sergt. Bernard Harvey Peter
to be Second Lieutenant, February 24th, 1915.
The Times states that King Albert of Belgium and Admiral of
the Fleet Lord Fisher were elected honorary members of the
Institution of Civil Engineers on Tuesday last.

Roll of Honour.—Lance-corpl. J. Alfred Donald, of Blackpool, formerly an employé of the Blackpool Corporation electricity department, died suddenly last week while on leave, the cause being cardiac trouble. He was 24 years of age, and had recently joined the Royal Naval Division Engineers stationed at Deal.

We have received from the British Aluminium Co., Ltd., a copy of the "Roll of Honour" prepared by the company, giving the names of the very large number of representatives from the different offices and factories who have joined the Army and Navy. It takes the form of a large wall sheet.

LEGAL.

SWANSEA GAS LIGHT CO. v. SWANSEA RUBAL DISTRICT COUNCIL.

THE hearing of this case was concluded in the Court of Appeal, composed of the Master of the Rolls, Lord Justice Phillimore, and Mr. Justice Joyce, on Tuesday last week, upon the plaintiffs' appeal from a judgment of Mr. Justice Warrington.

Plaintiffs brought the action for a declaration that an agreement Plaintiffs brought the action for a declaration that an agreement made between the parties dated November 5th, 1909, was still in force and valid. Plaintiffs were supplying gas in Swansea and district under statutory authority, and by the agreement the company agreed to extend gas mains to certain roads in Llansamlet and Clase Rural, and to supply gas to public lamps of the defendants upon certain terms, and during the continuance of the agreement defendants covenanted not to put in force the powers conferred upon them by the Llansamlet Electric Lighting. powers conferred upon them by the Llansamlet Electric Lighting Order (1908) for the supply of electrical energy for street or private lighting within that portion of their district agreed to be lighted with gas under the agreement, and that they would not during the period substitute any other method of lighting for gas supplied by the company is but nothing in the garden. ing for gas supplied by the company; but nothing in the agreement should prevent the defendants at any time putting in force the order for the supply of power. The agreement was to run for 25 years. Some of the roads referred to in the agreement were outside the area within which the plaintiffs had power to supply, and by the Swansea Gas Order (1910) the limits were extended; the price of gas within one mile of Swansea was the same as that charged within the borough, and the gas mains were to be extended, &c. Relying upon that agreement the plaintiffs had incurred considerable expense in laying mains and running service pipes from the mains to the lamps for public lighting. Defendants contended that the effect of the order of 1910 was to supersede the agreement and to release them from liability thereunder, and the agreement and to release them from mainty thereunder, and they claimed that they were now at liberty to put in force their power of supplying electrical energy for lighting within any portion of the district agreed to be lighted with gas by the plaintiffs, and they had begun to lay cables for the supply of electricity in districts served with gas by the plaintiffs. Defendants also pleaded that the agreement was ultra vires and denied committing any breach of it, and they also relied on the provisions of the Public Authorities Protection Act, 1893. Mr. Justice Warrington held from what took place in the House of Lords' Committee Room in 1910 it was agreed that the agreement should be superseded, and he, therefore, gave judgment for the defendants with costs, and from this decision the plaintiff company now

mr. George Cave, K.C., M.P., and Mr. Percy Wheeler appeared in support of the appeal; and Mr. Clauson, K.C., and Mr. Tomlin, K.C.

the respondents.

MR. CAVE contended that when the agreement was come to in 1909 it was contemplated by everybody that the plaintiffs should apply for a provisional order to extend their area of supply. At the trial the Council's witnesses said it was expressly agreed in the Committee corridors that the agreement should be rescinded, but Committee corridors that the agreement should be rescinded, but that the Gas Co.'s witnesses denied, and the learned Judge had held that the question of rescission was not raised. Unfortunately, when the Committee was finally informed of the settlement, the company's agent, Mr. Cooper, used the following words:—"Would your Lordship allow me to mention in connection with the new clauses 6 and 6a, that they are the result of an agreement come to in reference to the terms of the order, which agreement is a compromise, and superseds the agreement made between the promoters and the opponents in November last?" On that sentence the learned Judge had decided that the whole agreement had gone. He (Conneel) contended that the only point discussed between the parties was price.

MR. JUSTICE JOYCE: Of what use is the rest of the agreement to

MR. CAVE: It gives us the public lighting of those parishes for 25 years on terms which have been very carefully laid down, and without which it would be impossible for any company to undertake public lighting in any district. He submitted that the appeal ought to be allowed.

ME CLAUSON and ME Tomlin having supported the judgment of Mr. Justice Warrington on behalf of the respondents, and ME. CAVE having replied at the conclusion of the arguments, the MASTER OF THE ROLLS, in delivering judgment, said that for the defendants to succeed they had to establish that the agreement in question had been superseded by an agreement made in the House of Lords when the company were obtaining their provisional order. To succeed the defendants had to establish that there was a contract to that effect. Mr. Justice Warrington had come to the conclusion that there was no such bargain, and it was impossible for the Court to take a different view. But the Judge had held that although there was no binding agreement made in 1910 for the supersession of the document of November, 1909, yet the parties had proceeded on the footing that there was some such agreement. That was a proposition on which there had been no real argument, and it was not necessary to decide it. But Mr. Justice Warrington had held that the application for a provisional order extending the Gas Co.'s limits of supply was in the minds of both parties in November, 1909, and under these circumstances it was not open to the defendants to say that the contract could not be enforced.

The other Judges concurred, and the appeal was accordingly allowed, and a declaration made that the agreement of 1909 had not been cancelled by any such agreement as was suggested, nor was it varied save (if at all) so far as it was varied by the provisional order.

The appellants were awarded the costs of the appeal, there being so order as to the costs in the Court below.

L.C.C. v. Assessment Committee of the Borough of ISLINGTON.

In the House of Lords on Monday the hearing was concluded of an appeal by the L.C.C. against a decision of the Appeal Court, which est aside an order of Mr. Justice Bray and Mr Justice Lush for the appointment of a person to make a previsional valuation list containing the gross and rateable value of the tram ways as reduced. The Council made its application for a valuer on the ground that competition by motor-buses had affected the tramways and entitled them to a provisional assessment. Their Lordships now allowed the appeal, and stated that they would give the reasons for their decision at a later date.

FOSBERY v. DUBLIN UNITED TRAMWAY Co., LTD.

On February 19th, a Dublin jury awarded £1,100 to Mrs. Fosbery, wife of Mr. George Fosbery, an official of the National Bank, Dublin, who sued the Dublin United Tramway Co. for damages for injuries caused to the plaintiff by defendants not having properly lighted a lorry in Dublin one night last December, whereby the plaintiff fell over the shafts of the vehicle. Defendants accepted the verdict, but contended that the damages were excessive. A stay of the plaintiff that the damages were excessive. of execution was granted to enable them to move further in the matter, and they agreed in the meantime to pay £200 to the plaintiff.

DISTRIBUTION AND RISE OF TEMPERATURE IN FIELD COILS.

By Prof. M. MACLEAN, D.Sc., M.I.E.E., D. J. MACKELLAR B.Sc., A.M.I.E.E., and R. S. BEGG, Grad.I.E E.

(Abstract of paper read before the Institution of Electrical Engineers at Glasgow, February 9th, 1915.)

THE paper deals with the temperature rise at various points in a field coil of a 120 kw. variable-speed D.C. motor, under various conditions; the motor is installed in the Royal Technical College, Clasgow, driving an alternator, and is a six-pole 500 volt machine with commutating poles and a compensating winding. Thermocouples of copper-constantan were provided by the makers in one of the coils, as shown in fig. 1; the rise of temperature of E was practically equal to that of A, and D to B, so D and E were omitted from the curves. The distribution of temperature is shown in fig. 2, for an armature current of 8 amperes, and fig. 3 shows the rise of temperature at the hottest point C for the same armature current, while fig. 4 shows the rise for an armature current of 150 amperes.

The field coil is cylindrical, with a superficial area of 1,746 cm². excluding the area of the pile shoe, which is 1,450 cm².

The ratio of the flual rise of temperature to the number of watts is greater for the higher speeds as shown in Table I. A speed of 750 R.P.M. corresponds to a peripheral speed of the armature of 23'56 metres per second. On the other hand, the ratio for generators is less for increasing speeds.

TABLE I.

Pield			Final rise of	Rise in tempera-				
ourrent, amperes.	ourcent, amperes.	speed, m. per sec.	temperature at C in degrees C.		ture + watte after 6 hours.

the armature are 512, 414 and 325 respectively, the mean values of a and b being 232's and -0.023 respectively.

Electric-Light Switching Examinations.—We have on previous occasions alluded to the examinations instituted by Messrs. A. P. Lundberg & Sons, and the subject is brought to the front once more by the lists of successful competitors in the most recent of these examinations, which are published in this issue. Considering that the subject dealt with mainly concerns those of fighting age, the results given are eminently satisfactory so far as numbers go, and it is to be presumed that they are also satisfactory from the examiners point of view. It seems that the factory from the examiners' point of view. It seems that the subject of electric-light switching (otherwise, the control of glow-lamp circuits by means of more or less special tumbler switches), which has been brought into prominence by this means, has come

REVIEW.

Brown's Marine Electrician for Sea-Going Engineers. By A. E. and A. H. LARKMAN. Glasgow: J. Brown & Sons. Price 5/- net.

Since we last reviewed this book, in our issue of December 1st, 1905, it has been very considerably revised, and many of the criticisms we then made have apparently borne fruit. There is, however, still a need for the elimination of those parts which appertain only to land installations, whilst more space might be suitably devoted to "wiring," which is somewhat inadequately treated in the present edition as regards its special bearing on ship work.

It is news to us to learn that commutators are now made of phosphor-bronze instead of copper. We think the authors must be generalising from some

particular instance they have in mind.

In discussing alternating current, the authors appear to be under the impression that high pressures are essential. On page 23, in discussing alternating currents generally, the reader is given the impression that the usual method of dealing with alternating current is to generate at 5,000 volts and transform in the station down to 2,000, and then transmit the current at this pressure to the point of consumption, where it is again transformed to about 50 volts. We learn also that "alternating currents have been used and discarded intermittently by engineers, but since the introduction of transformers their use aboard large vessels is probable," notwithstanding that, according to the authors, "the distribution of current to several points of consumption introduces difficulties where A.C. is used." All this is quite irrelevant to marine practice, as the question of high pressures does not arise.

There is a little inconsistency here and there, as, for example, in connection with single wiring. On page 3 the authors state "c.c. (continuous current) is very suited to the single wire system of distribution so much used in ship lighting," whereas on page 144 we learn that "single wiring is abolished in the Royal Navy, and is also disappearing in the newer types of mercantile marine." As a matter of

fact, we believe that the single wiring system has been practically obsolete for many years.

Dealing with the methods of driving in vogue, the authors are behind the times in referring to belt driving of dynamos on board ship, as the almost invariable practice now is the direct coupled system. Seeing that one of the authors is a marine engineer, we are surprised at the suggestion to place a dynamo two decks vertically above its driving engine, and also that special multiple-cylinder engines such as "Brotherheads," (sic) "Williams," (sic) "Central Valve," "Tower" and "Globe" are now used for electric lighting on board ship.

The section on wires and cables is fairly well done, and the illustrations of joints are very clear, but we think the Britannia joint is hardly applicable to ship lighting work, as the only use to which it is put is in connection with overhead bare solid conductors. In this section there are one or two misprints in connection with the diagrams. The jointing system shown in fig. 102 is referred to as fig. 103, and the three-contact rose system is referred to as 104 instead of 103. This diagram, and also fig. 104 of the three-contact rose, refer really to land installations where flexible pendants are used from ceiling roses.

The chapter on accumulators contains some useful information, but the authors are weak on the theory of the accumulator, as, according to them, the action of charging coats one plate with a layer of hydrogen bubbles, and the other with a thin layer of lead sulphate, the lead having united with the SO+ of the acid. On discharging, a current flows in the opposite direction and the plates return once more to their normal condition—" that is the whole

theory of accumulators." The illustration, as in the previous edition, shows a group of accumulators in glass boxes, although the authors now rightly add that cells for ships' use are more usually made of lead or teak. The fact is they are almost invariably of lead-lined teak, and we would suggest that if any future edition is called for the illustration should be amended accordingly.

Generally speaking, there is much useful information in the book for marine electricians, but its value is impaired by the insertion of matter which has very little bearing on marine work and by inaccuracies here and there, some of which we have pointed out

above.—F.B.

ELECTRIC HEATING AND COOKING.

A PAPER was read on this subject at a recent meeting of the BIRMIN HAM AND DISTRICT ELECTRIC CLUB by Mr. R. WEAVING (Manchester). The author said that for the past four years electrical heating and cooking had been serious competitors for older methods to meet, and there was no doubt that the invention of the nickel-chrome resistance alloy had been of the utmost importance in aiding the development of the apparatus. Previous to this discovery there was no common metal which could be safely run at a bright red temperature for any length of time when exposed to the air; consequently the most popular electric heater, the electric fire, could not have existed without nickel-chrome wire. He regarded the electric fire as the best heater, as it had the following advantages: (1) It warmed immediately by means of radiant heat, any solid body placed before it; (2) it warmed the air gradually, but much more quickly and directly than a lamp radiator; (3) it had the appearance of a fire. To be a commercial success the electric heater must be reliable, inexpensive to maintain and low in first cost; the terminals should be heavy and placed in a convenient position; the amount of wire used in the element should be provided. As on most electric heaters the switches were near the ground, a tumbler switch was more convenient than the rotary type, and although the tumbler was more often operated by the foot than the hand, a good switch would stand this treatment quite well. The electric heater to compete commercially must be roughly 19 times as efficient as the coal fire and 3-1/3 times as efficient as the gas fire. These were very great disadvantages, but still they found that electricity could hold its own. With an electric heater no combustion took place and if proper precautions were taken the whole of the heat generated was useful. With a gas or coal fire the products of combustion had to be taken away, and with them went the greater part of the heat. This was fatal to high efficiency. Electricity had many advantages the valu

degrees in one hour, and half this consumption would maintain the temperature.

The chief points to be considered in electric cooking were reliability, low first cost, and low running costs. Reliability was largely a matter of design. All efforts of design from the engineer's point of view were directed to securing the proper conditions for long life in the heating element. For good and economical cooking the heat should be evenly distributed in the oven, yet the elements should be arranged so that the cook could make any portion of the oven hotter than the rest. The size of terminals was even more important than on electric heaters. They should be heavy enough to remove the slightest doubts of their electrical carrying capacity or mechanical strength. The elements should be easily replaced and cheap to renew. The position of the heating elements was important; bottom heating only did not give good browning on the top of pastry; top and bottom heat was better, and when used in an oven which was broad in proportion to its height, was quite good, but when the oven was of ordinary shape, that is in a ratio of height to width of 3/2 the best results were undoubtedly obtained by the use of side elements. The whole of the interior of the oven should be vitreous enamelled including shelf and shelf racks. The loading of the elements should be enough to raise the oven to a cooking temperature in 25 to 30 minutes, and a temperature of 350 degrees should be maintained by 1/3 heat. It was necessary to get direct radiation on to pastry and meat to insure a good colour, and this could only be obtained by running the elements at a temperature giving the correct proportion of radiant and convected heat to suit the oven. Too much radiant heat would brown the outside without cooking the inside, while too low a temperature on the elements would tend to give tough pastry of poor colour. At present the rotary switch was most favoured

by designers, but the author had used tumbler switches with first-class results, and had had a switch of this type rated at ten amps. breaking 25 amps. at 230 volts 20 to 30 times daily for three months. If the best and most economical results were to be obtained a thermometer must be used. results were to be obtained a thermometer must be used. After dealing with the various apparatus, he said there was no doubt that electricity at a penny or even 1½d. per unit compared favourably with gas for all oven work, and when energy could be purchased at a penny per unit or under a complete cooking outfit would not cost more to run than the corresponding gas cooker. In addition there was the unchallenged superiority of the results obtained in an electric oven.

TRADE STATISTICS OF THE STRAITS SETTLEMENTS.

THE following statements, showing the imports of electrical and other materials into the various Straits Settlement ports in 1913, is taken from the recently-issued official trade statistics. The values for 1912 are added for purposes of comparison, with notes of any increases or decreases.

BUSINESS NOTES.

Consular Notes.—SPAIN.—An interesting description of the operations of the Barcelona Traction, Light and Power Co., and of its offshoot the Ebro Irrigation and Power Co., is contained in the report by the British Consul-General at Barcelona, which has just been issued.

The effect of all this hydro-electric development on the machinery trade of Barcelona has naturally been to discourage the importa

trade of Barcelona has naturally been to discourage the importation of steam engines and boilers, and correspondingly to stimulate that of electrical plant. Oil engines are not imported nor are they likely to be as long as the duty levied on oils is so high. Gas engines are not asked for at present.

As regards Valencia, the British Consul says that every year there is an increased demand in his district for small motor engines, chiefly petrol, for use in working small pumps for irrigating, and although a certain percentage of British makes are seen, the majority of such motors appear to be of Continental manufacture.

Our Vice-Consul at Palma de Mallorca reports that in view of the successful installation of electric light and power plants in Palma, several companies have been formed for this purpose in the most important towns in the interior, viz., Soller, Alaro, Binisalem,

most important towns in the interior, viz., Soller, Alaro, Binisalem, Manacor, Santa Margarita, Inca, &c. It is also hoped to establish

a tramway system. CHINA.—A ren a tranway system.

OHINA.—A report has just been issued by H.M. Commercial Attaché at Peking dealing with the foreign trade of China for the year 1913. There is much in this report, despite its lateness, which is still of interest. The vast potentiality of the market is shown by the figures giving the gross value of the foreign trade coming under the cognisance of the Chinese Maritime Customs, viz. £152,000,000 in 1913 (as compared with £132,500,000 in 1912), and by those giving the net value of foreign imports, viz., £86,000,000, being nearly £14,000,000 more than in 1912. The increase in imports is due to a growth of trade all round, and cannot be entirely accounted for by any fortuitous or impermanent circumstances, such as the piling up of import stocks, or a boom in any

particular product. Metals and minerals account for an increase of £1,500,000, and machinery for an increase of £300,000. In connection with these imports there is no indication of the increases being due to over-trading, and from the point of view of those interested in the general trade of China, the figures may be regarded with satisfaction, as compensating to some extent the

regarded with satisfaction, as compensating to some extent the depression in other branches.

The total entries under the two heads, "Machine Tools and Machinery" (including cotton gins, which appear separately in the Customs returns) amounted in 1913 to a value of £1,087,862, being an increase of £382,863 over the corresponding figures for 1912. The increase is distributed under every item, and especially under the head of "Machinery, Unclassified," which forms nearly three-fourths of the whole; but the increase in textile machinery may be specially noted in connection with the growth of the cotton spinning industry of Shanghai. Hand tools, which are not included in the above figures, rose in value from £30,696 to £41,337. A good deal has been written about the rising demand for hand tools in the China market, and it may be worth while to point out tools in the China market, and it may be worth while to point out that, great as the demand for such articles may be in the future; that, great as the demand for such articles may be in the ruture; the trade in them is at present confined, as these figures show, to very small dimensions. Electrical materials and fittings rose in value from £256,419 to £350,770. The steady increase shown by the figures for this item during several years past is to be attributed to the growing use of electric lighting, which continues to spread in Chinese cities, in spite of financial difficulties. Two or three particles in minor towns were carried out during 1913.

in Chinese cities, in spite of financial difficulties. Two or three new installations in minor towns were carried out during 1913, mostly with plant of British manufacture.

The continued rise in the volume of the principal articles of export, and the continually extending variety of articles of native produce, are the most promising features of the foreign trade of China during the last decade, inasmuch as hopes of future development rest primarily on the increase of exports. The percentage of exports to imports went down to 70.7 per cent in 1913 after an average of 80.3 per cent, in the four preceding years. The expert trade had to suffer from high exchange, low prices in the European markets, and especially from the want of silver to finance it. With all these adverse circumstances the Commercial Attaché considers it wonderful that the disproportion between exports and imports

all these adverse circumstances the Commercial Attaché considers it wonderful that the disproportion between exports and imports in a year characterised by so enormous an increase in the latter, was not much greater than it turned out to be. The situation was, in fact, saved by the fortunate circumstance that the country on the whole enjoyed good harvests in 1913 as it did in 1912.

The following table shows the shares taken by the United Kingdom, Hong-Kong, Japan, and Germany in the import and export trade of China in 1912 and 1913. Two-thirds of the imports are included because the growth of its trade is enormously greater than that of any other country, and Germany, for the reason that German competition has followed perhaps more closely than that of other European countries the lines of British trade. The heading "other countries" includes the trade of India and of the other British Dominione. The figures are approximately in 1,000,000 Haikuan taels (reckoned at 3s. 0§ i. in 1912 and 3s. 0 dd. in 1913):—

Imports.

		Imp	orts.	Exp	orts.
		1912.	1918.	1912.	1918.
United Kingdom	•••	75	97	16	16
Hong-Kong	•••	148	172	103	117
Japan	•••	88	119	55	66
Germany	•••	21	28	14	17
Other countries	•••	151	170	182	188

The percentage of the trade of the United Kingdom and Hong The percentage of the trade of the United Kingdom and Hong Kong together to the total foreign trade, has fallen from 48 per cent. in 1905 to nearly 41 per cent. in 1913, that of Japan has risen from 14 per cent. to nearly 19 per cent., that of Germany has risen from 3 per cent. to over 4 per cent., and that of other countries has risen from 35 to 36 per cent.; 40 years ago the United Kingdom and Hong-Kong together accounted for 67 per cent. of the trade, and as trade expands this proportion tends to diminish still further. So long as the trade between the United Kingdom (and Hong-Kong) and China continues to increase in itself, it cannot be said to be in an unhealthy condition. A consideration (and Hong-Kong) and China continues to increase in itself, it cannot be said to be in an unhealthy condition. A consideration of the relative growth of the trade of other nations is, however, a useful reminder that the days of unchallenged supremacy are over, and that in order to retain that supremacy a much closer attention to the requirements of the China trade and to the means of supplying these requirements than has been considered necessary in the past is increasingly called for.

Liquidations.—The Lighthouse Radiator Co., Ltd. Particulars of claims must be sent by Mar:h 6:h to the liquidator, Mr. J. B. Rapkins, 10 Wellington Place, Guildford. A meeting will be held on March 23rd to hear an account of the winding up.

ERRO LIGHT AND POWER CONSTRUCTION CO., LTD.—A meeting will be held on March 22nd, at 232, Strand, W.C. to hear an account of the winding up from the liquidator, Mr. R. H. Bentley.

STOLZ ELECTROPHONE CO. (LONDON), LTD.—A meeting will be held at 4B, Frederick's Place, Old Jewry, E.C., on March 24th, to hear an account of the winding up from the liquidator, Mr. A. F. Whinney.

Anchor Hospital and Distress Fund.—The fourth annual general meeting of members of this fund, which is in operation at the Anchor Cable Works, Leigh, was held on repetation at the Anchor Carle works, Leigh, was held on February 16th, Mr. J. Bowyer (the works manager) presiding. The fund exists for the purpose of making annual grants to hospitals, convalescent homes, &c., thereby ensuring to members hospital treatment in case of accident or other sickness, and for granting temporary relief to members in exceptionally distressed circumstances, so that shop collections may be discontinued. The

Hon. Secretary (Mr. A. Crooke) reported that all the employée Hon. Secretary (Mr. A. Crooke) reported that all the employés in the works and offices at Leigh, aged 17 or over, were members, each member paying 1d. per week. He pointed out the useful work which had been done by the fund. Members have been sent to convalescent homes, and recommendations issued to those requiring attention at the various medical, surgical, and other institutions to which the Fund contributes. Particular attention has been given to eye trouble amongst the employés. Proper examination and treatment have been afforded, and where necessary spectacles have been provided. Grants have also been made to members during sickness, and young employés from poor families have been clothed and fed, as found necessary. The Committee of the Fund are responsible for the administration and distribution of the allowances made by the firm to dependents of members who the Fund are responsible for the administration and distribution of the allowances made by the firm to dependents of members who have joined H.M. Forces, and are also responsible for the maintenance of a Belgian refugee family at Bedford, to whose support all the members of the Fund contribute. Under the auspices of this Fund fortnightly grants are made to the Mayor of Leigh's branch of the Prince of Wales's National Relief Fund, and to date a total amount of £37 11s. 7d. has been handed over. Out of the balance in hand of £74, grants, to the value of £48, to infirmaries, hospitals, £0,, have been made. The officers were unanimously re-elected for the ensuing year. The Fund is generously and sympathetically assisted by the Anchor Co., its directors and management.

Catalogues and Lists.—Messrs. J. H. Holmes and Co., Newcastle-on-Tyne.—Pamphlet No. 72 (four pages), gives half-tone views of various types of switchboards for lighting and power service, and for mining, mill and marine installations.

MB. H. C. SLINGSBY, 142, Old Street. London, E.C.—Sheet of designs of trucks, ladders and barrows.

designs of trucks, ladders and barrows.

MESSES. MARSHALL, SONS & Co, LTD, Britannia Ironworks, Gainsborough.—Catalogue No. 891 (16 pages), containing full descriptive particulars, with illustrations, and tabulated size, dimensions, &c., of fixed and portable types of oil engines.

MESSES. SIMPLEX CONDUITS, LTD, 116, Charing Cross Road, W.C.—New electric light fittings catalogue of 276 pages. It begins with information relating to the Simplex "Unit" system of electric light fittings and notes on fittings design, and closes with a numerical reference number index, and between these two extremes there lie hundreds of illustrations and prices of a wide and varied selection of electric light brackets, pendants, elecextremes there lie hundreds of illustrations and prices of a wide and varied selection of electric light brackets, pendants, electroliers, ceiling fittings, table standards, shop window and outdoor signs, glassware and silk shades, and some 50 pages displaying many designs of electric heating and cooking appliances.

PREMIEE COOLER AND ENGINEERING Co., LTD., Broadway Court, Westminster, London, S.W.—Pamphlet No. 700 describes the Premier wet-air fifters, and No. 701 is a 16-page catalogue fully described with the standard and held tone illustrations with discrement and held tone illustrations and prices.

describing, with diagrams and half-tone illustrations, the Premier dry-air filter plants. Both types of filters are stated to be largely used in electric power stations.

Book Notices. - "Sell's Directory of Registered Tele-Rook Notices.—"Sell's Directory of Registered Telegraphic Addresses," which has just been issued for the year 1915 (166, Fleet Street, E.C., 25a.), is, as usual, a very imposing volume. In the sections relating to (a) British Empire Overseas and (b) Fireign Countries, names and cable addresses of no fewer than 30,000 firms appear. The usefulness of such a publication needs no emphasis when communication by cable between this country and Overseas markets is so important a matter to all manufacturers and traders. The volume (2,600 pages) also contains an index to 80,000 telegraphic addresses registered in the United Kingdom, the information as usual being compiled from official lists. A classified list of trades is entitled "The National Directory of Commercial Houses." and it contains about 100,000 names.

fied list of trades is entitled "The National Directory of Commercial Houses," and it contains about 100,000 names.

"The Engineer's Year-Book of Formula, Rules, Tables, Data, &c., for 1915." Edited by H. R. Kempe, M Inst.C.E. London: Crosby Lockwood & Son. Price 15s.

A Meldrum Destructor in Australia. — A refuse destructor has been erected for the North Sydney Council by MESSRS. SWARBRICK & Co., representing Messrs. Meldrums, Ltd. It is of the Meldrum Simplex, breast-feed type with four grates, each grate being capable of treating 12 to 15 tons of garbage, or a total of 50 to 60 tons in 24 hours. The actual cost of burning has been of 50 to 60 tons in 24 hours. The actual cost of burning has been 1s. 7d. per ton. Provision has been made for dealing with noxious gases and smoke, which are consumed and rendered harmless and inoffensive. It is proposed to utilise the steam generated in conmection with tar plant adjoining the destructor, and for other municipal purposes. The cost was about £7,000.

New Zealand.- A Christchurch firm which formerly acted as agent for German firms wants to get into touch with British makers of pocket lamps and batteries, small motors (1½ to 6 volts) and dynamos, metal-filament lamps, and electrical novelties. Communications to HM. Trade Commissioner for New Zealand, P.O. Box 369, Wellington.

Bankruptcy Proceeding. - G. J. T. Parfitt, consulting electrical engineer, Keynsham, Bristol.—Receiving order made February 17th, on creditor's petition.

Trade Openings in Argentina.—The Financial Times states that the Secretary of the British Chamber of Commerce in the Argentine has written to the London agents of the Chamber drawing attention to the volume of Germany's trade with the Republic, and giving advice to British manufacturers in regard to the dispatch of samples, & ... He says:—"Postal parcels from Great Britain addressed to business houses in this country are presumed, in the absence of any special indication, to contain articles of a dutiable nature. It is a common occurrence that the addresses is mulcited to the extent of 8s. or 10s. to obtain possession of a packet containing, for example, samples of no value, catalogues, printed matter, or descriptive pamphlets. This could be avoided by the simple expedient of indicating on the wrapper the contents of such parcels. These indications should be, of course, in the language of the country, and for the convenience of British firms who may be desirons of sending their samples catalogues for who may be desirous of sending their samples, catalogues, &c., either direct to the Chamber or to individual British firms, I give the Spanish equivalents of some of the phrases in most common use:—Samples of no value—Muestras sin valor. Catalogues—Catâlogos. Printed matter, descriptive pamphlets— Impresoe.

Russia.—In his report on the trade of that Consular District in 1913, H.M. Consul at Riga (Mr. V. H. C. Bosanquet) remarks that it should be realised by British firms that the opportunity offered by the war to capture Germany's share of the import trade to Russia is one which it would be foolish to disregard. The volume and variety of manufactured goods hitherto supplied to Russia by German firms is immense, and it is quite impossible to enumerate all the different classes and sub-classes of goods in which Germany holds the field. Her position as Russia's nearest neighbour, her commercial enterprise, her extreme adaptability, and the study she has made of Russian markets, have all contributed to secure her the commercial position which she has held. bility, and the study she has made of Russian markets, have all contributed to secure her the commercial position which she has held. It is satisfactory to learn that an organised effort is being made in the United Kingdom to profit by the present opportunity, and it may be hoped that the great field for enterprise offered by Russia will not be neglected by British manufacturers and merchants. Garmany has supplied a very large proportion of the electrical machinery and accessories used in the district, the total imports of which amounted to 3,235,000 roubles in 1913. There should now be a great opening in this class of goods for United Kingdom manufacturers.

The British Vice-Consul at Archangel (Mr. T. Woodhouse) reports that an agent in that town wishes to secure the representation of United Kingdom manufacturers and exporters of fire

bricks, steel, steel tools, and electric lamps and fittings.

H.M. Consul-General at Olessa (Mr. J. F. Roberts, C.M.G.)
reports that a technical engineer at Ekaterinoslav wishes to secure the agencies of United Kingdom manufacturers of motors, boilers, pumps, technical accessories, electric light plant, &c. Communications regarding the inquiry should be addressed to the British Consulate General, Olessa.—Board of Trade Journal.

Australia.—H.M. Trade Commissioner for Australia (Mr. G. T. Milne—address, Commerce House, Melbourne) reports that a number of importing firms in Melbourne, who in the past have imported the undermentioned classes of goods from foreign sources, have requested that United Kingdom manufacturers of these goods should communicate with them:—Thermometers, mathematical instruments, X-ray tubes and apparatus, electric glow lamps, glass, glassware, bitumen.

Change of Name.—The Institute of Industry and Commerce, which was inaugurated a few months ago, has now changed its name to the Institute of Industry and Science.

Deed of Assignment.—R. D. CUNDALL (The Cundall Gas and Oil Engine Co.), engineer and ironfounder, Keighley.— Particulars of claims must be sent in by March 31st, to the trustee, Mr. J. Rhodes, 37, Manor Row, Bradford.

LIGHTING and POWER NOTES.

Australia.--The Petersham (N.S.W.) Council has inaugurated its electric lighting scheme, which includes public lighting by arc and numerous high powered metal lamps. A joint scheme of the Petersham, Leichardt and Annandale Councils to be completed in June includes 2,000, 1,000 and 300-c.p. nitrogenfilled metal lamps. Over 1,000 poles and 50 miles of cable have been used in the Petersham contract, which was entrusted to the

been used in the Petersham contract, which was entrusted to the Electric Light and Power Supply Corporation of Balmain.

The Parramstta Supply Co. has started work; some 320 incandescent and 20 1,000-0-P. lamps are installed in the streets.

The proposal of the Melbourne Council to supply free metal lamps to consumers paying an extra ½d. per unit, in place of carbon lamps, has brought a protest from the local Electrical Traders' Association. The Council at the present time supplies 65,000 carbon lamps per annum. carbon lamps per annum.

The Sydney Municipal Council has notified electrical contractors that in future it will require the provision of a red pilot lamp with any non-luminous heating apparatus, and where separate pieces of apparatus are used simultaneously a pilot lamp must be provided apparatus are used simultaneously for each.—Commonwealth Engineer.

Ballymena. - Workhouse Lighting. - The B. of G. has decided to postpone the lighting of the old infirmary with electricity for six months.

Barford.—E.L. SCHEME.—An E.L. scheme for this parish has been completed by the Barford Electric Supply Co., Ltd. For public lighting 11 lamps have been provided, and are lit for 25s. each per annum; ourrent is supplied for lighting at 7d. per unit, and for cooking, heating and power at 2d. Connections secured are equivalent to 1,784 16-c.p. lamps, and extensions to the villages of Wasperton and Sherbourne are projected.

-Proposed New Plant.--A Sub-Committee Barking. of the Electricity Committee is considering the electrical engineer's report upon the question of the extension of the plant and mains in order to cope with the increasing demand for power.

Bingley.—The Electricity and Tramways Committee has decided to accept the offer of the Keighley Corporation to maintain a continuous supply of electricity on Sunday mornings.

Blackburn,—New Power Station.—An extension of the electricity undertaking, involving the erection of a new station and equipment at Whitebirk, at a cost of £100,000, is being considered.

Brighton.—The T.C. has considered the application of the B. of G. that the energy consumed at the various premises which the Guardians have taken owing to the acquisition of the workhouse by the military authorities should be charged for at the hotel rate. The application was refused, the Electric Lighting Committee reporting that separate cables and meters had been provided for the houses taken, and owing to the increased price of coal, the question of increasing the price to all consumers would have to be considered.

-The Guardians have adopted a recom-Burnley. mendation of the Assessment Committee that Messrs. Cross and Sons, Ashworth & Morris, re-value the gas and electricity undertakings of the Nelson Corporation.

Cheshire.—The C.C. has decided to petition against the Bill of the Stalybridge Joint Tramways and Electricity Board.

Continental.—ITALY.—A little storm in a teacup has just been settled in Italy in connection with the annual tax on electricity which is in force in that country. It appears that the tax collectors in the Milan and Palermo districts recently had the bright idea of augmenting the revenue from this tax by serving a demand note for 20 lire (about 16:) on all the motorists in the demand note for 20 lire (about 163.) on all the motorists in the districts named whose cars are fitted with electric lighting installations. Their justification for the demand was that such sate were miniature electricity generating stations, and hence fell into the minimum annual tax category, this being the same as the tax on a central electricity station in a little town or village of 5,000 inhabitants. The matter was taken up with the Government by several of the leading automobile clubs in Italy, with the result that the action of the tax collectors has been declared illegal, the motorists thus again breathing freely.

Dover.—Refuse Destructor.—The T.C. has appointed a deputation to inspect dust destructors at other places, with a view to one being provided for the town.

Dublin.—Proposed Price Increase.—The Electricity Supply Committee has decided to recommend the Corporation to increase the charge by ld. per unit for lighting, and \(\frac{1}{2} \)d. per unit for power. The estimated expenditure for the next 12 months is \(\frac{2}{3}7,500 \) over that of last year, owing to coal prices, higher cost of carbons, maintenance, materials, \(\frac{1}{3} \)c. The Committee proposes also to ask the Council to reduce the rates immediately coal drops to normal prices.

By order of the Electricity Committee the number of street lamps in use after 10.30 p.m. has been reduced from 600 to 300, the object being to economise the consumption of carbons, the supply of which has been greatly interfered with by war conditions,

Frodsham.—ELECTRIC PUMPING.—The Joint Water Committee has appointed a Sub-Committee to report on the cost of working pumps by gas and electricity. The pumps are being worked at present by electric motor.

Glasgow.—The Clyde Valley Electric Power Co. is installing electricity for lighting and power in the works of the Ellangowan Paper Co. at Milngavie.

Greenock.—It was reported at a meeting of the Corporation that the output of electricity during January showed an increase of 41 per cent, over the same period last year.

Harrogate.—The Knaresborough R.D.C. has decided to consent to the application for a prov. order for electric light being made by the T.C., and has agreed to a modified scheme by which the area of supply will be extended in the Council's district. The area of the Wetherby R.D.C. has been deleted from the order on account of the attitude of the Council, and Pateley Bridge has been secured. The charges that rule in Harrogate are to be instituted for the proposed area in the rural district.

Horsham. - Refuse Destruction. - The first year's working of the destructor, according to the report of Mr. J. Morgan, the electrical engineer, shows that 104,534 KW.-hours were generated, an average of 72½ per ton of refuse burnt. The coal figures, for 1913-14 were 942 tons at £931, and for 1914-15, 678 tons at £656, showing a saving of £275, to which should be added £46 in respect of increased output, bringing the saving up to £321. Including clinker sold, and deducting financial charges, labour to the not work was £140. labour, &c., the net profit was £140.

Huddersfield,-YEAR'S WORKING.-The accounts of the electricity department for the year ended December 31st show income £52,518, and expenditure £32,422, leaving a balance of £20,095, as compared with £18,215 for 1913. Of this £1,925 is to be transferred to the depreciation and contingencies account, and \$2.100 carried forward for the relief of the rates.

The Electricity Committee has decided that the sum of £2,977 for a new switchboard, in replacement of the old one, shall be

charged to depreciation account,

Hull.—Electric Cooking.—The Electricity Committee has instructed the engineer to report on the question of supplying electricity for cooking and lighting to the houses of the working

Kingstown. — Arbitration Result. — The arbitrator (Mr. S. L. Brown) has decided that the Urban Council shall pay £3,607 to the Dublin Southern District Electric Supply Co. for the transfer of the undertaking in the town, the Council to pay all costs.

Leicester.—Public Lighting.—The Watch Committee Leicester.—PUBLIC LIGHTING.—The watch Committee of the Corporation recommends that the main thoroughfares on tramway routes be lit by electric incandescent lamps suspended in the centre of the road between the poles, and has arranged with the Tramways and Electricity Committee to undertake the lighting of the streets in question for an annual payment of £6 8s. 7d. per 600-C.P. lamp, to include the supply, repair and maintenance of mains, overhead services, fittings, and the lamps themselves, and the supply of the necessary current. It is found that for the axisting tramway routes the provision of 938 600-C.P. that for the existing tramway routes the provision of 938 600 C.P. half-watt lamps will be required, and the annual cost of street lighting will be increased by approximately £2,000 per annum, but the Committee considers the improved lighting will amply compensate for this outlay.

Liverpool.—RESTRICTED LIGHTING.—This city and the surrounding areas have now adopted a reduced scale of lighting. Pablic are lighting has been dispensed with and metal-filament lighting substituted, but the illumination of the tramway cars has not been reduced.

Llandudno. -PROPOSED LOAN. — The Council has decided to apply to the L.G.B. for sanction to borrow £1,720 for an engine and dynamo, &o., and an induced-draught plant, and is to spend £269 out of revenue on a new office, and alterations to the battery room.

London.—The L.C.C. Finance Committee recommends the sauctioning of the application of the Battersea B.C. for a loan of

A15,750, viz., £8,750 for rotary converters, switchgear and transformers, and £7,000 for H.T. feeder cables.

HAMMERSMITH.—The Electricity Committee states that a satisfactory trial has been made of the plant recently installed for pumping coal from the Council's wharf to the electricity works, and it is expected that the same will soon be in use.

The Council is recommended to take up a loan of £18,000 from the L.C.C. in connection with the electricity undertaking.

LONDON ELECTRIC SUPPLY BILLS.—The L.C.C. has notified the various Councils that consideration is still being given to the question of what further action, if any, shall be taken with regard to the supply of electricity in and near London, and stakes that any characters which the authorities of the districts con that any observations which the authorities of the districts con-cerned wish to make on the subject should be submitted as soon as possible

possible.

The Chairman of Parliamentary Committees has undertaken to ask promoters of contentious Bills before Second Reading not to proceed with their proposals. The London Electric Supply (No. 2) Bill, promoted by the West End companies, comes under this heading, as already 50 dissenting petitions have been presented. The promoters of the Bill represent only 32 out of the 117 sq. miles in the County of London, and it is being opposed by both municipalities and companies.

Manchester. — RESTRICTED LIGHTING. — The order for reduction of the lighting of streets and public buildings comes into force on March 1st. The order will affect the mills, in which many of the windows will require screening at night.

Nantwich.—The R.D.C. has deferred consideration of the question of a scheme for extending the E.L. to Wistaston, pending the result of a conference with Mr. Danton, electrical engineer, of Crewe.

New Zealand.—The Christchurch City Council having difficulty in the distribution of light and power from the Lake Coleridge supply owing to the shortage of insulators. The Dominion supplies appear to have come largely from Germany in the past, and the possibility of having insulators made in New Zsaland is being discussed, and the Christohurch Brick Co. has been approached. The Government geologist has been communicated with in cartain and the characteristics of minimum controls. with in order to accertain whether there are deposits of suitable clay in New Zealand. In the event of a favourable reply being received, there is a possibility of a new industry being established in the Dominion.

Nelson (Glam.).—E.L. SCHEME.—The inauguration of the supply of electricity by the South Wales Electrical Power Co. took place at Abernant on the 18th inst. The company will shortly give a supply in the Abercarn Urban District and in portions of the Llantrisant, Crowbridge and Penybont districts.

Plymouth.—The quarterly return of the electricity undertaking in the Devonport and Stonehouse areas, to the end of December shows that 1,778,350 units were sold producing £15,150, compared with 1,601,629 units sold and £18,855 received in the corresponding period of the previous year, an increase in receipts of £1,294.

Rawtenstall.—It is recommended by the Tramways and Electricity Sub-Committee that the charge per lamp per annum be increased to £2 5s. 9d. for 100-C.P. lamps, and to £1 18s 9d. for 50-C.P. lamps, for the year ending March 31st, 1916.

Reigate.—The R.D.C. has been asked if the Council's letter of December 29th is a formal refusal to consent to the Chipstesd and District E L. Order, in which event it is proposed to apply to the B. of T. to dispense with the Council's consent. The Council has replied that it is of opinion that nothing should be done to facilitate the granting of the order until the new Urban Council of Coulsdon and Purley was able to consider the matter, and for that reason the Council proposed to ask the B. of T. to refuse the order being applied for.

Romsey.—E.L. Scheme.—The T.C. has referred to the General Purposes Committee a proposal by a private firm to introduce electric light into the town.

Skerries (Co. Dublin), -- E.L. Scheme. -electric lighting system. introduced by Mr. W. Flanagan under an arrangement with the U.D.C., was inaugurated on Monday night.

Southend-on-Sea. - The T.C. has decided to extend the mains along the Lower Esplanade to the new swimming baths, at an estimated cost of £291.

Stirling.--Proposed Works Extension.—In view of a report by the electrical engineer that the time had come to consider the advisability of increasing the capacity of the works, the Lighting Committee is to consult Mr. J. A. Robertson (Salford) on the matter.

Tullamore.-Workhouse Lighting.-The B. of G. has been informed that the installation of electric lighting in the workhouse would effect a net saving of \$140 per annum.

-In reference to the Council's dispute with West Ham.the Hart Accumulator Co., Ltd., in regard to the amounts deducted by the company from the electricity accounts for alleged damage caused by interruptions in the supply of current, the Electricity Committee, having carefully considered certain conditional arrangements made has recommended the Council to confirm them, and to instruct the solicitors to proceed accordingly.

Willesden.—New Plant.—The Electricity Committee has had under consideration complaints from consumers with referhas had under consideration complaints from consumers with reference to interruptions in the supply. The engineer reports that in order to ensure greater security from interruptions, and to cope with the increased demand, it would be advisable to install a battery at Acton Lane; the cost would be—for buildings, £1,000; battery, £2,750; booster, switchgear and connections, £1,000; new feeder cable, £1,112; total £5,862. The Committee considers the expenditure is urgent, but in view of the present conditions is reluctant to enter into any heavy commitments, and recommends that application be made to the L.G.B. for sanction to borrow £5,862, the commencement of the works in question to be deferred for such a period as will allow completion of them before next winter. winter.

Yorkshire Electric Power Bill.—The Birkenshaw and Mytholmroyd Councils have decided to ask the Power Co. to strike them out of the first schedule of the Bill; the Bingley, Earby and Thurnscoe Councils have decided to oppose the Bill.

TRAMWAY and RAILWAY NOTES.

Ashton-under-Lyne.—The employes of the Ashton. Oldham and Hyde Tramways, the Stalybridge Joint Tramways Board and the Ashton Corporation Tramways have decided to make au effort to secure an increase of 1d. per hour in wages for all grades, on account of the greatly-increased cost of living. The employés concerned number about 300.

Australia.—In connection with the suburban railway electrification scheme, the first consignment of G.E.C. apparatus, consisting of 90 traction motors, has now reached Melbourne from America. The first instalment of new motor coaches, 120 in number, is being constructed in the Newport workshops. A number of existing cars are being reconstructed for electric traction.

Tenders were recently invited for the steel gantries for the over-head equipment, &c., of the Sandringham-Broadmeadows line. The Melbourne Tramways Co.'s lease expires in June, 1916, and

the Melbourne Tramway Trust is considering the question of negotiating the purchase of the company's buildings, cars and plant.

The Assistant Minister of N.S.W. Railways has stated that it was itended first to convert to electric traction the North Shore section from Milson Point to Hornsby. If successful it would be followed by other suburban lines round Sydney, and by the section from Sydney to Newcastle, nearly 100 miles long.

The Victorian Railway Commissioners are shortly to introduce 10 new bogie cars on the St. Kilda-Brighton line, which will contain three passenger compartments and two drivers' compartments,

and sliding central doors for the passengers' entrance.

Birmingham.—ELECTRIC VEHICLES.—Accord the Commercial Motor an order for 21-ton "Orwell" -According to tipping wagons has been given by the Corporation to Messrs.

Blackpool.—TRAFFIC RETURNS.—The tramway receipts during January were \$2,546, an increase of £399 over the previous month. The revenue from April 1st to the end of January was \$71,310, against £80,100 during the same period of the previous year. The greatest decrease followed the outbreak of war, but since the troops came in November there has been a recovery to the amount of about £100 per week.

Brighton Railway Electrification.—At this company's meeting held on Wednesday, the chairman mentioned that they were proceeding with the electrical equipment of their suburban lines, for which contracts had been placed. Their existing electrical services had shown marked expansion.

Canada.—According to the report for the year ending October 31st, 1913, of the Minister of Public Works for the Province of Ontario, there were 761'16 miles of electric railway completed, and 47'00 miles under construction of that date. Of 37 different companies, 8 were using hydro-electric power.

Continental. - SWITZERLAND. -- It is stated that 1,873 miles of the Swiss State lines are to be converted from steam to electric traction, power being derived from the wealth of water power available. The first section will include the St. Gothard Tunnel, the section being 67 7 miles in length. Current will be transmitted single-phase at 60,000 volts to various sub-stations, whence it will be distributed.—Railway News.

Edinburgh.--Experimental Cars.—The Sub-Committee of the T.C. has decided to experiment with self-propelled cars, with a view to the possible introduction either of electrically or petrol-driven vehicles.

Hull.—RATE RELIEF.—The Corporation has decided to grant \$10,000 from the tramway profits for the relief of rates, being £3,000 more than last year, and to carry forward £5,323 to the reserve fund, which will then stand at £140,000.

It is estimated that 100,000 soldiers per week have been carried

free on the cars during the last eight months, this privilege not having been withdrawn in Hull.

Leeds.—Goods Traffic.—A scheme for dealing with extraordinary traffic is under consideration; it is proposed to construct hopper wagons, to be drawn over the tramway lines by electric locomotives. The wagons are to have a capacity of 10 tons each, and a charge is to be made of about 4d. per ton-mile.

-L.C.C. TRAMWAYS ASSESSMENT.—The House Londen.of Lords, on Monday, allowed the appeal of the L.C.C. on its claim to have a reduction of the valuation of the tramways in the borough of Islington, by reason of the rateable value having been reduced by the competition of the motor. buses.

In reply to a question in Parliament by Mr. Kellaway, Mr. McKenna stated that in the last four months of 1913 57 persons were killed by motor-omnibuses, and 25 by electric tramcars in the Metropolitan Police District. In the last four months of 1914 79 persons were killed by omnibuses and 17 by tramcars.

The L.O.C. has intimated to the B.C.'s that the clause in its

Tramways Bill to which there is opposition on the ground that it would affect their veto with regard to the overhead system, would be modified to meet the wishes of the B.C.'s concerned.

Morecambe.—TRAMWAY EXTENSIONS.—The T.C. has approved of a scheme which provides for an extension of the tram-

Newcastle-on-Tyne.--Tramway Estimates. -Tramways Committee's estimates for the coming year show traffic reaches \$270,980, and a total income of £282,200. For the year just closing the estimated receipts were £255,150, but it is expected that this sum will be exceeded by at least £2,200. The total expenditure will be £160,300, an increase of £15,400 on the current year's estimate. From the surplus of £121,900 the sum of £75,000 will be required for interest and redemption, and £8,000 the sum of £75,000 will be required for interest and redemption, and £8,000 the sum of £75,000 will be required for interest and redemption. for income-tax; but as a set off to these items is £8,500 interest on investments. These figures yield a net surplus of £39,400, but a further deduction of £8,000 must be made on account of allowances to employés who are on active service. At the beginning of the current year the reserve fund stood at £94,000, £6,000 short of the amount the Committee considers should be maintained. By the end of the current year it is estimated that the shortage will have reached £22 000, a deficiency which, it is be made up by the surplus on the present year. estimated that \$34,000 will be spent during next year on renewals.

West Ham.—New Cars, Motors, &c.—The tramway manager has reported upon the provision of new tramcars, and says that he has recently succeeded in getting amended offers for the car bodies and tracks, bringing the price down to £1,145 per car, which is equal to an increase of about 15 per cent, on the

prices prevailing in 1912-13. As the undertaking is badly in need of more cars, the manager recommends the Committee to accept the tenders of the Brush Co. for bodies and trucks; British Thomson-Houston Co., for equipments and brakes; and British Westinghouse Co., for controllers, the total for the 15 cars, including spares, amounting to £17,705. The manager states that in May last year his attention was drawn to a greatly improved type of motor. It would, the manager remarks, more than pay the Corporation to replace the whole of the present equipments by an equipment of this class, which has a reserve amply sufficient to meet any growth of traffic that may reasonably be anticipated meet any growth of trame that may reasonably be anticipated during the next 10 years. The manager estimates that the saving that could be effected, after completing the change-over of the equipments, would be in the neighbourhood of £4.000 per annum, making no allowance for the benefits that are bound to accrue from fewer breaks in the service. The replacement of the equipments would take about 18 months, and cost £28,000. It is proposed to refer the matter to the Finance Committee, with a view to viding the necessary money to carry out the manager's suggestion.

York.—ELECTRIC 'BUSES.—During the past week the first of the new electric 'buses purchased by the Corporation has been running to and from Heworth, and has been well patronised. The journey is completed in about 10 minutes.

TELEGRAPH and TELEPHONE NOTES.

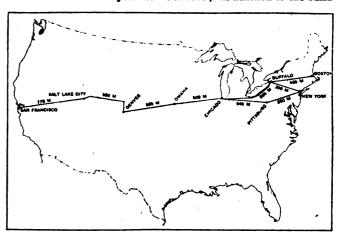

Landing Licences for Trans-Atlantic Cables. Notice is given in the London Gazette that the Commercial Cable Co. has applied to the Board of Trade for the renewal of its landing licences for submarine cables at Weston-super-Mare and Water-ville, connecting these places with one another and with North America and the Azores. On March 22nd the Board will proceed to consider the application, and in the meantime will receive any objections that may be made thereto.

London Telephones.—Answering a question in the House of Commons, the Postmaster-General stated that out of the 11,000 telephone lines in the south of the metropolitan area which were put out of service by the snowstorm on January 22nd, some 2,000 were still unrepaired. Great efforts were being made by the ngineering staff to push on the work of restoration.

Rawtenstall.—The T.C. has resolved that a scheme of street fire alarm and telephone service be adopted, and that a tender for the work be obtained from Mesers, Siemens Bros. and Co., Ltd.

Telegrams for Places Abroad.—It is announced that telegrams may now be forwarded to British New Guinea, Macquarie Island, and the Sandwich Islands, at rates varying from 2s. 3d. to 3s. 3d.

Trans-Continental Telephony.--On January 25th, previously noted in this column, telephonic communication between the Atlantic and Pacific coasts of the United States was formally inaugurated; the route of the line is shown on the accompanying map, and some particulars of its construction are given below, for which we are indebted to our American contemporaries. The line took two years to construct; in addition to the build-

ing of the section from Denver to the coast, the whole of the line between New York and Denver had to be overhauled and equipped with loading coils. The wire was hard-drawn copper 0'165 in, in diameter; one two-wire circuit weighs 1,480 tons, and in two physical two-wire circuits there are 13,600 miles of wire, carried on 130,000 poles. The phantom circuit derived from these two circuits gives the best results over long distances. The wild and mountainous character of the country in the Far West made the work of construction conditions. in the Far West made the work of construction exceedingly difficult; long stretches of the line run over swamps and deserts, and there are no roads. The loading coils are mounted on the poles. The first large city touched by the line after leaving San Francisco is Salt Lake City, 770 miles to the east. The poles are of red-wood, and usually measure 4 in. square at the top, 8 in. at the bottom, and are 18 ft. long.

The line consists of two physical circuits and one phantom circuit; all the circuits are loaded with Pupin coils 4 or 5 in in diameter, with cores of iron wire 4 mils in diameter. Beginning at Boston, the first line ran to Cambridge in 1876, and was extended to Providence, 45 miles, in 1882, and to New York, 235 miles, in 1884. The line between New York and Chicago, 900 miles, was opened in 1893, and was extended to Omaha in 1898, to Denver in 1911, and to Salt Lake City in 1913.

Belfast.-March 15th. Twelve months' supply of stores for the Tramways and Electricity Committees. Notices" February 19th.

Birkenhead.—March 9th. Corporation. Continuouscurrent meters and house-service fuse boxes. Notices " to-day. See "Official

Bolton. - March 4th. Corporation. Twelve months' supply of stores for the Electricity Department. See "Official Notices" February 19th.

Bury.—March 8th. Constructional steelwork (contract 2AA) in connection with the electricity generating station extension at Chamber Hall, and steel window frames (contract 4A). Specifications, &c. (£2 2s. for each contract, returnable) from Mr. J. Ainsworth Settle, Borough Engineer, Bank Street.

Dover.—March 9th. Electrical sundries and cables for a year, for the Harbour Board. Mr. Martyn Mowll, Registrar, Castle Street. -March 9th. Electrical sundries and cables for

Dundee.-March 3rd. Corporation Tramways Committee. Stores for a year from May next. Specification from Mr. Peter Fisher, General Manager.

Edinburgh.-March 4th. Corporation. Electric lighting installation at Labour Exchange offices (Old Corn Exchange Buildings, Grassmarket). Tenders to the Town Clerk.

Edmonton. — March 10th. Electric lamps for the B. of G. Mr. F. Shelton, Clerk, The Grange, White Hart Lane, Electric lamps for the

France.-March 17th. Two electric travelling cranes for the repair shops at Mézidon, for the Administration des Chemins de Fer de l'Etat. Particulars from the Bureaux du Service Electrique, 43, Rue de Rome, Paris (1re).

Twelve months' supply of - April 1st. Gloucester. stores, for the Electricity and Light Railways Committee. Forms of tender from Mr. F. H. Corson, General Manager, Light Railways Offices, Bristol Road.

Grimsby.—March 8th. Corporation. Two years' supply of motor-type meters. See "Official Notices" to-day.

Guildford.—Water softening and filtering plant, 50,000 gallons per hour, for Guildford Electricity Supply Co., Ltd. See "Official Notices" February 19th.

Heston and Isleworth.—March 6th. U.D.C. Twelve months supply of electrical stores. See "Official Notices" to-day.

Hudderstield.—March 2nd. Corporation. Electricians' work at new Tuberculosis Hospital. Forms of tender from Mr. K. F. Campbell, Borough Engineer.

Hull,—March 2nd. Air-space telephone cable, for the Telephone Committee. See "Official Notices" February 19th.

London.—L.C.C.—March 16th. Reconstruction of three miles of single-line tramway on the underground conduit system. Specifications, &c. (£5), from Chief Engineer, County Hall, Spring Gardens, S.W. FINSBURY.—March 1st. B.C. Six or twelve months supply of electric fittings. Forms of tender from the Borough Surveyor, Town Hall.

BATTERSEA.—March 2nd. B.C. Supply of stores for Electricity Department. See "Official Notices" February 12th.
HORNSEY.—March 16th. Meters, cables and stores, &c., for the T.C. See "Official Notices" February 19th.
Bow.—March 9th. Electrical supplies, for the Managers of the Poplar and Stepney Sick Asylum District. Forms of tender from the Clerk, Devons Road, Bow, E.

Macclesfield.—March 10th. Cheshire County Asylum, Parkside. Electrical goods for one year. Mr. Wm. Tingay, Clerk.

Manchester.—March 2nd. G.C. Railway Co. Six or twelve months' supply of wires, cables, carbons, electrical accessories, lamps and telegraph material. Mr. W. Williams, Stores Superintendent, G.C.R., Gorton.

Newport (Mon).-March 2nd. Electric light fittings, for the B. of G. Mr. A. H. Rees, Clerk, Queen's Hill.

New Zealand,-May 3rd. Electrically-driven turbine pumps of 80,000 and 100,000 gallons capacity per hour, together with direct-coupled motors. Commercial Intelligence Department, Board of Trade, London.

Pontypridd. -- March 8th. U.D.C. Twelve months' stores for Electric Light and Tramways Department. See "Official Notices" February 19th.

Spain.—Tenders have just been invited by the municipal authorities of San Pedro de Latorce (Province of Valladolid) for the concession for the electric lighting of the town during a period of 15 years.

Swindon.—March 18th. Corporation. Twelve or six months' stores for Electricity and Tramways Departments. See "Official Notices" February 19th.

Transvaal. — BETHAL. March 25th. Municipality. Supply and erection of generating and pumping plant and overhead electric distribution system. Specifications from the consulting engineer, Mr. H. Haucock, A.M.I.C.E. P.O. Box 62, Klerkedorp (deposit £1 1s.). Tenders to Town Clerk, P.O. Box 3, Bathal, Transvaal.

Tynemouth.—The Electricity Committee has resolved to enter into contracts for the supply of electrolytic and other meters during the next 12 months.

- March 2nd. Twelve months' stores and materials for the Tramways Department. Mr. F. Buckley, General Manager, Market Place.

Wrexham.—March 17th. Meters, oils, coal, &c., for the Corporation Electrical Department, for a year. Borough Electrical Engineer, Willow Road.

CLOSED.

Australia.—The Public Works Department has accepted the following tenders :-

Motors and control gear for Newcastle Government Dockyard.—Standard-Waygood-Hercules, Ltd., £2,906.

Motors and switchgear for Homebush new public abattoirs.—Australian General Electric Co., £662.

Government Contracts.—The following tenders have been accepted during the past month by the Government Depart.

Hong-Kong.—The General Electric Co. of China, Ltd., has secured the contract for all the Government requirements for Osram drawn wire tungsten lamps and electrical supplies for Hong-Kong for the year 1915.

Kettering.—The Admiralty having placed an embargo on the rotary converter being supplied by the Brush Electrical Engineering Co., Ltd., the U.D.C. has accepted the offer of the company for the temporary use of \$500 kW, rotary plant until a Siemens rotary converter of the original type can be installed, the cost of the installation of the temporary plant to be borne by the

Llandudno.—The Council last Friday accepted the tender of the Electric Construction Co., Ltd., at £425, for a dynamo, and that of Messre. Browett, Lindley & Co. for an engine for the municipal electric light works. At the previous meeting the Council had been divided on the question of introducing the Desel engine, but the Committee subsequently decided on steam plant.

London. — BATTERSEA. — The Electricity Committee reports having accepted the tender of the British Westinghouse Electric & Manufacturing Co., Ltd., to supply additional plant in connection with the supply of energy to the Nine Elms district, at \$6,525. The cable, &c., will be obtained from Messrs. Callender's Cable & Construction Co., Ltd., under the Council's contract.

HACKNEY.—The Electricity Committee recommend that the contract Messrs Pice t Council of the conditions to the the

tender of Messrs. Rice & Co., at £698, for foundations, &c., for the 5,000 kw. turbo-alternator and auxiliary plant at the Millfields Road generating station, be accepted.

HAMMERSMITH.—The Electricity Committee reports having accepted the following offers for coal:—

Myers, Rose & Co.—100 tons of Shipley, at 14s. 4d. per ton, with option to supply 1,000 tons if satisfactory: 100 tons of Kirkby Nottingham slack, at 13s. 3d. per ton.

Cory Bros. & Co., Ltd.—2,400 tons of Kirkby Nottingham slack, at 13s. 6d. per ton: **001 tons of Gedling, at 13s. 6d. per ton.

Bouth Metropolitan Gas Co.—100 tons per week, until December 31st, 1915, of coke breeze, at 7s. per ton.

Wandsworth, Wimbledon, Epsom, & District Gas Co.—1,850 tons of coke breeze, at 7s. per ton.

The Committee recommends that the tender of the Cadogan Iron Works, at £42, be accepted for replacing the troughing of the Bennis coal-conveyor at the electricity works.

WILLESDEN.—The District Council has been recommended to accept the tender of the British Thomson-Houston Co. at £665, for renewing the H.T. switchboard at the Salusbury Road substitution etation.

Rawtenstall.—The T.C. has resolved that the specification of Messrs. Siemens Bros. & Co, Ltd., for the supply and installation of a proposed new street fire-alarm and local telephone service be accepted, and their tender for carrying it out be adopted.

-Messrs. Nobel's Explosives Co., Ltd., have Scotland.placed an order with Messrs. Johnson & Phillips, Ltd., for overhead power mains for their factory in Scotland.

Ship Lighting.—The Booth S.S. Co. has placed a contract with the Edison & Swan Co. for Royal Ediswan metal-filament and carbon-filament lamps.

Southend-on-Sea.—The T.C. has accepted the tender of Messre E. & H. Davey, of Southend, for the erection of a substation at Thorpe Bay, at £4,695.

Walthamstow.—The U.D.C. is recommended to pay, as from February 1st last, an extra 1s. 6d. a ton on the contract with Messrs. Usher & Co., Ltd., for the supply of coal to the electricity works.

The Finance Committee has considered letters from the various contractors to the Electricity Department, and has recommended the acceptance of the following tenders, for the 12 months commencing April 1st, in respect of the items they are willing to supply

on the same terms as at present:—Liverpool Electric Cable Co., Dussek Bitumen Co., B.I. & Helsby Cables, Electrical Mfg. and Supplies Co., C. C. Wakefield & Co., Stern Sonneborn Oil Co., A. B. Gross & Co., Vacuum Oil Co., W. Wood & Co., Anti-Attrition Metal Co., L. Andrew & Co., Imeson & Finch, Docker Bros., Robert Kearsley & Co., J. H. Tucker & Co.

FORTHCOMING · EVENTS.

Physical Society of London.—Friday, February 26th. At 5 p.m. At Imperial College of Science, South Kensington. Papers on "Magnetic Character' Figures, Antarotic and International," by Dr. C. Chree, F.R.S.; "The Electrification of Surfaces as Affected by Heat," by Dr. P. E. Shaw; "Electromagnetic Inertia and Atomic Weight," by Prof. J. W. Nicholson.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, February 26th. At 7.30 pm. At Bolbec Hall, Newcastle-upon-Tyne. Report on "The Progress of Reform in the Engineer Branch of H.M. Navy," by Mr. D. B. Morison. Paper on "The Future of British Engineering and Shipbuilding" will also be read.

(Graduates' Association.)—Saturday, February 27th. At 715 p.m. Paper on "Electric Lighting and Power for Shipe," by Mr. O. Holmes.

Association of Mining Electrical Engineers (South Wales Branch'.—
Basurday, February 37th. At 6 pm. At Carton Café, Queen Street,
Cavdiff. Paper on "Typical Breakdowns in Colliery Electrical Plant and
their Prevention," by Mr. L. Foster.

Royal Society of Arts. -- Monday, March 1st. At 8 p.m. At John Street, Adelphi, W.C. Fothergill Lecture (III) on " Motor Fuels," by Prof. V. B.

Society of Engineers.—Monday, March 1st. At 7.86 p.m. At Institution of silectrical Engineers, Victoria Empanament, W.C. Paper on "Running Costs of Motor Vehicles," by Lieut. R. W. A. Brewer.

Roentgen Society.—Tuesday, March 2nd. At 8.15 p.m. At Institution of Erectrical Engineers, Victoria Embankment, W.C. Paper on "The Chemistry of the Radio Elements," by Mr. A. Fieck.

Institute of Marine Engineers.—Tuesday. March 2nd. At 8 p.m. At Tower Hill, Minories, E. Paper on "Tail Shaft Lubrication," by Mr. A. J. Lebeds.

A. J. Lebeds.

Institution of Electrical Engineers (Birmingham Local Section).—
Wednesday, March 3rd. At 7.30 p.m. At the University, Edmund Street.
Paper on "Electricity Applied to Mining," by Mr. C. P. Sparks.
(Newcastle Local Section).—Monday, March 1st. At 7.30 p.m. At
Mining Institute. Paper as above, by Mr. Sparks.

Nottingham Society of Engineers.—Wednesday, March 8rd. At the Weibeck Hotel, Milton Street. Paper on "Town's Gas—Its Manufacture and Varied Uses," by Mr. G. Stevenson.

Greenock Electrical Society.—Thursday, March 4th. At 7.45. At 21, West diewart bitest. Paper on "The Operation of a Large Electric Supply System," by Mr. G. Macdonald.

Royal Institution of Great Britain.—Saturday, March 6th. At 3 p.m. At Albemaria street. W. Lecture (III) on "Recent Researches on Atoms and Ions." by Sir J. J. Thomson, F.R.S.

Monday, March 1st. 'At 5 p.m. General Meeting.

Salford Technical and Engineering Association.—Saturday, March 6th. At 7 p.m. At Royal Technical Institute, Peel Park. Paper on "The Strength of Iron Castings," by Mr. E. L. Rhead.

NOTES.

- An inquest was held at Oldham, Faculty.—All inquest was field at Oldham, On February 19th, touching the death of Harold Wood (21), electrician.

—Tom Ryan, a tinsmith employed at Messre. As Lees & Co.'s works, Derker Street, Oldham, said that on the previous Wednesday the electricity was off until 2 p.m., and at that time deceased went to the main switch to turn the current on and then to set the motor going. In starting, it find in the free her. went to the main switch to turn the current on and then to set the motor going. In starting, it fired in the fuse-box. Deceased knocked off the switches of the motor and got hold of a fuse, and a few seconds afterwards staggered back and collapsed on the floor.—Charles Tucker, an electrical engineer at the works, said deceased worked under him and he regarded the affair as purely accidental. He was doing work he should have done, but not in the manner in which it should have been carried out. When the wire fused in the box deceased should have gone to the main service switch and pulled it out, as he had done on a previous occasion on similar faults. Deceased had been with the firm since June, 1913.—The Coroner (Dr. Carson) said the young fellow had evidently done what he ought not to have done and without doubt the affair was an accident. A verdict of "Accidental death" was returned.

Copper.—It would be anticipated that supplies of copper should show a temporary falling-off in quantity just at the present time, but an examination of the mid-mon hly as tabulated by Messrs. Merton, does not confirm this impression. The European visible supplies, at 35,567 tons on February 15th, are 442 tons higher than for the end of January. English stocks are 83 tons less than on the same date, the increase being made up on

Chile and Australian shipments.

In classified supplies American shipments to Europe are, so far as can be judged from mid-monthly statistics, low, but equal to those for September and October, and higher than those for August, November or December. Spain and Portugal have sent a quantity equal to the average pre-war supply, while the supply under the heading "Other Countries" is considerably above the peace average. Chile shipments are higher than in normal times and Australian show better than for the preceding four months Total deliveries for the half month, if continued at the same rate, would give a quantity for the month considerably exceeding that for October and November, and only beaten by last month out of all the six preceding ones

Changes in the Board of Trade Returns .-Changes in the Board of Trade Returns.—Commencing with January, various changes have been made in the classification adopted in the monthly import and export returns as issued by the Board of Trade. The following are the alterations made in connection with the electrical industry. First, as regards imports: electricity meters and measuring instruments, as also switch-boards, which have hitherto been included under the general heading of "Electrical Goods and Apparatus, unenumerated," are now shown separately. Similarly, the old heading of "Machinery, Electrical of all kinds," has been divided into two sections: (1) Generators and motor-cycles), and (2) unenumerated. On the export side the following are now given separate headings in the division relating motor-cycles), and (3) unenumerated. On the export side the following are now given separate headings in the division relating to "Electrical Goods and Apparatus": (1) Meters and measuring instruments, (2) transformers, and (3) switchboards. The classification, "Machinery, Electrical of all kinds," has been sub-divided into three sections: (1) Railway and tramway motors, (2) other generators and motors (except for aeroplanes, motor-cars and motors and (2) negatives. motor-cycles), and (3) unenumerated.

Institution and Lecture Notes.—Institution of Civil Engineers.—On Tuesday last a paper was read on "The Electrolytic Action of Return Currents in Electric Tramways on Gas and Water Mains; and the Beet Means of Providing against Electrical Disturbances," by Mr. H. E. Yerbury. The author reviewed and criticised the Board of Trade Rules and Regulations and their revisions, from 1894 to the present date, and dealt with the influence of a leakage current on reinforced concrete. The preventive measures proposed by British and Continental authorities in order to reduce the potential differences between tramway tracks and pipes were classified, and a description of the function of a negative booster was given in detail. The author stated that where the rails and the mass of earth were positive to pipes in the vicinity of the track, there could be no danger to pipes in that area, as they were cathodic. On the other hand, danger existed to all pipes and metallic structures (where embedded in soil) which were positive to the rails, as it was the flow of current out of the pipes Institution and Lecture Notes.—Institution of all pipes and metallic structures (where embedded in soil) which were positive to the rails, as it was the flow of current out of the pipes that had a tendency to cause corrosion and pitting. The danger, however, was nothing like as great as would appear from the theoretical standpoint. He pointed out that as current-density and duration of current were the most important factors in connection with injurious electrolytic action on gas or water piper. nection with injurious electrolytic action on gas or water pipes, potential readings were misleading; it was well known that where a comparatively high difference of potential existed, there was, as a rule, less injurious current passing. In his opinion, the Board of Trade regulations in respect of leakage currents could easily be complied with on all tramway undertakings, and were absolutely effective in safeguarding the property of other authorities. Up to 600 volts could be allowed between overhead conductors and earth, and this increase of voltage would reduce the cost of feeders and also the heavy currents now dealt with

600 volts could be allowed between overhead conductors and earth, and this increase of voltage would reduce the cost of feeders and also the heavy currents now dealt with.

Society of Engineers (Inc.).—Mr. Sherard Cowper-Coles has been elected a vice-president of the Society, to fill a vacancy.

Manchester University.—In the course of a lecture on February 18th at the Manchester University, Mr. S. L. Pearce, chief engineer to the Manchester electricity department, remarked upon the increase in the supply of electricity in this country. In 1904, he said, there were 380 undertakings, producing 450 million units of energy for lighting and power purposes. In 1914 there were 502 undertakings, producing 1,636 million units. To be added to this, according to the latest returns, there were 586 million units supplied for tramway purposes, and 253 million units for the railways. The Manchester district had fully shared in this increase; in 1904 the output was 38 million units, with a maximum demand of 17,390 kW., and in 1914 it was 154 million units with a maximum demand of 50,000 kW.

S.A. Institute of Electrical Engineers.—The report for the past year shows that the income was £697, and the expenditure £426. The net surplus for the year was £137, and the credit belance amounted to £590, as against £454 a year ago. The membership was 236, compared with 278. In view of the unsettled times through which the country has passed, due to the strikes in 1913 and 1914, and to the war and rebellion, the Council regards the present position of the Institute as very satisfactory.

Roval Irish Academy.—In a paper read at a meeting of the

the present position of the Institute as very satisfactory.

Royal Irish Academy.—In a paper read at a meeting of the Academy in Dublin, on "Some Electrical Properties in Thin Layers," Mr. A. J. McClelland pointed out that thin layers of such Layers," Mr. A. J. McClelland pointed out that thin layers of such substances as graphite or bronze powder, formed on insulating materials, exhibited remarkable electrical properties. Although when newly prepared these layers might be almost non-conductors, when subjected for an instant to a strong electric field normal to the surface, and applied through the insulator, they became conducting. The paper dealt further with the laws obeyed by the conductivity, and discussed the difference between these effects and

conductivity, and discussed the difference between these effects and the coherer effect.

National Association of Colliery Managers.—In a paper on "A Year's Experience with the Miner's Electric Lamp," read before the North Stafforbhire Branch at Stoke-on-Trent, Mr. Caleb Johnson said that when the lamps were first installed in the collieries difficulty arose in persuading the men, especially the older ones, to take kindly to them, the objection being the additional weight. That was soon overcome, however, and he was of opinion to-day that another pound in weight, or even more, might be added without objection from the miners, thereby giving facilities to increase the illuminating power of the lamp. The introduction of a lamp with greater illuminating power, in his opinion, tended to reduce the number of cases of miners' nystagmus. During 1913, at the colliery with which he was connected, they had a number of persons afflicted with the disease, but during the year 1914 they had none. They kept several spare lamps, and

when they suspected a workman of suffering from, or developing, nvstagmus, they gave him an electric lamp. Now they were renystagmus, they gave him an electric lamp. Now they were re-ceiving repeated testimony from the men that they could do their work in greater comfort, and read the newspaper at home in the

work in greater comfort, and read the newspaper at home in the evening without their eyes or heads aching in doing so.

Association of Mining Electrical Engineers.—At a meeting of the West of Scotland Branch held in the Royal Technical College, Glasgow, on February 20th, a paper was read by Mr. A. Smellie, New Cumnock, on "Experiences in Handling Colliery Electrical Plant." The author stated that when a new company was formed to work the New Cumnock collieries, it made arrangements for an installation of electrical plant for the pumping, coal for the pumping, and so the control of the pumping and so the pumping and the pumping cutting, haulage and auxiliary ventilation below ground, and for the driving of a washer on the surface. The plant consisted of two three-phase generators driven by steam impulse turbines with two three-phase generators driven by steam impulse turbines with condensers, each capable of developing 1,000 km. at 3,000 R.P.M., 3,000 volts, 50 cycles. The neutral was insulated. The generators were run alternately, as one was quite sufficient for the work. A big proportion of the current was used for pumping, which was carried out mainly by means of turbine pumps driven by three-phase squirrel-cage motors. Prior to the introduction of these the water was dealt with by every conceivable kind of pump. Breakdowns were numerous, and idle time was common, but since the installation of electric pumps not a single shift had been lost due to the breakdown of the pumping plant. While electricity had many advantages as a medium for single shift had been lost due to the breakdown of the pumping plant. While electricity had many advantages as a medium for operating haulages on long roads, it was as a motive power for auxiliary or face haulage that the writer thought it showed its greatest utility. Small electric haulages which were light in themselves, and were easily shifted about, could be cheaply installed. It an experience extending over a period of 10 years with small haulages, and some of fairly large size, he had not lost a shift due to the breakdown of electric fittings. In the pits at New Cumnock they had coal cutters working on all gradients up to 1 in 2 with complete success, and he would not have the slightest hesitation in applying them to even a greater inclination than that. There was no doubt about the efficiency and economy of a central generating doubt about the efficiency and economy of a central generating station where a number of pits within a given radius had to be supplied with current, but those contemplating such an installation would be well advised to have nothing but plant of the very best construction. With machinery well designed, well housed, well supervised, and with cleanliness the dominating factor, repairs should be negligible and the measure of reliability equal to that of any machinery about a colliery. Changing from steam to electricity any machinery about a colliery. Changing from steam to electricity should be gone about slowly and regularly. If one motor after another was added by degrees, the men were trained as the system developed, while, on the other hand, if a dozen motors were dumped down at a time when the men were strange to the work, little things that would ultimately be considered of no consequence were regarded as mountains of difficulty, quite sufficient to prejudice many against the system.

At the meeting of the Notes and Darbacking Dozenta A. V. A. V.

At the meeting of the Notts. and Derbyshire Branch at Nottingham, on Saturday, a paper on "Typical Breakdowns in Colliery Electrical Plant, and their Prevention," was read by Mr. Llewellyn

Institution of Mechanical Engineers.—The annual report of the Council shows that the membership has increased from 6,346 in 1913 to 6,400 at the end of 1914. The total revenue for the year was £16,971, and the expenditure was £15,521. After deducting items credited to capital there remained a balance of £966. The capital of the Institution, less debentures and loans, &c., amounts to £69,273. The Benevolent Fund stands at £5,467.

Institution of Electrical Engineers.—At the meeting of the Manchester Local Section on Tuesday last, a paper was read by Mr. A. P. M. Fleming on "Training for the Industrial side of Engineering," and a discussion followed.

At the meeting of the Yorkshire Local Section on Wednesday last a paper was read by Mr. C. P. Sparks on "Electricity Applied to Mining," and was followed by a discussion.

Appointments Vacant.—Mains assistant (35s.), for Radeliffe U.D.C.; switchboard attendant (30s.), for Portsmouth Corporation; sub-station attendant for Walsall electric supply department; assistant engineer, for Stafford electricity department; switchboard attendant also wireman, for Blackpool Tower control attendant (51) for Harmond electricity department. Co.; switchboard attendant (£1). for Heywood electricity works; switchboard attendant (32s.), for Borough of Bermondsey; works superintendent for West Ham Council (£250). Particulars are given in our advertisement pages

Patents and Alien Enemies. — Letters Patent Nos. 10,859/01 and 21,439/02, granted to Goldschmidt for the Thermit process, have been avoided by the Board of Trade, on the application of Mesers. W. T. Turner and H. A. Blackwell. The hearing was reported in our issue for November 6th, 1914. In respect of Patent No. 7,995/02, granted to Jensen, Mr. G. Jones has been granted a licence. been granted a licence.

London Electrical Workers.—The following para-

London Electrical Workers.—The following paragraph appears in the Herald for February 20th:—
"Evidently the London members of the Electrical Trades'
Union are not believers in the righteousness of being sweated for the sake of patriotism disguised as profit. The right to live under decent conditions and at fair rates is just as important, perhaps more so, now than in times of international peace, and London electrical workers realise this to the full. They are demanding an increase in wages to 1s. per hour and a 48-hour week from their bosses—and they will get it by force if need be."

(Continued on page 293.)

(Continued on page 293.)

THE ELECTRICITY SUPPLY TO PORT GLASGOW FROM GREENOCK.

THE history of the Greenock Corporation electricity department has been one continuous record of expansion, and the extension of the electricity supply into the neighbouring Burgh of Port Glasgow in November last is the logical outcome of the enlightened policy which has always

distinguished this undertaking.

The department has been fortunate both in its chief engineers and in the Committees which bave been entrusted with its management. They have endeavoured to maintain the price of electricity for power purposes at the lowest possible level, believing, quite rightly, that the interests of all classes of the community are better served by enabling engineers, shipbuilders and manufacturers successfully to com-pete for work, and so bring trade to the town, than by

making large profits, which would only, at the best, take a half-penny or a penny off the rates.

The direct result has been that practically every power user in the town is a consumer, and last year the department few years by the shipbuilders and engineers of that town, but their Council always put so many obstacles in the way that the project had to be dropped each time.

The cause of the disagreement between the two burghs In the days when the Clyde is about a century old.

was only a shallow stream unfit for navigation, the City of Glasgow leased a tract of land on the lower reaches of the river, built harbours there, and called it Port Glasgow.

Greenock, a small fishing village three miles lower down the river, was better

situated, and private enterprise under the patronage of the local Laird built larger and more commodious quays and harbours, and soon all the trade of Port Glasgow passed into the hands of its neighbour. Ever since then, the Town Council of

Port Glasgow has been haunted by the fear of annexation by its larger neighbour, and all overtures from Greenock for the supply of water, gas, or electricity have been met with uncompromising obstruction.

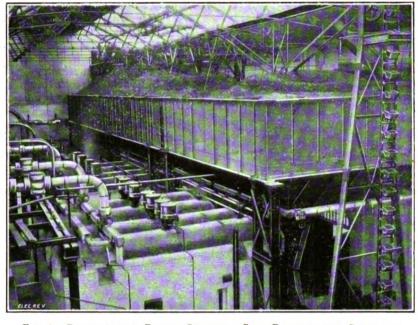

FIG. 1.—DELLINGBURN POWER STATION: COAL BUNKERS AND CONVEYOR.

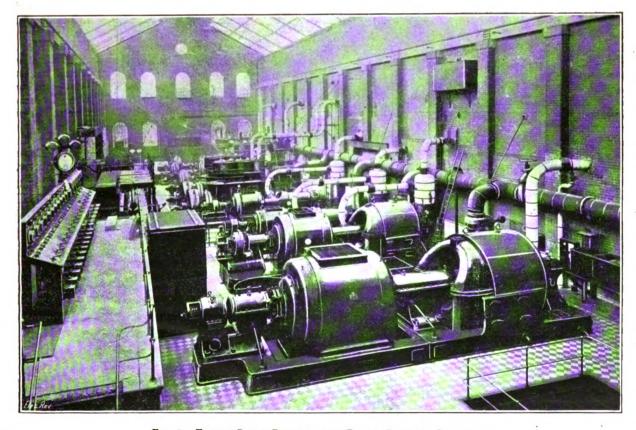

FIG. 2.—Engine Room, Dellingburn Power Station, Greenock.

sold 136 units per head of population, a figure exceeded by only one other undertaking in the United Kingdom.

The question of a supply of electricity to the Burgh of Port Glasgow had been raised several times during the last

Most of the shipbuilders in Port Glasgow had their own generating stations, but with the possibility of cheaper power being available from Greenock these had not been extended to cope with the increased demands of modern shippard work. The boom in shipbuilding recently brought matters to a crisis; a Committee of power users was formed,

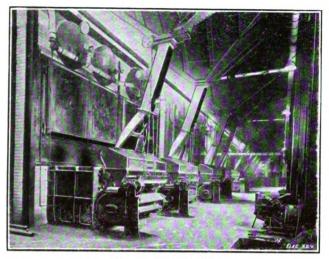

FIG. 3.—BOILER HOUSE.

and as they were the largest ratepayers in the burgh, they were able to put pressure on their Council, and so the

negotiations were brought to a successful conclusion.

Greenock has now taken over the Port Glasgow electric lighting order, and will supply Port Glasgow consumers on exactly the same terms as those offered to similar consumers in Greenock. the event of a dcficit, the Greenock Corporation may not levy rates in the Port Glasgow area, but to safe-guard the department, the six principal shipbuilding firms in the burgh have signed a minimum guarantee and also an agreement Date.

FIG. 4.-PUMP HOUSE.

to take all their electricity from Greenock for the next 29 years. The town of Port Glasgow lies along the narrow strip of

land between the River Clyde and the steep hills, which rise almost immediately from the water's edge. All the principal consumers have their shipyards in a line along the sea front, so that the problem of power distribution has been very much simplified.

With one exception, all the electrical plant of the various firms is suitable for a 250-volt supply, so that three 250-volt rotary sub-stations have been erected in the burgh, one at the Greenock boundary, one in the centre of the town and one on private premises at the far boundary.

The first two are public sub-stations operated by the electricity department, and supply both the town and the shipyards and engineering works lying between. A 1 sq. in. low-pressure, two-wire concentric trunk cable connects the two stations and loops into the principal shipyards, where links are provided so that each yard can be fed from either sub-station in the event of a fault occurring anywhere in the trunk cable

At regular intervals along this trunk cable distributing pillars are installed, from which cables are run for the supply of smaller consumers. The system of distribution throughout Port Glasgow is two-wire.

The trunk cable between the sub station in Bay Street (centre of town) and the sub-station in the Clyde Shipbuilding and Engineering Co.'s yard at the other boundary is 1 sq. in. up to Messrs. Ferguson Bros.' ship-yard, and 5 sq. in. thereafter. In addition to these three sub-stations there is a sub-station in Messrs. Wm. Hamilton and Co.'s yard. The reason for this separate supply is that Messrs. Hamilton's pressure for power is 420 volts.

The sub-stations are fed by two 10,500-volt E.H.T. three-core 1 sq. in. cables which loop into alternate sub-stations, thus forming a high-tension ring main about $6\frac{1}{2}$ miles long.

All the high-pressure feeders and low-pressure distributing mains for this extension were manufactured by M. ssrs. Callender's Cable and Construction Co., and the cables have been laid on both the solid and the draw-in systems.

The Boundary Street sub-station consists of two bays; in one are placed the switchgear and the rotaries, and the other is to be used as a battery room. The high-tension cubicles and all the switchgear in this station were provided by the British Thomson-Houston Co., Ltd., and the two 500-kw. rotary converters and transformers were

supplied by the British Westinghouse Electric and Manufacturing Co, The rotary Ltd. converters are of the eight - pole compound-wound selfsynchronising type, and are supplied with six-phase current at 185 volts, 50 periods. They have an overload capacity of 50 per cent. for three minutes, and the full-load efficiency for rotary and transformer is 92 per cent. The Bay Street sub station is a duplicate of the Boundary Street sub-station as far as plant is concerned.

the Clyde Shipbuilding and Engineering Company's sub-station there is one 500-kw. rotary converter, and

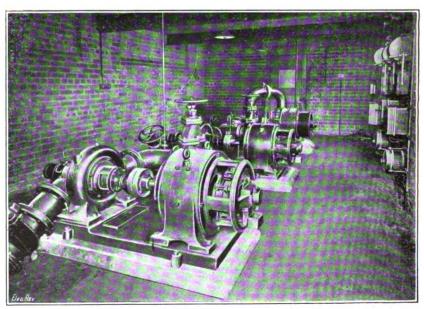

Fig. 5.—Cooling Tower Circulating Pumps.

the high-tension cubicles and switchgear, as well as the transformer and rotary converter, are of the British Westinghouse Co.'s manufacture. In Messrs. Wm. Hamilton

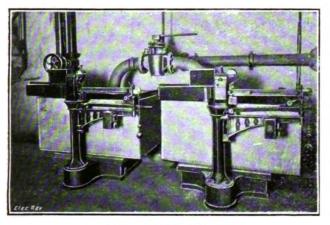

FIG. 6.-TESTING TANKS.

and Co.'s sub-station there is one 500-kw. rotary converter, which, however, is wound for 420 volts, and is of the British Westinghouse self-synchronising type. The switch-

gear in this station is of the British Thomson - Houston Co.'s manufacture.

In all four substations provision has been made for doubling the capa-city of the plant now installed.

An extremely interesting collection of private generating plant has been displaced by the Corporation supply.

Messrs. Dunlop, Bremner & Co. had two modern steamdriven dynamo sets; these have been taken out and a 1 sq. in. concentric feeder from the Boundary Street sub - station provides all the necessary power.

Messrs. Russell & Co, shipbuilders, have two dockyards. Their Kingston Yard, which is opposite the Boundary Street sub-station, was supplied from three modern steamdriven dynamo sets; these have been sold, and the yard is fed by two 1 sq. in. concentric cables. In Messrs. Russell and Co.'s other yard, the original generating sets were two Crompton dynamos, driven by vertical gas engines. These engines gave a great deal of trouble to start, and were very often kept running on no load simply because of the diffi-culty of restarting. The Greenock Corporation latterly loaned the firm a large motor starter, so that the gas engine could be run up by motoring the dynamo. This yard is fed by two 1 sq. in., and one 5 sq. in. concentric cables.

The Clyde Shipbuilding and Engineering Co. had the finest assortment of suction gas plant of any of the Port Glasgow shipbuilders. Their plant consisted of one 110-kw. compound dynamo by Meisrs. J. P. Hall & Co., rope driven from a National gas engine; two 87.5-kw. compound dynamos by the British Westinghouse Co., rope driven from two Premier gas engines; and one 225-kw. compound dynamo by the British Westinghouse Co., direct driven at 160 R.P.M. by a Premier gas engine. The firm had also installed a 75-kw. dynamo by Messrs. Dick, Kerr & Co., driven by a Robey highspeed engine, so that the lighting of the works might be assured. A sub-station with a 500-kw. rotary converter has been erected on this firm's premises.

Messrs. Duncan & Co. have no generating plant of their

own, but expect to take a minimum of 100 kw.

Messrs. Ferguson Bros., Ltd., shipbuilders and engineers, have two small gas engine sets which are fairly modern. Their demand also was estimated at a minimum of 100 kw., but owing to a recent fire which has completely destroyed their machine shops, they have intimated that an increased demand may be expected from them when the damage is made good.

Messrs. Wm. Hamilton & Co., shipbuilders, had a power plant consisting of a couple of two-pole low-speed sets sold out of Dickinson Street, Manchester, many years ago.

These and other superseded sets are illustrated on p. 292. Messrs. Murdoch & Murray, shipbuilders, have also splaced a gas-engine set. They have not signed an displaced a gas-engine set. exclusive use contract with the Corporation, but are taking energy for all power and lighting purposes at ordinary rates.

In addition to these eight shippards and engineering works, the Kingston Investment Co., which bought up the slum area of the burgh and built model houses and shops, have displaced their own generating plant and have entered into an agreement with the department to take 50 kw.

The Caledonian Railway Co., who have just rebuilt

their station at Port Glasgow, have adopted electric lighting and propose to use electricity for signal lighting also.

With all these exclusive, use guarantees for 29 years, the extension of the electricity supply into Port Glasgow should prove a splendid venture for the Greenock electricity department, while it meets at the same time an undoubted need in the Port Glasgow area.

To crpe with the demands of Port Glasgow, and also to meet the increasing load in Greencck, extensive

alterations have recently been carried out at the generating

station in Dellingburn Street. A switch annexe has been built

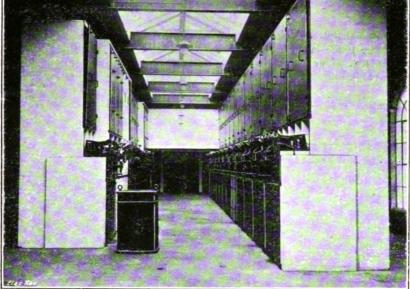

FIG. 7.—HIGH-PRESSURE SWITCH CUBICLES, DELLINGBURN POWER STATION,

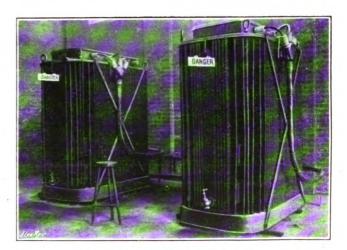

FIG. 8.—10,500-VOLT TRANSFORMI RS.

at the end of the engine room with a complete equipment of Westinghouse cubicles and solenoid-operated remote-control switchgear to operate the high-pressure alternators and

feeders. These displace the existing high-pressure switchgear in the engine room, and their place is now occupied by a control desk.

Two 1,000-KVA. Westinghouse oil-insulated self-cooling transformers, with a ratio of 3,300 to 10,500 volts, are used

to step up the station voltage for the Port Glasgow supply. Under normal conditions one transformer is used on each feeder, but the switching arrangement is such that one transformer can be used on both feeders, or two transformers can be used on one feeder.

Owing to the heavy load which has already been connected in Port Glasgow, two more 1,000-KVA. transformers, duplicates of the original pair, are now on order, so that two transformers in parallel may be permanently connected on to each feeder. The switches controlling these feeders are hand operated.

A turbo-alternator set of 5,000 kw. capacity has also been installed, thus bringing the total plant capacity of the power station up to 11,300 kw. (four turbo-alternators totalling 9,000 kw. and four reciprocating D.C. sets totalling 2,300 kw.).

This last set consists of a Westinghouse Rateau impulse

motor has been connected to the two 250-volt machines, thus providing 750 kW. of converting plant in the main power station, which can be used as a balancer; the 500-volt machine has been coupled to another 3,300-volt 750-kW. induction motor, and the set has been installed in the

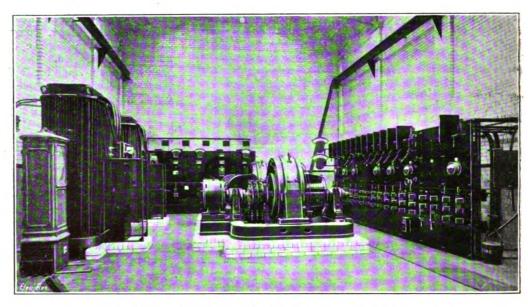

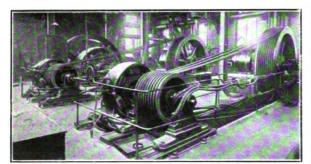

FIG. 9.—BAY STREET SUB-STATION, PORT GLASGOW.

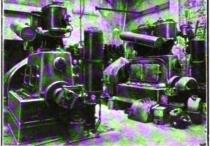

original Hunter Place station, which is now used entirely as a sub-station. In addition to this 750-kw. motor-generator, there are in this sub-station two 500-kw.-volt Westinghouse rotary converters and transformers.

Two 18,000-lb. Babcock & Wilcox boilers have been added, bringing the total number of boilers up to 12, including

the three destructor boilers, and the overhead coal bunkers and conveyor have been extended to include these additional boilers. To make room for a large economiser to meet the requirements of the increased plant, the original pump room at the end of the boiler house has been removed and a new pump room has been erected. The pumping plant consists of one 7,000-gallon Rees Roturbo rotary pump,

turbine running at 1,500 R.P.M. and driving a 3,300-volt, 50-cycle alternator of the compensated type. A Sturtevant wet air filter is provided, and the condenser is operated by a turbine-driven air pump of the Le Blanc type.

Further converting plant has been provided by separating a 750-kw. motor-generator set, which consisted of two 250-volt and one 500-volt D.C. machines coupled together on the same bedplate and used as a motor balancer. Instead of the 500-volt machine, a 3,300-volt 750-kw. induction

one 10,000-gallon and one 4,000-gallon Weir double-acting vertical pumps, one 10,000-gallon and one 7,000-gallon Weir latest type rotor feed pumps. Above the pump room is situated the Paterson oil-eliminating plant, while in the basement below the pump room are placed the two hot wells, one for turbines and one for reciprocating plant. In the basement is also located the apparatus for measuring the condensed water from any one of the generating sets in the station. Two large

tanks are mounted on Avery weighing machines, and the condensed waterpipe is made to terminate above and between these tanks. A two-way cock and tee-pipe are fitted by which the water can be directed into either tank. When a generating set is to be tested, the condensed water from the set is directed by means of selector valves into the pipe connected to the tanks. When one tank is filled, the weighing machine is balanced, and the weight is then automatically stamped on a card, after which the tank is emptied by a valve in the bottom. Meanwhile, the next tank is filling, and the process is repeated continuously during the period of test. The load on the machine is kept fairly constant, and the units generated during the test are noted, and the consumption per kw.-hour at that load is thus easily obtained. The performance of each generator is checked in this manner at frequent intervals.

Two Lea recorders have been installed. One records the total boiler feed, while the other is connected in circuit

with the 5,000-kw. turbo-alternator set.

A Sanders Rehders steam meter is installed to record the steam delivered from the refuse destructor boilers, and the British Thomson-Houston Co.'s steam meters are to be fitted to several of the boilers.

Although Greenock is favoured with a remarkably good power load, the possibilities of the domestic load have not been neglected. Energy for heating and cooking purposes is sold at a flat rate of \$\frac{1}{4}\text{d.}\$ per unit if metered separately, but where this is not possible an "annual charge" tariff may be adopted by which the consumer pays a fixed sum per quarter based on the lighting maximum demand, and all units registered by meter for both lighting and heating pur-

poses are charged at \$d. per unit.

Over a year ago, the Corporation opened large showrooms in the main thoroughfare for the use of its hiring and publicity section. This department was inaugurated in 1904 for the hiring of lighting installations and motors, and already 383 lighting installations and 160 motors have been fitted up on this system. Lately, the scheme was extended to include cookers, &c., and of these the department has installed 56 cookers, 162 radiators, and 186 irons, kettles, &c. As showing the necessity for the Corporation's policy of providing facilities for hiring electrical appliances, it may be pointed out that out of the total of 1,650 consumers on the mains, no fewer than 453 have been introduced to the undertaking through this hire and hire-purchase department, and these represent a demand of over 1,700 kw. distributed among houses, shops, factories, and workshops.

As an indication of what can be done in developing the heating load when tariffs are favourable, it is only necessary to mention that during the three months ended December 31st, 1914, the department sent out on the hire-purchase system 58 radiators, 19 irons, and 11 kettles, making a total increase in the connections to existing services of 103 kw.

The development of the undertaking during the 15 years of its existence is shown in the following table, which gives the data for the fifth, tenth and fifteenth years of operation :-1908-04. 1908-09. 1918-14. Units sold 1,413,783 3,495,852 11,451,438

Average price obtained per unit Total cost per unit, pence 2 00 1 25 1'45 '825 1 04 610 Mr. J. A. Robertson, the late engineer (now borough

electrical engineer of Salford) was responsible for the Port Glasgow extension scheme, and the new engineer, Mr. Frank H. Whysall, has put the scheme into operation on the

lines planned by his predecessor.

Owing to the large amount of Admiralty work carried out in Greenock, the demand for power has risen to such an extent that further extensions are urgently required. These include a new 5,000-kw. turbo-alternator set, the erection and equipment of a rotary converter sub-station in the east end of the town to relieve the overloaded feeders in that district, the installation of another 500-kw. rotary converter in Messrs. Scott's Engine Works sub-station, the laying down of a new 0.6 sq. in. feeder to the centre of the town, and the erection of large economisers and flues at the power station.

We are indebted to Mr. Frank H. Whysall, M.I.E.E., for the foregoing information regarding the undertaking, and to Mr. John H. Parker, his chief assistant, for the photographs with which this article is illustrated.

NOTES.

(Continued from page 288.)

Parliamentary.—London County Council's Tramways Bill—The Select Committee on Standing Orders have agreed that the London County Council Tramways and Improvements Bill be allowed to proceed on condition that Tramways Nos. 3 and 3A are struck out of the Bill.

struck out of the Bill.

London Electric Supply (No. 2) Bill.—On the motion for private business in the House of Commons on Monday night, the Chairman of Ways and Means on the London Electric Supply Bill said:—

After carefully considering the nature and scope of the powers which are sought in this Bill, I have informed the promoters that in my opinion the Bill is not one which the House ought, in the present Session, to be called upon to consider, raising, as it undoubtadly does important questions of a nublic character and in my opinion the Bill is not one which the House ought, in the present Session, to be called upon to consider, raising, as it indoubtedly does, important questions of a public character and contentious nature. The promoters have therefore agreed that the order for the Second Reading of the Bill shall be discharged and the Bill withdrawn. The question was put and agreed to.

Second Readings.—In the House of Commons on Tuesday, the Metropolitan District Railway Bill was read a second time, as was also Rhondda U.D.C. (Tramways Extensions, &c.) Bill.

In the House of Lords, the Mersey Railway Bill, the Yorkshire Electric Power Bill, and Ormskirk Gas and Electricity Bill were read a second time.

Standing Orders.—The Standing Orders Committee having con-

read a second time.

Standing Orders.—The Standing Orders Committee having considered the Aberdare U.D.O. Tramways Bill and the Stalybridge, Hyde, Moseley and Dukinfield Tramways and Electricity Board Bill, which were reported for non-compliance with Standing Orders, have decided that the Bills may be allowed to proceed. They have also allowed the Halifax Corporation Bill to proceed on condition that Tramways Nos. 4, 5, 6, 7 and 21 are struck out.

Petitiens.—In addition to the petitions deposited in the House of Commons, the following, amongst others, are lodged in respect of Bills emanating in the House of Lords:—Yorkshire Electric Power, 25 petitions including a number of local authorities and gas companies; Stalybridge, Hyde, Moseley and Dukinfield Tramways and Electricity Board 12 petitions, including the Lancashire Electric Power Co., Derbyshire and Cheshire County Councils, &c.; Aberdare U.D.C. Tramways by the Great Western and Taff Vale Bailway Co.; Ormskirk Gas and Electricity by the Lathom and Burscough U.D.C.

A Letter from the Front.—The Chairman of the Epsom Urban Council (Councillor O. Cropley) has received a letter from Mr. A. O. Gilling, the electrical engineer of Epsom, who is at the Front with the Westminsters. The letter reads:—"Life out here is not quite such a holiday as Egypt or India would have been, but I would not have missed the experience for worlds. We spend about four days and four nights in the first line and then beer, but I would not have missed the experience for worlds. We spend about four days and four nights in the first line, and then we go into the reserve for a few days. You would not recognise me if you saw me. We wear two pairs of socks, two pairs of putties, one ordinary uniform, a fur coat over all, and, lastly, inches of mud. I am writing this in what we call a 'bug-hutch.' It is a nice little hole dug in the ground, in which three of us live and aleep, and at the time of writing the enemy is taking pot shots at anyone who shows his head for a moment above the trench. One of our greatest amusements is considering how to device a new anyone who shows his head for a moment above the trench. One of our greatest amusements is considering how to devise a new way of cooking bully beef and making tea. Life is pretty strenuous. I have not had my boots or clothes off for three weeks, and I am getting quite used to sleeping on the ground—concrete floor. Our best fun is at night on guard. We wait for the flashes from the German rifles, and then fire back from where they come. The only unfortunate thing is, we don't know if we hit the mark." mark."

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industr also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—Last week the Middlesbrough Electricity Committee, according to a Yorkshire paper, consented to release the borough electrical engineer, Mr. H. M. TAYLOR, who intended offering his services to His Majesty's

The staff of the Stamford electricity works have presented a hall clock to MR. W. WELLS, meter inspector, on his marriage; the gift was handed to Mr. Wells by the resident manager of the Urban Electricity Supply Co., Lieut. F. H. Brandreth.

ME. WILLIAM MAWEY, a member of the staff of the Blackburn Corporation electricity department, was married at Blackpool on Monday to Miss Mary A. Frankland, of Blackpool. Mr. Mawby's colleagues at Blackburn have presented him with a mahogany timepiece.

We are glad to hear that Mr. C. CLARE ATCHISON, the Rochdale borough electrical engineer, who has undergone an operation, is

improving.

Mr. J. W. A. Devoy has resigned his position as mains super-intendent to the Tunbridge Wells Corporation electricity depart-

Tynemouth Corporation has been recommended to increase the salaries of the following officials in the electricity department as from April 1st next:—MR. C. TURNBULL, jun., electrical engineer, from £300 to £325 per annum; MR. J. WALLER, engineer, from £3 to £3 5s. per week; MR. H. T. WILKINS, chief clerk, from £2 to £2 5s. per week.

MR. A. J. SEWARD having resigned his appointment as constructional lighting superintendent at the West Ham electricity works, MR. J. TURTLE, the assistant, has been appointed to fill the vacancy at a salary of £156 per year, plus commission. The

works, Mr. J. Turtle, the assistant, has been appointed to fill the vacancy at a salary of £156 per year, plus commission. The Electricity Committee proposes to grant the following increases in the salaries of the undermentioned employés:—Mr. H. Irons, installation inspector, Mr. G. Hale, constructional assistant, Mr. W. Whitney, assistant mains engineer, from £215 to £240 per annum; Mr. J. C. Retzbach, assistant draughtsman.

Upon consideration of a recommendation by the Electricity and Transvar Committee of the Ringley District Council that the

Tramways Committee of the Bingley District Council that the salary of the electrical engineer should be increased by £20 per

salary of the electrical engineer should be increased by £20 per annum, the Council referred the matter back.

ME. J. B. PATTERSON, at present works superintendent at Lancaster electricity works, has been appointed assistant engineer while Lieut. G. C. Milner (engineer) is on active service at the Front. Councillor Heald (chairman of the Committee) said the appointment was well merited; and he complimented one of the works employés, Mr. W. Corless, on having returned to the Colours with five some with five sons.

Tramway Officials .- Mr. Charles Henry Hoggard, who has for 17 years been associated with the Sheffield tramways, has been appointed traffic superintendent of the Darlington

MR. R. L. MCCULLOCH, manager of the Warwick and Leamington Tramway and Lighting Co., has been appointed general manager of the City of Carlisle Electric Tramways.

MR. L. JOHNSON, manager of the tramways at Southampton,

has resigned.

The Tramways Committee of the Huddersfield Town Council have granted the following increases of salary:—MR. A. P. QUILLIAM, assistant tramway engineer, from £170 to £180; ME. T. HARTLEY, traffic superintendent, from £150 to £160.

General.—Mr. T. P. Brogan has been appointed chairman of the Battersea Electricity Committee for the ensuing three months.

MB. C. C. T. EASTGATE, M.I.E.E., has been appointed Electrical Inspector to the Government of the Punjab, and sails for India on the 6th prox.

Obituary.—Mr. R. H. CLAXTON.—It is with much regret that we have to record the death on the 18th inst. of Mr. ROBERT HEYWOOD CLAXTON, one of the most prominent pioneers of the telephone system in this country. Born in Liverpool in 1840, it was in Liverpool also that Mr. Claxton's telephonic activities commenced in 1879. In 1905 he retired from the position of provincial superintendent of the National Co.'s northtion of provincial superintendent of the National Co.'s northwestern province, and was elected to a local directorship, which position he continued to occupy until the taking over of the National Co.'s system by the Government at the end of 1911. It was in New Brighton, near Liverpool, that Mr. Claxton passed away. He was remarkable for a prompt recognition of the peculiarities of the Telephone Exchange business, and its combination of commercial and engineering problems. Though claiming no technical qualifications, he had exceptional judgment in the selection of his engineering advisers, the earliest of whom was Mr. Haworth, and amongst others we may recall the late Mr. Hope-Jones, Mr. France, and Mr. Gill, all of whom served under Mr. Claxton. It is perhaps for this reason that Liverpool was prompt to adopt new developments in the art. On Ostober 18th, 1834 (Electbical Review, Vol. XV, page 312), we recorded the introduction of the multiple switchboard at Liverpool, and the first use in the United Kingdom of dry core cable was made in Mr. Claxton's district in the Mersey Tunnel. He was the first to employ lady operators, and with such success He was the first to employ lady operators, and with such success as to lead to his assistance being sought to organise a similar staff in London. His relations with his subscribers and the local authorities were of the best, and in the competitive era Liverpool was immune from competition. With his colleagues and business friends he was always cordial and courteous, and regret at his death will be general and widespreed.

death will be general and widespread.

LANCE-CORPORAL J. A. DONALD.—We regret to learn of the death, at the age of 24 years, of Lance-Corporal J. A. Donald, of the Royal Naval Division (Engineers' Section), who died suddenly from myocarditis whilst on leave on Sunday last. He was for several years on the electricity works staff of the Blackpool Corporation, and we have it on the best authority that he gave promise of a very brilliant career. He was a most successful student at the Harris Institute. Preston, having taken the bronze medal at the Harris Institute, Preston, having taken the bronze medal and many certificates in electrical and mechanical engineering. He had also been a student of the Institution of Electrical Engineers since 1911. Lance-Corporal Donald, along with two other members of the Blackpool staff, joined the R.N.D. of the Institution of Electrical Engineers in September.

Mr. F. W. Farmer, —The death is appropried of Mr. Frederick

MB, F. W. FARMER.—The death is announced of Mr. Frederick William Farmer, for many years engineer at the Weymouth elec-

tricity works.

MR. J. W. PROCTOR.—The death has taken place, in his 55th year, of Mr. Jas. Wm. Proctor, of the firm of Jas. Proctor, Ltd.,

mechanical stoker makers, of Burnley.

MR. G MATTHEWS.—The sudden death is announced of Mr. George Matthews, for many years manager of the carriage depart-

ment of the Bristol Tramways and Carriage Co., Ltd. He was in his 73rd year.

ME WILLIAM LONG, of Thelwall Heys, Grappenhall, near Warrington, and Cleabarrow, Windermere, whose death is announced at the age of 80 years, was a director of the Windermere and District Electricity Supply Co., Ltd., and was first chairman of the

The death has cocurred, in his 36th year, of MB. MICHAEL TRAYNOR, of Bray, Co. Wicklow, chairman of the Urban District Council's Electric Lighting Committee.

NEW COMPANIES REGISTERED.

M-L. Magneto Syndicate, Ltd. (139.152).—This company was registered on January 28th, with a capital of £15,000 in £1 shares, to carry on the business of manufacturers of, and dealers in, apparatus, machinery, instruments and fittings used in connection with the generation, distribution, supply, accumulation and employment of electricity, general electrical engineers and electricians. The subscribers (with one share each) are:—D. H. Morris, 14, Waverley Road, Kenilworth, electrical engineer; G. A. Lister, D. H. Morris, 15, Coundon Road, Coventry, electrical engineer. Private company. The number of directors is not to be less than two or more than six; the first are C. A. Lister, D. K. Morris, G. A. Lister and E. A. Watson. So long as R. Lister & Co., Ltd., hold the majority of the shares, they may appoint two other directors; remuneration as fixed by the company. Registered office, Carlton Works, Lookhurst Lane, Coventry.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Foster Engineering Co., Ltd.—A memorandum of satisfaction to the extent of £4,000 on February 10th, 1915, of second debs., dated August 1st, 1918, securing £9,000. has been filed.

Wellingborough Electric Supply Co., Ltd.—Issue on February 12th, 1915, of £2,700 debs., part of a series of which particulars have ready been filed.

Sun Electrical Co., Ltd.—A memorandum of satisfaction to the extent of £375 on February 9th, 1915, of deb. stock dated March Sist, 1911, securing £7,000, has been filed.

Sheerness and District Electric Power and Traction Co., Ltd.—Issue on February 12th, 1915, of £1,000 6 per cent. second debs., part of a series of which particulars have already been filed.

Bombay Electric Supply and Tramways Co., Ltd.—Issue on January lat, 1915, of £10,000 debentures, part of a series of which particulars have already been filed.

Holophane, Ltd.—Capital, £200,000 in £1 shares (100,000 pref.) Return dated November 18th, 1914; 60,732 pref. and 92,485 ord. shares taken up; £15,207 paid; £137,960 considered as paid. Mortgages and charges, nil.

Mond Nickel Co., Ltd.—Particulars of £500,000 6 per cent. redeemable debenture stock, created November 17th, 1914, and secured by trust deed dated February 10th, 1915, filed pursuant to Sec. 93 (8) of the Companies (Consolidation) Act, 1998, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, except uncalled capital, subject to £375,000 1st mortgage deb. stock. Trustees: Rt. Hon. Earl of Selborne, K.G., G.C.M.G., and R. Arminage, M.P.

Costa Rica Electric Light and Traction Co., Ltd.—Capital, £130 000 in £1 shares. Return dated January 6th, 1915. All shares taken up. £7 paid. £129,993 considered as paid. Mortgages and charges: £226,650.

John Spencer, Ltd.—Capital. £75.000 in £5 shares (10.000 pref.)—Return dated December 8th, 1914. 10,000 pref. and 1,027 ord. shares saken up. £55,185 considered as paid. Mortgages and charges: £25,000.

Cordoba Light, Power and Traction Co., Ltd.—Capital, £1,000,000 in £1 shares (800,000 pret., 600,000 ord. and 100,000 unclassified). Mortgages and oharges: £894,000,

CITY NOTES.

Kensington and Knightsbridge Electric Lighting Co., Ltd.

DURING the year 1914 the number of houses and shops connected with the system increased by 124, from 4,817 to 4941, and the energy consuming devices, calculated as represented by lamps of 30 watts consumption, by 6,528 to 488,912 (14,600 kW.). The net profit available for dividend is £14,020, plus 62.555 beautiful forward.

by lamps of 30 watts consumption, by 6,328 to 488,912 (14,600 kw.). The net profit available for dividend is £14,020, plus £2,558 brought forward.

Deducting the interim dividends on the ordinary and preference shares, £7,575, there remains £9,004.

The second half-year's dividend on the first preference shares absorbs £1,500, and the dividend on the second preference shares from the 1st October to 31st December, £625. A dividend at the rate of 10 per cent, per annum for the lath-laff-year (£5,250) making 9 per cent, for the year on the ordinary shares is recommended, carrying forward £1,629. ordinary shares is recommended, carrying forward £1,629.

The renewal and reserve fund account has been increased by the transfer of £9,746, and now stands at £131,884, of which sum £93,454 is the amount expended in excess of capithe received, the balance being represented by working capital, investments, and cash balances. The directors announce the resignation of Mr. R. W. Wallace, K.C., who had been a director since the formation of the company. They have elected Mr. H. W. Miller, who has been associated with the company from its commencement, to the vacancy. Mr. Miller has been appointed managing director.

Annual meeting, March 4th.

Underground Electric Railways Co. of London.

THE report shows that for the year ended December, 1914, The report shows that for the year ended December, 1914, the net revenue from investments and properties (including general interest), after deducting general expenses, amounted £673,830. The service of the 4½ per cent. bonds of 1933, required £89,349, and of the 4½ three year secured notes from 30th April to 31st December, required £21,085, leaving a surplus of £563,396. Payment under the guarantee on Central London Railway Company Assented Stocks for the year absorbs £37,031; six per cent. per annum on £1,273,000 six per cent. first cum income debenture stock for the year, requires £76,380; six per cent. per annum plus income tax on sorbs £37,031; six per cent. per annum on £1,273,000 six per cent. first cum. income debenture stock for the year, requires £76,380; six per cent. per annum plus income tax on £0,380,050 six per cent. income bonds of 1948, for the year, absorbs £411,544, leaving £38,442. The income from investments and other sources amounted to £684,626, an increase of £54,809 or 8.70 per cent.

The passenger earnings of some of the companies have been adversely affected by the conditions prevailing in London since the commencement of the war, and there has been an increase in expenses due to increased wages and cost of

an increase in expenses due to increased wages and cost of material. As a result, the revenue from these companies is less than that for the corresponding period in the previous

Before the war begap the London Electric Railway and City and South London Railway Companies were well forward with their preparations for proceeding with the extensions and improvements involving large capital expenditure. As the conditions of the money market were then not favourable to capital issues by these companies, this company bought from them £463,000 and £412,000 of their respective debenture stocks, and issued £700,000 of its own £4 per cent. three-year notes secured on these debenture stocks. During the year this company acquired all the issued shares and debentures of the Metropolitan Steam Omnibus Co., Ltd., which subsequently sold its assets to the London General Omnibus Co., and was wound up. At the same time the Underground Co. sold to the L.G.O. Co. the assets which it had purchased in the previous year from the New Central Omnibus Co., Ltd., and this company has also been wound up.

The northern extension of the London Electric Railway, from Paddington to the Queen's Park Station of the London and North Western Railway, was opened for public traffic on January 11th, 1915, as far as Kilburn Park Station, and on February 11th, 1915, to Queen's Park station. The intermediate station at Maida Vale will not be opened until April rest next.

Additional omnibuses were added to the fleet of the L.G.O. Co. and new garages built in the early part of the year under review, but the total number of omnibuses in service and garages in use has been substantially reduced by the requirements of the War Office and Admiralty.

The Associated Equipment Company is making additions to its factory and equipment which will afford facilities for a much larger output.

The balance of £45,170 on revenue account on December 31st, 1913, has, in consequence of the changes in the constitution of the company, been applied in reduction of the item "Commission and discount of issue of bonds." The item of stocks and shares stands in the books at £14,520,892.

* Figures not available-Metropolitan District Railway, under Government control from August 4th, 1914.

Annual meeting, March 4th.

Metropolitan Railway Co.

The report submitted at yesterday's annual meeting, after referring to the Government control of the system since the war and the basis agreed upon with the companies, showed that the gross receipts in respect of the railway, etc., were £369,982, and the expenditure was £553,139, leaving £416,783, plus £181,503, miscellaneous receipts (net) from rents, interest, brought forward. Deducting interest, rentals and other fixed charges, and appropriation to renewals, £302,788, and dividends on preference stocks, £211,482, the balance available for dividend on ordinary stock is £92,274.

The dividend is £1 5s. for the year, with £11,458 carried forward, and £12,500 transferred to the general renewals fund. The dividends for 1913 was £1 12s. 6d. per cent., and £8,258 was carried forward. The dividend on the surplus lands stock is £2 15s. per cent., the same as for 1913.

Is £2 15s. per cent., the same as for 1913.

The electrical sub-station at Drayton Park has been completed, and the current for working the G.N. and City section has been supplied from the connany's generating station at Neasden since 24th September last with satisfactory results. In April last new stations were opened at Goldhawk Road and Uxbridge Road on the Hammersmith and City line, which have taken the place of the old Shepherd's Bush Station, now closed, Escalators have been put in at Baker Street Station at the joint expense of this company and the London Electric Company to improve the means of exchange between the Metropolitan and Bakerloo systems. Owing to the situation created by the war, defay has taken place in the commencement of the building of the hotel at Baker Street. The completion of the widening of the railway between Firchley Road and Wembley Park has been delayed mainly in consequence of the scarcity of labour arising out of the war, but it is expected that the section at present unfinished, namely, the viaduct at Kilburn, will be completed and brought into use in the course of the next few months.

The company is not promoting any Bill in the present session of Parliament. Having regard to the large amount standing to the debit of capital account, the directors availed themselves of a favourable opportunity to issue £500,000 £5 per cent. preference stock in December last. The stock is being paid for by instalments, and a substantial proportion has been pre-paid.

Four hundred and thirty of the employes of the company

Four hundred and thirty of the employes of the company have joined His Majesty's Forces, and many of them are now serving abroad.

Central London Railway Co.

Central London Railway Co.

Lord George Hamilton presided on February 18th at the annual meeting, held at the Westminster Palace Hotel. He said that owing to the war, the gross receipts were £10,146 less than in the previous year. The car mileage had decreased by 466,591 miles, or about 7 per cent. The passenger receipts per car mile were 9.390d., compared with 9.099d. for the corresponding period. The percentage of operating expenses to traffic receipts was 59.67, as compared with 58.47 for the preceding year. The balance available for dividends was £15,762, which was £16,716 less than for the corresponding period. This year they paid it per cent. less on the ordinary stock, and it per cent. less on the deferred ordinary stock, and it per cent. less on the deferred ordinary stock, and it per cent. less on the deferred ordinary stock. Even with those reductions in dividend the balance which they carried forward of £15,413 was £5,465 less than the balance of the preceding year. Looking, therefore, to the future, to the almost certain increased cost of coal, and the various other charges that might be put upon the company, they thought it undesirable to further reduce the balance, and he thought, considering the uncertainty which attended the future traffic of underground railways in London, the shareholders would agree in thinking that the directors exercised a judicious discretion in thus curtailing the dividend. They had also considered it expedient to postpone embarking in new contracts, and thus certain extensions and improvements, such as the widening of the tunnels at Holborn, and the installation of escalators at Shepherds Bush, Oxford Circus and the Bank, were postponed. The Wood Lane extension, which would connect the line with Ealing, had been advanced, but owing to the war the progress had not been very rapid. As regarded the future receipts and progress of the company he wished to speak with all caution. The property was in most excellent order, and the extension which would shortly be made to Ealing

Metropolitan District Railway Co.

Metropolitan District Railway Co.

Lord George Hamilton, G.C.S.I., presided, on February 18th, over the annual meeting. He said that in common with other railways they had felt the effects of the war. The Government had taken over the control of the railways from the outbreak of hostilities, and they arranged to pay the companies the net revenue which they obtained in 1913, subject to the condition that if such receipts in the first half of 1914 proved to be less than the amount received in the corresponding period of 1913, the compensation payable to the companies should be reduced proportionately. That principle had somewhat adversely affected those companies whose receipts in the first half of 1914 were higher than those in the corresponding period. They had a balance available for dividend on the second preference stock of £43,288. Upon that stock they last year paid a dividend of 2½ per cent. for the whole year. They came to the conclusion, after careful consideration, that this year it would not be desirable to pay more than a 2 per cent. dividend for the whole year. 1½ per cent. had been paid in the half year ending 30th June, 1914, and they proposed to pay ½ per cent. for the second half year and to carry forward a balance of £13,888. They could, out of the balance, have paid another ½ per cent. dividend, but they came to the conclusion—looking at the probable rise in the price of coal and other supplies—that it would be desirable to carry forward a good balance. As regarded capital expenditure, they deter-

mined to postpone all new contracts that were not absolutely necessary or in connection with which agreements had not been entered into. Certain of the stations had been materially improved: Charing Cross was now connected by escalators with two of the underground railways, and he was glad to say that the improvements there effected were thoroughly appreciated by the public, and were bringing them a substantial increase in receipts. Structural alterations had been made at Blackfriars Station, and the flying junction works at Earls Court had been completed and opened for traffic, and additional rolling stock had been delivered and placed in operation. The capital expenditure during the year had amounted to £117,399, the main items being £12,194 expended upon the flying junction at Earl's Court, and £77,215 on rolling stock. Estimated further capital expenditure amounted to £60,000, mined to postnone all new contracts that were not absolutely flying junction at Earl's Court, and £77,215 on rolling stock. Estimated further capital expenditure amounted to £60,000, of which £25,000 was required for miscellaneous items. Since the outbreak of war, a very considerable number of the officers and staff of all the companies who were working in connection with the Underground were summoned or enlisted for war service. He was proud to think that the Underground group supplied a large number of men in answer to this call. In reviewing the past year, there was one incident which gave special satisfaction to everybody connected with his railway. It was the honour of knighthood which was conferred upon their popular and competent managing director. Sir Albert Stanley's connection with the Metropolitan District had been one of continuous progress. He had the knack of making himself as popular with the employés under his control as with the general managers of other companies, and he thought it was universally felt that no more appropriate selection for distinction of the Sovereign could have been made from the high officials of railway management. His review of the incidents connected with this railway during the past year was cidents connected with this railway during the past year was necessarily bald and jejune, but he and the other directors had unabated confidence as regarded the future prosperity of its development might be slow there was every indication that it would be both certain and continuous.

Sir Charles Dalrymple, Bt., seconded the motion, and the

report was adopted.

London Electric Railway Co.

The annual meeting was held on February 18th at the Westminster Palace Hotel. Lord Farrer, who presided, said that the railway did not come under Government control, but during mobilization complete freedom of transport was given to soldiers and sailors. Having referred to the arrangements made to pay certain salaries to the officers and clerical staff engaged on war service, and congratulated Sir Albert Stanley on his knighthood, his lordship proceeded to refer to the progress of the various works sanctioned at previous meetings. The Charing Cross extension, opened in April, was familiar to all Londoners, and even with the abnormal conditions which had prevailed during the last six months, was showing good results. The Queen's Park extension, already under construction to link up the Charing Cross railway with Watford, was opened—as far as that company was concerned—last month, as part of their original scheme, and they hoped in normal times would develop a satisfactory traffic. These and other works were part of a well-considered plan for developing the traffic of London and could not be postponed. But on the outbreak of war the directors felt that no further expenditure should be undertaken on capital account for the moment, and outbreak of war the directors felt that no further expenditure should be undertaken on capital account for the moment, and therefore postponed the Hammersmith widening, the further arrangement of moving staircases, and the Euston and Camden Town extensions, which had not been begun; and they were enabled to effect some saving by the closing of one of the unnecessary surface stations at Euston, in October, which was very little used by the public. They could only hope that the situation would soon improve and allow them to proceed with the development of the undertaking. The total capital expenditure for the year was £399,997, and the estimate of further expenditure on capital account was £126,900. The estimated cost of works not yet commenced and in abevance was £1,204,400; these works comprised the extension from Golders mated cost of works not yet commenced and in abeyance was £1,204,400; these works comprised the extension from Golders Green, the Hammersmith and Camden Town extensions, and the installation of escalators at Trafalgar Square, Piccadilly Circus, and Tottenham Court Road stations. Turning to the revenue, the gross receipts had amounted to £712,573, being a decrease of £2,746, or .38 per cent. compared with the receipts for the corresponding period. The total expenditure had been £345,001, an increase of £12,145, or 3.65 per cent. Rates and taxes had increased by about £2,400, and it had cost the company £889 for watching and patrolling the line. National insurance had increased by £366. The percentage of operating expenses to gross receipts was 48.6, compared with 46.76 for the corresponding period. Train mileage showed a decrease, although an increase had taken place in the shunting miles caused by the opening of the Paddington extension. The average fare per passenger was 1 69d., as compared with 1.70d, for the corresponding period. The number of season ticket holders had increased. The directors were of opinion that when all the conditions which had prevailed since the outbreak of war were taken into account the results were not unsatisfactory.

Sir Algernon West, G.C.B., seconded the motion, which was carried.

was carried.

South Metropolitan Electric Light and Power Co., Ltd.

The revenue account for 1914 shows a credit balance of £43,054 plus £5,571 brought forward, making £48,625. After deducting £13,084 for interest on debenture stock paid and accrued, and for other interest, and £6,696 for interim dividends paid on the preference shares, there remains £28,845. Final dividend on the 7 per cent. cum. first pref. shares absorbs £5,004; final dividend on the 6 per cent. ditto absorbs £2,250; there is put to depreciation account £5,000; to credit of "issued expenses" £1,000; to reserve account £10,000, and £5,591 is carried forward. £5,591 is carried forward.

Year.	Lamps (85 watt).				Gross Consumers. Revenue.					xpendite	ıre.	Net Revenue.		
	•	Xonnecte	1. li	norease.								£		
1912		258,872		28,681		5,263	• • • •	56,604		22,670		33,933		
1913		289,705		30,833	,	5,888		65,635		24,065		41,570		
1914		330.982		41.277		6.468		66.792		23.737		43.054		

Notwithstanding the loss of revenue due to restricted lighting and the disturbance of the normal course of business by the war, the above table shows an increase under every heading except expenditure, which shows a decrease; and the net revenue is nearly £1,500 more than for 1913. In the circumstances, the directors consider this highly satisfactory. The sum which by the provisions of the debenture trust deed has to be set aside to special reserves before payment of any dividend on the ordinary shares, amounted during the past year to £15,374. The surplus profits after carrying £6,000 to depreciation and "issue expenses" accounts, but without making such other reserves, represent a dividend of 8 per cent. on the ordinary shares. The issue of 25,000 six per cent. cumulative second preference shares, made in March last, was over-subscribed, and during the year a further £5,630 four-and-a-half per cent. debenture stock has been allotted. The development of the West Kent Power Company is progressing satisfactorily. New business of a substantial character has been secured, and the prospects are very favourable.

or a substantial character has been secured, and the prospects are very favourable.

"Two Bills affecting your company's interests were presented to Parliament, one by the Loudon County Council, and the other by some of the London Electric Supply Companies. The former is not being proceeded with, and, as at present advised, your directors do not see their way to support the lutter." latter.

Annual meeting, March 1st.

County of Durham Electrical Power Distribution Co., Ltd.

Co., Ltd.

The report for 1914 states:—The total connections to the company's system at the end of the year amounted to 81,887 H.P., an increase of 11,392 H.P. The profit is £23,946 plus £1,111 brought forward. Interest on loans and debenture stock, £12,508, being deducted, the available balance is £12,540. The directors recommend a dividend of 4 per cent. for the year on the preference shares, £10,000. The question of depreciation is being considered in connection with a scheme of writing down the capital.

The expenditure on capital account during the year has been £34,285, of which £32,619 is the outlay on behalf of its associated company, the County of Durham Electric Power Supply Co. The profit for the year has suffered principally through the reduction in the dividend received from the County of Durham Electric Power Supply Co., which company's revenue has been adversely affected by the war. The offer sent out by the Newcastle company to each shareholder of the company of an exchange of shares on certain terms, has been accepted almost unanimously, only four shareholders, representing a nominal capital of £400, not having sent in their acceptances.

Charing Cross, West End and City Electricity Supply Co., Ltd.

In their report for 1914, the directors say that the result,

In their report for 1914, the directors say that the result, having regard to the exceptional circumstances brought about by the war, cannot be considered as unsatisfactory.

West End undertakings.—The gross earnings of these undertakings from sales of current, rent, etc., were £142,086, as compared with £151,240 for 1913. The expenses, excluding depreciation, were £69,677, as compared with £66,866 for 1913. The net earnings were £72,409, against £84,374. After including £18,000 brought from last year, paying interest on the debenture stock, and providing £22,000 for depreciation. £56,304 remains, out of which the preference dividend for the year absorbs £18,000, and the interim dividend for the half-year at the rate of 5 per cent. per annum on the ordinary shares, £10,000. A final dividend on the ordinary shares is recommended at the same rate, making 5 per cent. for the year. This requires £10,000, and after transferring to general reserve (income) account £304, £18,000 is carried forward.

The company has now connected to its city mains the total equivalent of 718,473 (30) waith lamps. The total includes 325,436 in lighting, 55,489 in heating, and 337,548 (13.574 n.r.) in motive power.

City undertaking.—The gross earnings of this undertaking from sales of current, rents, etc., were £153,689, as compared with £149,819 for 1913. The expenses were £86,983, against £80,639, and the net earnings were £66,706, against £69,180. Including £18,000 brought forward from 1913, paying interest on the depenture stock loans and advances there is a balance. on the debenture stock, loans and advances, there is a balance on net revenue account of £54,367, out of which has been paid the dividend on the preference shares amounting to £18,000, leaving £36,367, as compared with £38,327 for 1913.

The directors recommend that £18,367 be transferred to general reserve (income) account, and £18,000 carried formula.

Ward.

The company has now connected to its West End mains a total equivalent of 708,470 (30 watt) lamps. The total is made up as follows:—455,512 in lighting, 33,187 in heating, and 219,771 (8,338 H.P.) in motive power.

The Chief Engineer certifies that the plant and machinery at the several stations of the company have been maintained in a high state of efficiency. The company is associated with the Brompton and Kensington, Central, Chelsea, Kensington and Knightsbridge, London Electric, Metropolitan Electric, Notting Hill, St. James's and Pall Mall, and Westninster Companies, in promoting a Bifl, entitled "The London Electric Supply (No. 2) Bill."

Annual meeting, March 4th.

Compania de Electricidad de la Province de Buenos Aires, Ltd.

MR. S. F. MENDL (Chairman) presided on Friday at Winchester House, E.C., over the third annual meeting of the company. He said that the year under review would not come up to their expectations. They knew of the intense depression in the Argentine and in fact it might fairly be called the crisis, which arose towards the end of 1913, and had lasted without interviewed towards the end of 1913, and had lasted without interviewed towards the end of 1913, and had lasted. company. He said that the year under review would not come up to their expectations. They knew of the intense depression in the Argentine and in fact it might fairly be called the crisis, which arose towards the end of 1913, and had lasted without intermission ever since, and naturally, seriously affected a company of that kind. It was true that the provision of electric light and power had become a necessity in Argentina as in other civilised countries, but they were bound to be seriously affected when industrial, financial and commercial conditions in the country were as bad as they had been during the greater portion of the period with which they were dealing. Their revenue had increased by £6,454, which compared with last year's £13,541. They could not altogether complain that the proportionate increase had not been maintained. They had, however, succeeded in effecting radical economies in administration and general charges in Buenos Aires. These charges during the year were £12,500 as against £20,000 in 1912-13, and £21,000 in 1911-12. It must also be remembered that the company did not have the full benefit of the issue of the preference shares, as they were only issued in December, and were not fully-paid until March, 1914. The working expenses ratio shown at stations was 54.72 per cent. which was higher than they anticipated last year, and this was directly due to the depression in the country to which he had referred. If the proportionate increase in revenue had been maintained, and the development of the company had continued, the station working expenses ratio would have been automatically reduced to a much lower level. Another circumstance which had affected their expenses was the sale of the Pergamino station. That was a profitable sale in itself, as they got rid of one of their least satisfactory assets at the price at which it stood in their books, but it affected the expense ratio, as they had to work on a smaller gross undertaking. At the same time, the expense ratio of the new stations they ha factory than for some years. Inasmuch as Argentina produced what the rest of the world wanted, they might look with good hope to a speedy passing of the depression, and an electrical company should share in the return of prosperity. At the extraordinary meeting that followed there would be resolutions submitted for altering the articles of association, and for increasing the capital of the company to £1,350,000 by the creation of 12,500 ordinary shares of £4 each. The alteration of the articles simply provided for a reduction in the remuneration of the directors. There had been some letters of protest from shareholders as to the increase of capital, but his explanation would, he thought, be satisfactory. Under the agreement with the bankers who guaranteed the preference issue their commission was to be paid in ordinary shares ence issue their commission was to be paid in ordinary shares instead of cash which was a great advantage to the company. instead of cash which was a great advantage to the company. As the Board were considering a drastic reduction in the ordinary capital of the company it was necessary that this commission should be paid now, and hence the increase in the capital. If they left the matter over until after the capital of the company was reduced, then the bankers would be able to claim 12,500 ordinary shares of £4 each, which would probably give them the larger proportion of the capital. By issuing the new shares now the bankers would share in the proposed reduction.

GUY HANNAFORD seconded the motion, and it was

carried.

At the extraordinary meetings which followed, the resolu-tions outlined by the Chairman were agreed to.

Mersey Railway Co.

MR. JAMES FALCONER, M.P., presided on Friday over the annual meeting held at Worcester House, E.C. He said that during the latter half of the year the railway had been in the hands of the Government, although it had been worked by the company's staff as usual. The total net income for the year had amounted to £58,267, compared with £58,345 in 1913. The income available for distribution included £1,330, when the state of the propose account.

1913. The income available for distribution included £1,350, part of a suspense account which had been created from moneys received as compensation in connection with the purchase of certain plant of which delivery was delayed, that enabled them to pay all the debenture-holders' interest in full, except the "b" stock on which they were able to pay one per cent, against the 3 per cent, to which it was entitled. They were therefore able to do better for the debenture holders last year than they had ever done before.

The Chairman, in reply to questions, said that under their Act of 1900, they were empowered to set aside each year to the renewals fund, a sum not exceeding £3,000. For some time they had been setting aside £2,000 year by year, until last year they had accumulated £20,000. They had always had it in their mind, whenever the fund reached that figure, that they would not add £2,000 to it every year, but that each year should be considered on its merits. This year they had had exceptional repairs and improvements in connection with their stokers, and therefore, although they added £2,000 had had exceptional repairs and improvements in connection with their stokers, and therefore, although they added £2,000 to the fund, they took from it £934, the cost of renewing the stokers. As to the use of the line for its original purpose, there were proposals and Bills passed through Parliament by the Cheshire Lines Committee, authorising the construction of a connection between their station in Liverpool and the Cheshire Lines system, and there were also similar proposals with the Great Central Railway on the Birkenhead side. Had those proposals been carried out, undoubtedly, the railway would have proved a very important means of exchange of traffic on either side, but unfortunately, both schemes were dropped. The possibility, undoubtedly, was still there, and the great advantage to traders and the public was still there, but the enterprise of the other railways concerned was not so keen as it was at the time the Mersey railway was formed, and until that situation was altered, they could not do anything. At the present time particularly, financial matters were in such a condition that the raising of capital would not be considered by anybody.

The report was adopted.

Subsequently, a specula meeting was held at which a resolution was autreed to approxime of a Bill which the company is

The report was adopted.

Subsequently, a special meeting was held at which a resolution was agreed to approving of a Bill, which the company is promoting in Parliament for an extension for five years of the period during which the payment of interest on certain of the debenture stocks is contingent on the available net revenue of the company.

Sunderland District Electric Tramways, Ltd.

The directors report that for the year ended October 31st, The directors report that for the year ended October 31st, 1914, after providing for interest on the prior lien bonds and the first mortgage debentures, and for sinking fund instalment, and making provision for depreciation on investments, there remains a net profit of £2,179 plus £217 brought forward. The payment of interest at the rate of 2½ per cent. per annum (less income tax) on the first income bonds will absorb £1,752, leaving £644 to be carried forward. During the year the provision of suitable housing accommodation for the staff has been proceeded with, and eight houses in course of erection are now approaching completion. are now approaching completion.

The traffic receipts showed an increase up to the end of July

last of £2,246 over those for the corresponding period of the

previous year, but owing to the outbreak of war the receipts for the remaining three months of the financial year decreased

previous year, but owing to the outbreak of war the receipts for the remaining three months of the financial year decreased by £607, leaving a net increase of £1,579 for the year.

Mr. H. R. Hogg presided on Monday at the annual meeting, held at Balfour House, E.C. He said that during the past year the undertaking had progressed particularly well, and the receipts showed a healthy increase up to the date of the war. Immediately on the outbreak of hostilities the receipts fell and instead of showing a weekly increase on the previous year's earnings, turned what had been a net gain of 10 per cent. into a weekly reduction of about the same amount. That, however, occurred for only three months of the financial year, and the accounts, therefore, showed satisfactory features. The traffic receipts amounted to £29,966 which, with sundry additions, gave them a total income of £31,729. The working expenses, in spite of increased wages to the whole of the staff, were reduced from 61.19 per cent.—a very satisfactory reduction. The number of passengers carried was 4.719,579, an increase of 228,194. Last year they provided 15 new cars, and during that and the present year 18 older ones new cars, and during that and the present year 18 older ones had been completely renovated at a cost of £4,170; some badly wanted additional buildings had been completed, and the perorder at a cost of £1,983. They were, therefore, well prepared for the coming summer, when their lines were most fully employed. They had written off £2,343 for depreciation of rolling stock, buildings, etc., which the auditors considered sufficient. Like all who had funds invested in high-class securities, they had afferred from the full in prince and had therefore retained had suffered from the fall in prices, and had therefore retained a sum of £1,000 as a reserve to cover the difference between the cost of the investments and a valuation as at 27th July last. Semething like a third of the staff having joined the colours, they had had to employ and teach new men to take their places. The Board were proceeding with the erection of houses for the man, and their man, and their man. for the men, so as to have them near their work. They had provided for the manager, and had just completed eight cottages for the men, and as soon as they were filled they intended to start with some more, the land purchased having room for 22. That would accommodate about one-third of the total men

employed.

Mr. C. Eves seconded the motion, and the report was adopted.

Notting Hill Electric Lighting Co., Ltd.

SIR WM. CROOKES, presiding at the annual meeting held at Winchester House, E.C., on Tuesday, said that no new capital had been created for issue for several years. They had spent £4,128, principally, as usual, for mains, and secondly, for meters, to pick up new customers; the additional business would show a profitable return in the future. They had spent £42,768 in excess of the capital received, by employing their reserves in the business.

ploying their reserves in the business.

Considering the circumstances prevailing, the revenue account must be considered satisfactory, and it reflected credit on the whole of the staff. The expenses were nearly £300 below the previous year, and the profit worked out at £24,221 against £24,465. The revenue showed a reduction of £527, the greatly to the way regulations improved by the Covern against £24,465. The revenue showed a reduction of £527, due solely to the war regulations imposed by the Government, compelling consumers to reduce their lighting. Up to the end of September their revenue each quarter showed a nice increase, but the last quarter they knew was bound to be disappointing, and they estimated that the loss in net revenue was about £2,000. They were still suffering considerably, and obviously, they must continue to do so until the Government was able to remove the restriction as to lighting. Allowance had since been made in the account for the bonus to the staff, under their co-partnership scheme, which they Allowance had since been made in the account for the bonus to the staff, under their co-partnership scheme, which, they would remember, was based on the amount of profit available for dividend on the ordinary shares. The staff appreciated the concession, and would receive an addition of about 8 per cent. to their wages. By the depreciation, renewal and reserve fund account, it would be seen that the total reserve to be carried forward was £45,545, which in their opinion was a very satisfactory sum. They charged against the fund last year £605 for meters which were too old for further service, and with the metal filament lamps, it was more than ever necessary that meters should be in good order, otherwise they omitted to register when a very small quantity of current was passing. The Kensington and Notting Hill Joint Debenture Stock Sinking Fund continued to increase at a very even rate, and they had contributed £17,532 to it, but the total was £06,045. The balance was made up by the amount of the Kensington company's contribution, and further by the fund being invested at compound interest, which should result in the company having a valuable asset in 1931, when the stock was redeemed.

the stock was redeemed.

The Chairman referred to a table prepared, showing the progress of the company from its inception. The table showed that they added the equivalent of 12,258 lamps of 8 candle-power during the year, which was more than for many years past, and it was only the restricted lighting of London that had prevented the accounts from indicating a corresponding increase in revenue. In addition to their loss of revenue, he must say that, including men from the joint works, 15 had joined His Majesty's Forces, and were being paid part wages, which amounted to over £550 a year, but they felt the shareholders would approve this patriotic way of treating those

who were helping to win for them a glorious and lasting victory in this deplorable war. They had also been hit in another way by the war, as they had on order for Wood Lane a new generating set which was guaranteed to reduce the cost of production considerably, and should have been running by now. However, just as it was ready for delivery, the Government commandeered it for very important work of their own, and they would probably not get delivery of another set until the end of the year. The directors had referred in their report to the Bills which had been promoted this session on the London electric supply question. As had been explained, the Bill promoted by the L.C.C. did not receive the votes of a sufficient majority of the Council to approve it, and it had since been abandoned by the Council. The company, however, joined with nine other London electric lighting companies in promoting the London Electric Supply (No. 2) Bill, but the Government had just decided that this would not be allowed to proceed, as it came within the category of those Bills which were of a public character, and raised questions of a contentious nature. It had, therefore and raised questions of a contentious nature. It had, therefore, been agreed to withdraw the Bill. If it had passed the first House, the directors would have called the shareholders together to obtain their approval before proceeding with it, and he had intended to give them that day certain information

first House, the directors would have called the shareholders together to obtain their approval before proceeding with it, and he had intended to give them that day certain information respecting it, and also to inform the shareholders that during the time the Bills had been in preparation, the companies had been in negotiation with the L.C.C. with a view to formulating a scheme of sale acceptable to all parties. Recent developments rendered it uncertain as to what might be done in future in the direction of an agreement with the County Council, but he would assure the shareholders that the directors were carefully guarding their interests. The Chairman expressed their great regret at the loss they had sustained by the death of their colleague, Sir Joseph Swan.

Mr. A. E. Franklin, in seconding the motion, said the Chairman had asked him to say a few words with regard to the conference of the various electric light companies. They had heard that in the exceptional circumstances under which Parliament was meeting, the Bill would not proceed, but the shareholders might take it that the close association which had been existing during the whole of the negotiations would certainly have the effect of facilitating any future movement that might take place for the metropolitan in terests, which might come forward hereafter. The contentions matter raised in the Bill was of two classes, and probably it would not have amounted to much, had the Bill gone into the Committee Rooms. One matter really lay between the Borough Councils and the County Council, namelythat of their respective interests in the future of electricity. That was a matter which did not concern them. The other point was one of great public interest. There was a certain school of electrical companies who advocated the concentration of the production of electricity in one spot, and who followed the schemes instituted in America, where there was such concentration, and where, obviously, the working costs were much lower, because the output was much larger.

The retiring directors and auditors were re-elected, and, on the motion of Mr. Horace Boot, seconded by Mr. Davies, a hearty vote of thanks was passed to the Board and staff.

Newcastle and District Electric Lighting Co., Ltd.

Newcastle and District Electric Lighting Co., Ltd.

The directors report that during 1914, 19,271,853 units were sold, as against 16,863,440 in 1913, an increase of 14 per cent. The gross profit was £32,031 plus £10,076 brought forward. Deducting interest on debentures and loans, £16,620, and interim dividend paid last August, £4,193, the available balance is £21,294. A dividend at the rate of 3 per cent. per annum (less income tax) for the half-year ending December is to be paid (making, with the interim dividend, 3 per cent. for the year); this requires £4,044; transfer to second mortgage debenture redemption fund, £2,132; written off debenture issue expenses, £500; carry forward, £14.617. The directors have redeemed a further £2,060 of the company's 6 per cent. second mortgage debentures. Capital expenditure for plant and mains required to connect the systems of supply in Newcastle and Newburn has amounted to £31,274. The war has considerably affected the profits during the year chiefly owing to its causing delay in the completion and consequent erection of the new plant provided for by the third mortgage debentures. During the current year the company will for the first time get the benefit of this expenditure. Impending additions at the Close works, Newcastle, will involve certain capital expenditure, and shareholders will be asked to sanction an increase of borrowing powers by £50,000. Particulars will be given at the annual meeting on March 5th.

Capt. Frank Buddle Atkinson has been elected to a seat March 5th.

Capt. Frank Buddle Atkinson has been elected to a seat

on the Board.

Oxford Electric Co., Ltd.

THE revenue account for 1914 shows a profit (including £982 brought forward) of £14,917. After providing £2,091 for debenture and other interest, and writing off £770 on account of hire-purchase installations, the balance available is £12,055. A divipurchase installations, the balance available is £12,055. A dividend at the rate of 6½ per cent, per annum, less income tax, on the ordinary share capital (whereof 2½ per cent, was paid in September last) absorbs £6,500; five per cent, per annum on the preference shares, £2,500; there is placed to reserve and renewal of plant, £2,000, leaving to carry forward, £1,055. Reserve and renewal of plant account has been charged with the cost of plant replaced. The outbreak of war has adversely affected the costs of production and revenue charges, but the cost of plant replaced. The outbreak of war has adversely affected the costs of production and revenue charges, but notwithstanding the exceptionally unfavourable local conditions created, the sale of electricity has exceeded that of the preceding year. The supply mains of the company have been extended in Warneford Road, also in High (St. Thomas), St. Clement's and Leopold Streets.

Annual meeting, March 5th.

Scarborough Electric Supply ('o., Ltd.—The annual report states that during 1914 there has been connected to the company's mains the equivalent of 8,031 (30-watt) sumps, making a total to date of 130,903. The units supplied, including the 300,000 minimum supply to the tramw-ys; were 1,012,847. After placing £1,000 to depreciation account, there is a balance on revenue account of £3,847. The directors recommend that a dividend of 2 per cent for the year be paid, less income-tax, absorbing £2 000, leaving £1,847 to be carried forward. The carry forward is large, but the directors state that the exceptional existing circumstances make this desirable. The directors express their great regret at the loss sustained by the company through the death of Mr. John Hall, who had filled the office of secretary to the company since its formation in 1892. They place on record their appreciation of his faithful services. ciation of his faithful services,

Listowel, County Merry, Electric Lights Control of the annual meeting was held at Listowel, Mr. J. Macaulty presiding. Mr. E. L. Cantwell, manager and secretary of the company, showing that the gross profits for the Listowel, County Kerry, Electric Light Co., Ltd.presented the annual report, showing that the gross profits for the period were £295, plus £8 brought forward. There was placed to reserve £150, leaving available for dividend £154. It was resolved to declare a dividend of 7 per cent. for the period covered by the accounts, and to carry forward the surplus. The chairman said that they had reason to congratulate themselves on the very satisfactory position, and he referred to Mr. Cantwell's very capable conduct of the business. conduct of the business.

Companies Struck off the Register.—The following companies have been struck off the Register, and are accordingly,

British Engineering and Fume Condensers,
British Speedometer Control Co.
British Wireless Telegraph Syndicate,
Civil Engineering Press.
Electrical Fittings Co. (1911).
Electrical Amusements.
Electrocoustics.
Insulators.
Insulators.
Internal Combustion Engines Cooling Agent Co.
National Electric and Motor Corporation.
Patent Tube Covering and Lining Co.
Rotary Pulsating Plunger Pumps.
Smoke Abaters.

Aberdeen Suburban Tramways Co., Ltd.—The profit Aberdeen Suburban Tramways Co. Ltd.—The profit earned during the half-year ended January 31st, 1915, was \$1,153, making, with the sum brought forward from last half-year's accounts, a balance of \$2,445 at the credit of the profit and loss account. The directors report that they have been approached by the Corporation of Aberdeen with a view to the purchase by the Corporation of the company's undertaking. Negotiations are, meantime, pending, and if terms are proposed by the Corporation which the directors feel justified in submitting for the approval of the shareholders, a meeting with the shareholders will be called for the purpose of considering them. called for the purpose of considering them.

Jarrow and District Electric Traction Co., Ltd. The report for 1914 states that the total revenue amounted to \$7,870, an increase of £137 as compared with 1913. After deducting all expenses chargeable to revenue, including interest on debentures and loans, and making a provision of £800 for renewals, there remains, a surplus of £2,647, plus £1,028 brought forward. There is to be placed to reserve £900, dividend on the ordinary shares at the rate of 3½ per cent. for the year absorbs £1,748, and £1,026 is to be carried forward. Passengers carried: 1913, 1,531,434; 1914, 1,571,546. Receipts per passenger: 1913, 1194.; 1914, 1:18d.

Annual meeting March 1st.

Chelsea Electricity Supply Co., Ltd.—The directors recommend a dividend for the last half of 1914 at the rate of 6 per cent. per annum on the ordinary capital, making 5 per cent. for the year, after paying debenture interest and placing £14,320 to depreciation fund, £704 to debenture premium redemption fund, writing off £1.089 from the cost of extinction of founders' shares, and £1,4.9 off cost of investments; carrying forward about £3,196. The dividend is the same as for 1913.

Blackpool and Fleetwood Tramroad Co., Ltd.-Blackpool and Fleetwood Tramroad Co., Ltd.—The annual meeting was held on February 19th, at Manchester, Mr. John Greenwood presiding. The chairman said the available balance was down by £3,843 compared with 12 months ago. With regard to the future they were faced with a claim by the Urban District Council for a contribution towards the making of a new road. The road itself would be contiguous to the tramline, but it might as well be a mile away so far as it could benefit their own concern. Out of their staff of 125 men, 25 had joined the Forces of the Crown, two of their drivers, he was sorry to say, having been killed in action. The directors proposed to deal with the dependents who were left. He added that it was possible in the near future that they would have to expend a considerable sum on the relaying of the lines in Fleetwood. The report was adopted.

Compagnie Générale d'Electricité. — This French company, which has an ordinary share capital of £1,000,000 and a reserve fund of an equal amount, reports a very favourable increase in the turnover in 1914, and in particular the central stations at Amiens, Marseilles, and four other towns experienced a growth of almost 25 per cent. in the receipts. The net profits amounted to £148,000, and rose to £223,000 on the addition of the sum brought forward from 1913, this surplus comparing with £146,000 in the preceding year, when a dividend of 10 per cent., or £2 per share, was paid. The state of war, however, has induced the company to postpone for the present any distribution of profits for 1914.

Fife Tramway, Light and Power Co., Ltd.—The profits for the year (together with the balance carried forward), after paying loan interest and interest on debenture stock and providing instalment for debenture stock redemption, amount to £19,271. Out of this £4,205 was paid as interim dividend on the preference shares. The directors recommend a dividend on the preference shares for the half-year at the rate of 6 per cent. per annum, £5,998; 3½ per cent. dividend on the ordinary shares, £3,263; £3,000 to reserve stock, and £2,803 carried forward.—Financier. carried forward.—Financier.

County of London Electric Supply Co., Ltd.—The directors recommend payment of final dividends upon the preference shares at the rate of 6 per cent, per annum for the half-year to December 31st, less income-tax, and on the ordinary shares at the rate of 9 per cent. per annum, less income-tax, for the half-year to December 31st, making 7 per cent. for the year on the ordinary shares. £40,000 has been placed to reserve for depreci-ation, leaving £10,000 to carry forward.

W. T. Glover & Co., Ltd.—The directors recommend a dividend for the year ended December 31st, 1914, of 5 per cent. on the ordinary shares. After allocating £6,500 to debenture redemption funds, transferring £5,000 to reserve fund, and writing down certain quoted investments to their estimated values as at December 31st, 1914, a balance of nearly £8,000 remains to carry forward .- Financial Times.

Stock Exchange Notices. — Applications have been made to the Committee to allow the following to be quoted in the Official List:

Interborough Rapid Trausis Co.—85,000,000 additional first and refunding mortgage 5 per cent. gold bonds for \$1,000 each Nos. 93,659 to 98,658.

Waygood Otia, Ltd.—Further issue of 15,000 ordinary shares of £1 each, fully paid; and 15,000 6 per cent. cumulative preference shares of £1 each, fully paid.

Vulcan Boiler and General Insurance Co., Ltd. The net profit for 1914 is reported at £56,736 plus £9,320 brought forward. The dividend and bonus for the year amount to 25 per cent., £7,500 is placed to current risk and reserve fund, £1,200 to superannuation and benefit fund, and £10,481 is carried

Mirrlees Watson & Co., Ltd.—We read in a financial daily that the accounts for the year 1914 show a loss of £12,649, from which falls to be deducted the credit balance of £5,504 brought forward, leaving £7,145 at the debit of profit and loss account to be carried forward.

Tramways, Light and Power Co., Ltd.—The receipts for 1914, including £1,126 brought forward, amount to £29,174, and after providing for administration, loan and debenture interest, the profit amounts to £18,329. The directors propose (says a financial daily) to pay the dividend on the preference shares, and to carry forward £1,712.

London Electric Wire Co. and Smiths, Ltd.-According to the Financier the directors recommend a dividend of 7½ per cent. (7s. 6d. per share), less income-tax, on the ordinary shares for the last half of 1914, making 10 per cent. for the year, placing £40,000 to reserve (making £110,000) and carrying £25,952 forward.

Mexico Tramways Co.—It is stated that the directors are deferring the payment of the half-yearly coupon due on March 1st on the general consolidated first mortgage 50 year 5 per cent. gold bonds.

Bournemouth and Poole Electricity Supply Co., Ltd.—We are informed that the recent issue to shareholders of 2,500 cumulative 6 per cent. second preference shares was largely over-subscribed. Letters of allotinent were posted on 18th inst.

STOCKS AND SHARES.

THE tendency in Stock Exchange markets at the present time is disposed to heaviness. Everybody and everything seem to be waiting. The progress of the war is necessarily slow, and the main excitement lies in the Eastern sone of operations, where Russian and German armies drive each other backwards and forwards with a violence and over a length of country difficult to realise by us on this side. Every day one meets in the City, men home on leave from the French trenches who agree in their reports of the stale-mate character of the present fighting; and their personal experiences coincide with the official communiques to show that until weather conditions change, no great alteration is likely in the existing order of affairs.

The much-advertised blockade rouses little more than passing interest in the City-in illustration of which the financial eyewitness cites the steadiness of shipping securities. A theory that finds increasing support amongst the prophete is that Germany is deliberately endeavouring to array the world against her, in order that she may be able to excuse defeat by the declaration that she cannot fight the universe, although she could boast of her vaunted ability to beat the powers at present opposed to herwhich, by the way, would be at least a claim in perfect keeping with many of the other absurdities preferred by this ever-truthful nation.

The electric lighting companies are doing pretty well, having regard to the circumstances under which they have worked during the last five months of 1914 and the difficulties with which they are faced now. The London Electric Supply Corporation has actually increased its dividend, paying 4 per cent. against 3 per cent, a year ago, and so repeating a performance which it has not equalled since 1906. In 1907, the dividend dipped to 21 per cent.; in 1908 and 1913 it was 3 per cent.; in 1909 and 1910 the directors paid 2 per cent. The reserves now stand at £136,000; and the price of the shares has risen to 30s.

The Chelsea Company announces a dividend making 5 per cent. for 1914, the same as that for 1913. At 41 the yield on Chelseas comes to \$5 11s. ld. per cent. on the money.

The feature of the St. James's report is the small decrease in profits, considering war conditions. For 1913, 12 per cent. was distributed; but the current dividend of 10 per cent, is a repetition of the rate paid from 1906 to 1912 inclusive. Since the company was incorporated, the sum of £280,000 has been written off in depreciation. There is a capital reserve fund of £66,500,

and an emergency fund of £20,000.

The Notting Hill Company's net profit of £24,324 was the bagatelle of £141 less than that for 1913, and the 5s, dividend for the year maintains the rate paid since 1912. Its appropriations amount to £45,500, and the capital expenditure up to December 31st last came to £252.000.

came to \$253,000.

The South Metropolitan has paid no dividend on its ordinary capital since 1908, but its net profit for 1914 shows an improvement of £1,500. In addition to the usual £5,000 to depreciate the state of the stat account, twice that sum is carried to reserve, thereby doubling it

account, twice that sum is carried to reserve, thereby doubling it and bringing it up to £20,000.

Market changes on the week are unimportant. A fair line of Suth Londons changed hands on the basis of 3 to $3\frac{1}{16}$, and the exceptional bargain at 56s, marked at the end of last week was probably in respect of shares sold ex the dividend of 4s. County of London Preference are easier at 11. Metropolitan $3\frac{1}{2}$ per cent. Debenture stock advanced to 80, bringing it to a level with the similar security of the St. James' Company. The yield at this price is £4.7s. 6d. per cent. on the money invested.

The following tables show rises and falls on the week, in representative accounties.

Brazil Tractions have been fist, another fall of 21 points lowering Brazil Tractions have been flat, another fall of $2\frac{1}{2}$ points lowering them to $49\frac{1}{2}$. The market professes to be puzzled to account for the drop, and can only put forth the excuse—as lame as it is trite—of there being more sellers than buyers. Rio exchange is better to-day at $12\frac{1}{2}$ d., but Brazil Tractions continue to orumble. Singapore Electric trams weakened to 3s., on rumours that one of the native regiments had run amok, though the trouble is said to have been composed by now. This report is a variation of that which declared the town to have been bombarded by the Kronprinz Wilhelm. Adelaide Supply Preference improved to $5\frac{1}{18}$, but, on the other hand, Anglo-Argentine 1st Preference lost $\frac{1}{2}$. The Mexican issues are quiet.

Telegraph stocks and shares present a front rather less bold than they have lately displayed. The Eastern group is dull, Eastern Telegraph Ordinary being on offer at 127; probably a cheaper bid retegraph Ordinary being on oner at 127; proceeds a cheaper side would dislodge stock. The Anglo-American Telegraph division is also a little easier, and it is suggested that the would-be German blockade may have aroused some desire on the part of timid cable stock holders to realise their holdings. Personal experience, however, has failed to confirm this in any way. Great Northern are £1 better. Chili Telephones relapsed. Marconis are quiet and steady. There is not much doing in the market as a whole.

Henleys at 14 and Telegraph Constructions at 37 are both 10s, higher on the week. British Westinghouse issues are good, the Preference and 4 per cent. Desenture both showing rises. Electric Constructions again went back a trifle.

In the rubber market the principal feature is the steady strengthening of the market for the raw material. Rubber creeps up a farthing per lb. at a time, and holds on a steady upward course. The share market has scarcely responded to the firmness of that in the product. The snare market has scarcely responded to the armness of that in the product. Amongst armaments there is not much going on. A good deal of strength is shown by the popular descriptions—Vickers and Armstrongs more particularly. Certain of the iron companies are rather out of favour, and a little desultory selling from the North of England has led to reactions in some of the best-known shares.

Para Electric Railways and Lighting Co., Ltd.-The directors recommend a dividend of 6 per cent., less income-tax, on the ordinary shares for 1914, carrying forward £20,080.

EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING JANUARY, 1915.

THE returns of electrical exports and imports for the first month

of the year show a decided improvement in the case of the former, while the latter exhibit a considerable decrease in value.

Thus the exports from this country reached a total value of £364,562, as compared with £220,069 in December last, while the imports for January were valued at £239,127 as against £261,803, and the re-exports at £12,455 compare badly with the £25,510 recorded for December.

A glance at the export figures shows that while our output of

machinery and goods and apparatus has fallen off, this has been more than made up in improved business in other directions, principally in cable, telegraph and telephonic exports.

Machinery imports were somewhat heavier than in December, but a considerable falling off occurred in the importation of cables, telegraphic and telephonic apparatus and lamps. The feature of the imports is the great increase in U.S.A. business, which reached £198,596 in value during January, an increase of over £30,000 on December last. on December last.

Registered Exports of British and Irish Electrical Goods from the United Kingdom.

POLYPHASE COMMUTATOR MACHINES AND THEIR APPLICATION.

By N. SHUTTLEWORTH, M.Sc., A.M.I.E.E.

(Abstract of paper read before the Institution of Electrical Engineers at Birmingham, February 10th, 1915.)

(Concluded from page 245.)

The angle θ between the counter-voltage of rotation and the impressed voltage on the machine can only be obtained by proper adjustment of the phase of a field flux and exciting voltage. It is determined by the phase of the exciting voltage derived from the secondary (3) of the transformer, which as previously intimated may be regulated by a turning move-

It might be possible to employ a motor of the kind for fan driving where there is an opportunity of varying the power factor (namely, varying the angle θ) after each change in

load.

The one essential for successful operation and good character proportion with the load

The one essential for successful operation and good characteristics is that \$\theta\$ should vary in direct proportion with the load current. Under this condition the current would remain in phase with the voltage at unity power factor under all loads, and the speed would be appreciably constant.

Whether M. Latour embodies features such as this in the actual machine it is impossible to say, but from the success that he claims it would seem probable.

Whatever the methods employed by M. Latour, to obtain a successful motor on these principles, especially for a frequency as high as 50 cycles, it is quite certain that there is considerable auxiliary apparatus in addition to the motor itself, and this tends to make the equipment very costly. However, machines of this type are stated to be in commercial operation. For small sizes the speed range is considerable, and becomes greater the smaller the machine (50 per cent. above and below synchronism at 25-H.P., 50 cycles; 23 per cent. at 200-H.P.). For large sizes the speed range is very limited, and is not sufficient for the usual practical requirements.

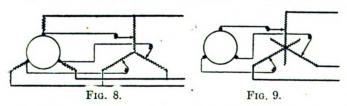

Another example of a variable-speed motor with shunt characteristics is the Eichberg 3-phase commutator motor, represented by fig. 8. The motor is simply an armature fitted with a compensating winding, and exciting voltages are impressed from the auxiliary auto-transformer, which is permanently connected in star to the supply system, and is provided with tappings, each of which may in turn be connected to the brushes of the motor. It will be observed that by varying the ratio of the two arms in each phase of the auto-transformer there is a different ratio between the armature and compensating-winding voltages on the motor, and this, as previously seen, implies variable armature speed. ing-winding voltages on the motor, and this, as previously seen,

mplies variable armature speed.

The very fact that the armature and compensating winding have an equal number of turns and are wound in opposite directions prevents energy being transferred from stator to rotor, or vice versa, by induction. An auto-transformer connected in parallel cannot therefore act as a power transformer, and it corpies only the mottless exciting a power transformer. and it carries only the wattless exciting current required by the motor. Speed regulation by the means described is a com-

paratively simple matter.

Unfortunately, if good operation is to be maintained, this simple motor cannot be constructed with a sufficiently large number of turns in the armature to suit normal supply voltages. It is quite imperative in practical machines that the number of armature turns be considerably reduced. This being so, the auto-transformer at once becomes a power trans-

former, and delivers a portion of the total input of the motor direct to its armature at comparatively low voltage and heavy current. The effect of the change is considerably to increase the capacity of the transformer, and it entails also a massive controller to deal with the heavy currents between the transformer, and it entails also a massive controller to deal with the heavy currents between the transformer.

controller to deal with the heavy currents between the transformer and the brush-gear.

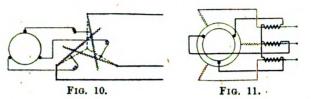

The necessity for a transformer, however, vanishes when the stator and rotor turns are no longer equal, as it becomes possible for power to pass from stator to rotor by induction, and the functions of a transformer may be embodied directly in the motor in addition to its previous duties. The modified machine is shown in fig. 9, where it will be seen that the existence of a field in the motor is made positive by closing the star point of the stator winding, and tappings are brought out from it to which the brush stude of the armature are connected by means of the controller.

The latest type is represented by fig. 10; the star point of the stator winding in this case is closed through a polygon, and the intention is evidently to impress on the armature a voltage which is slightly dephased from the true star voltage of the supply system. A phase displacement of this nature brings about an improvement in the power factor.

To be strictly accurate the angle of the phase shift must vary with each speed, but as this is impracticable the improved power factor is obtained at a few speeds only. The stator winding is continued and is provided with tappings below the star point so that speed regulation may be obtained below synchronous speed as well as above.

The possible speed variation with this type of motor approximates to that given for the Lature motor, but the output limits

mates to that given for the Latour motor, but the output limits are considerably smaller. No proper provision can be made

for commutation, which is effected solely by the resistance of the brush contact. It is very doubtful if a 200-H.P. machine could be built at all, except for very low speeds.

Altogether, the machine is very expensive and requires a large controller, and it is very unlikely that this type will be able to meet competition either in quality or in price.

The alternating-current series commutator motor is destined to play a not inconsiderable part in practice. In construction the stator is exactly similar to that of an ordinary induction motor; the armature is similar to that of an ordinary induction motor; the armature is similar to that of a continuous-current motor. It is now usual, instead of connecting the stator winding directly in series with the armature, to introduce a transformer which reduces the voltage impressed on the armature; this is necessary to improve the commutating conditions, but it incidentally isolates the armature and commutator from the supply system, and therefore allows the stator winding to be designed suitable for a high-tension system.

The characteristics of this motor are much more comprehen-

The characteristics of this motor are much more comprehensive and varied than that of the continuous-current series motor. An A.C. series motor can exert any required torque over a considerable speed range, and this is rendered possible by the simple movement of the brushes round the commutator relative to the stator. At any one brush position the speed-torque characteristic resembles that of a continuous-current motor in many respects; over the working speed range an increase of torque is accompanied by a decrease in speed, and vice versa. At starting and at low speeds the current in a continuous-current motor is limited only by its internal resistance, whereas in an alternating-current motor it is limited by ance, whereas in an alternating-current motor it is limited by fluxes which produce an inductive drop. The alternating-current motor possesses the advantage that without series resistrent motor possesses the advantage that without series resistance it may possess a high starting torque and also give high running torque at top speed; any starting torque from the very lowest value to several times full-load torque may be obtained by merely shifting the brushes. With the brushes is such a position as to obtain low starting torque the standstill current is very small, hence it immediately becomes evident that under such conditions the machine may be connected directly to the supply system without the introduction of any starting devices. Any initial torque such as is required to start the load may be obtained by moving the brushes from the position of rest, and, in general, full-load torque is exerted with half full-load current, and other torques in proportion. The motor is quite unsuited for maintaining a constant speed under a variable load torque, unless the changes are very gradual and allow of a change in the brush position in the meantime, but for loads with torques which remain practically constant at all speeds, or torques which vary only with the speed, the motor is eminently suited.

constant at all speeds, or torques which vary only with the speed, the motor is eminently suited.

Centrifugal pumps, blowers, and ventilating fans, and also reciprocating pumps and Roots blowers may be cited as examples. The torque varies approximately as the square of the speed in the first three drives, and for the others is practically constant over a wide range of speed. In the former cases the series commutator motor is capable of producing speed variation from standstill to the maximum value in a perfectly smooth and gradual manner. Instead of the inherent torque of the motor commencing to fall immediately the armature has started from rest, it gradually rises to a certain maximum which is slightly higher than the starting torque; then it begins to fall away in the usual manner as the speed increases further, until the torque falls to a value equal to that required by the load.

by the load.

Generally speaking, a speed range of 3:1 under constant torque is the utmost limit for a series commutator motor. For all supply pressures above 200 volts it becomes necessary to interpose a transformer between the stator and rotor so as to reduce the armature voltage, but the capacity of the transformer is a fraction only of the capacity of the motor, and does not therefore add very seriously to the cost. Fig. 11 shows diagrammatically the arrangement which is employed.

Other applications to which his motor may be put are the driving of calendering machines and calico printing-presses. To a certain extent series motors are used for cranes and hoists, but as those required are usually of small capacity, these services are better provided for by the single-phase commutator

The motor has an advantage over the ordinary induction motor in being able to operate at unity power factor at full

load and full speed; at low speeds under the same torque the power factor is slightly reduced, but still remains high; at lower speeds and torques the power factor falls off rapidly due to the great reduction in load, but it does not become worse than that of an induction motor of equal power at the same input.

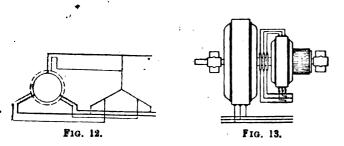

Machines for low frequencies such as 25 cycles per second are easier to build, and may be made in slightly larger sizes than 50-cycle motors; the size of the commutator is almost proportional to the frequency, so that high-frequency motors are slightly more expensive. The upper limit of capacity of 50-cycle motors is in the neighbourhood of 100 H.P., and of 25-cycle motors 150 H.P.

The simplicity of construction of the series commutator

25-cycle motors 150 H.P.

The simplicity of construction of the series commutator motor, the ease with which starting and speed regulation are effected, the high efficiency at all speeds, and the good power factor over a wide range, are properties which are likely to make it of great service in many applications.

Another important application of the polyphase commutator motor is that of cascade connection with an induction motor.

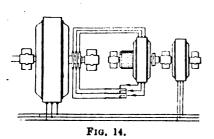

The machine may be either of the shunt or series type, but, unlike those previously discussed, must be capable of working satisfactorily over a wide range of frequency.

A commutator machine is the only one in which a gradual change in frequency does not necessitate a change in speed, and this is sufficient to explain its use in this connection.

and this is sufficient to explain its use in this connection.

A shunt commutator motor suitable for cascade connection embodies a compensating winding in series with the armature, and a separate shunt exciting winding in series with the armature, and a separate shunt exciting winding which derives its excitation from the source of supply, preferably through an autotransformer, so that the excitation may be varied at will and the phase of the voltage fixed in relation to that impressed on the motor terminals. A diagrammatic representation is shown

For any one ratio of the exciting voltage to the terminal voltage there is one frequency only at which the machine will operate. This frequency may be altered conveniently by varying the ratio of the exciting voltage to the terminal voltage, and whatever the terminal voltage these relations hold good. By connecting such a machine in cascade with an induction motor, the slip-ring voltage as determined by the design of the motor is taken up by the shunt commutator motor, and the latter enforces a slip frequency only, according to the setting of its excitation. It will be evident that it becomes possible of its excitation. It will be evident that it becomes possible with an arrangement of this kind by varying the excitation of the commutator motor to impose a wide range of frequencies on the external circuit, which is the secondary of the induction motor, and, as previously shown, each frequency corresponds to a definite speed of the induction motor. Speed regulation

becomes, therefore, almost as simple as with continuous-current machines.

The commutator motor has to deal with the full secondary current, and a voltage which is fixed by the maximum slip frequency employed; a cascade motor, therefore, capable of producing x per cent. slip in the main induction motor must be designed for x per cent. of the latter's ratings.

Two methods of utilising the torque exerted by the commutator motor are in practical use. One suggested by Krämer is to couple the shaft of the commutator motor direct to that of the main motor, or to drive the auxiliary by a belt or gearing. This combination is illustrated in fig. 13.

The other method is due to Dr. Scherbius. The commutator motor is direct coupled to a squirrel-cage induction generator. The commutator motor has to deal with the full secondary

ing. This combination is illustrated in fig. 13.

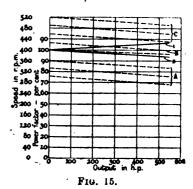

The other method is due to Dr. Scherbius. The commutator motor is direct coupled to a squirrel-cage induction generator, which in turn is electrically connected to the supply system. Electrical energy given to the commutator motor at variable frequency is converted to mechanical work available on the shaft, and this is re-converted to electrical energy in the induction generator, and returned to the supply system. This arrangement allows a convenient speed to be adopted, which

is practically constant under all conditions. It is illustrated in fig. 14.

By suitable design the main motor may be magnetized altogether by the commutator motor, and no wattless current will be taken from the supply system even on no load; or the main motor may be made to draw leading wattless current on all loads in a similar manner to a synchronous motor.

The power-factor characteristic curve, 1 in fig. 15, is typical of those obtained at many speeds during tests on a 500-H.P. 440-volt 40-cycle 12-pole induction motor, in conjunction with a shunt-excited commutator motor manufactured by the British Thomson-Houston Company. A few speed characteristics (Curves A) also bear out the conclusion arrived at from theoretical considerations

The possibility of further improvement along these lines has been proved by following the suggestions of Milch. He pro-

posed to employ the commutator motor as a commutator generator, and to run the induction motor above synchronous speed as well as below.

speed as well as below.

In order to pass the synchronous point it is necessary to obtain exciting current of proper frequency and phase from a source of constant magnitude, and independent of the actual value of the frequency. This may be suitably accomplished by the use of a small frequency converter.

This converter exciter, positively driven from the main motor, is connected to the field winding of the shunt commutator machine, and the voltage impressed naturally sets up a current in the armature of the commutator machine and the rotor of the main motor, the phase being such as to produce a rotor of the main motor, the phase being such as to produce a

rotor of the main motor, the phase being such as to produce a torque and cause the machine to accelerate in speed.

The speed of the induction motor remains appreciably constant under load, and the characteristic obtained on test is shown in fig. 15, Curve B.

As it is unnecessary to continue separate excitation when there is a voltage present at the terminals of the commutator generator, it is replaced by self-excitation, the exciting winding being connected to its exciting transformer. Regulation of the speed of the main motor is carried on from this point by adjustment of the excitation of the commutator machine exactly as in the case for speeds below synchronism.

The arrangement of the B.T.H.-Milch system is shown in fig. 16.

fig. 16.
Under load the commutator generator maintains practically constant frequency, any variation which takes place being due to the internal losses, and as is to be expected the speed of the

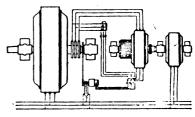

FIG. 16.

main motor drops slightly with load. Speed characteristics obtained during the same tests as the foregoing are shown in Curves C of fig. 15. The power factor of the main motor for all these speed characteristics is shown in curve 2 of the same

The type of motor with a control system as described is only in small units it is much of practical service for large outputs. In small units it is much too expensive, but for large powers it becomes cheaper than a continuous-current motor and apparatus converting from alter-

continuous-current motor and apparatus converting from alternating current to continuous current.

The limit of slip frequency is approximately 15 cycles per second, so that except for 25- and 40-cycle supply systems the amount of speed regulation is perhaps not so wide as would be desirable for some applications, and this may limit its possible field to some extent. Its use lies principally for unidirectional rolling-mill drives, and for this purpose it is admirably adapted. The speed characteristics shown in Curves A, B, and C of fig. 15 may be made to droop to any desired extent as load is applied by the simple superposition of series excitation on the shunt excitation of the commutator machine. A con-

siderable drop of speed between no load and full load is usually necessary for rolling-mill service in order to utilise energy stored in the flywheel.

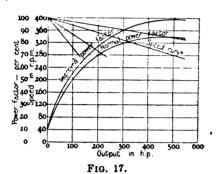

The variability in the power factor of a brush-shifting series commutator motor precludes it from successful use in cascade with an induction motor. The machine which will be discussed has fixed brush position, and if run at constant speed has a fixed power factor under all loads and frequencies. Furthermore, the system of control has been made as simple as brush shifting.

The commutator machine must generate a voltage strictly proportional to the current passing through it and also at

proportional to the current passing through it and also at some predetermined phase angle to the current; this is accomplished by series excitation.

plished by series excitation.

The commutator machine in part acts like a resistance, producing a slip proportional to the load. There are two essential differences between this and a resistance speed-regulation; one is that the energy input to the commutator machine, represented by the voltage at its terminals and the current passing through it, is converted to mechanical work, which may be utilised as desired, and secondly the current is not in phase with the voltage, which means that a wattless component is present. Naturally this component is used to advantage by making it of such a strength as to act as magnetizing current for the main motor, and thus to improve its power factor. In

its simple form the series commutator motor, or slip regulator

as it is termed, is a combined phase advancer and slip producer, the slip being proportional to the load.

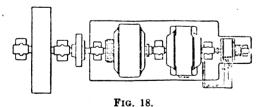

To extend its sphere of usefulness it is desirable to be able to adjust the slip-producing properties so that any required slip for a given load may be obtained, and at the same time to retain the phase-advancer properties under all conditions.

For this purpose the states of the computators rooter is

For this purpose the stator of the commutator motor is fitted with a special 3-phase winding placed with a certain angular space relation to the armature with fixed brushes and

connected in series therewith.

By a suitable arrangement of shunt to the stator winding By a suitable arrangement of shunt to the stator winding or parts of it, a portion of the total current may be deviated from the stator, the shunted current bearing a fixed angle to the total current. It becomes possible by this means to vary the excitation, and therefore the flux and voltage of the commutator machine through any desired amount for any current. The shunt possesses principally reactance, and has a limited resistance; accordingly it takes a solenoid form with an iron core, and its variability is produced by movement of the latter. This simple operation, which is the only regulation necessary, causes the commutator machine to take up a wide necessary, causes the commutator machine to take up a wide

range of characteristics. The limits are approximately those of the shunt commutator motor, the maximum slip frequency being approximately 15 cycles per second; with a 50-cycle induction motor this allows a slip of 30 per cent. between no load and maximum load.

The characteristics shown in fig. 17 were obtained in the testing department of the British Thomson-Houston Company. The improved power factor at light load is not quite so good as can be obtained with a pure phase advancer, because saturation in the commutator machine cannot be allowed, but the improvement at full load, which really matters so far as the generating plant is concerned, is very considerable; the power factor also remains independent of the amount of speed regula-

The slip regulator possesses a fairly large field of application. The slip regulator possesses a fairly large field of application. There are in existence at the present time a large number of induction motors which are controlled by resistance in the secondary circuit. In particular is this the case with motors driving rolling mills, and with flywheel motor-generator sets. The losses involved are often of considerable magnitude, and would represent a large saving if recoverable, but hitherto this has not been possible. The slip regulator converts not only 90

per cent. of the energy previously wasted into useful work, but at the same time improves the power factor of the induc-

The application to a flywheel motor-generator set is represented by fig. 18. The commutator motor is mounted on the end of the shaft after the manner of an exciter, and its terminals are connected directly to the slip-rings of the main induction motor. As load comes on the motor the secondary current flows through the commutator motor the secondary induction motor. As load comes on the motor the secondary current flows through the commutator motor, causing it to generate a counter electro-motive force of rotation which simultaneously causes the induction motor to slip. The electrical energy passing into the commutator motor is converted to mechanical form and given to the shaft of the set, thus serving a useful purpose; the amount of slip between no load and full load may be adjusted by simply moving the core of the solenoids which shunt the stator winding.

Another service is the regulation of an induction motor driving a ventilating fan, the torque of which is definite at each speed.

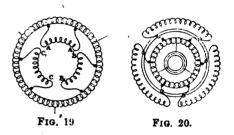

This type of equipment may be built for any extent.

cach speed.

This type of equipment may be built for any output.

The Schrage type of motor combines an induction motor and cascade-connected shunt commutator motor in one.

Assume that the 3-phase primary winding of an induction motor is closed on itself, as would be the case in a continuous winding of the lap type; the tappings at which voltage would be impressed are 120° apart. The secondary winding on the

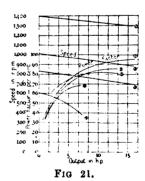

rotor is shown as three separate phases by AA1, BB1, CC1 in fig. 19.

It has already been shown that to maintain a rotor speed It has already been shown that to maintain a rotor speed lower than synchronism, there must be a counter electromotive force supplied to the rotor phases of the same frequency and opposite in sense to the voltage induced in them by the slip of the rotor relative to the primary field. There is a very simple and effective method of accomplishing this without an auxiliary machine, as will be clear from the following:—

Let a stationary commutator be fitted to the stator winding, the junctions of the coils being connected to the segments. Any pair of brushes pressing on the commutator will have a voltage

the junctions of the coils being connected to the segments. Any pair of brushes pressing on the commutator will have a voltage between them the value of which depends on the angular separation or spacing. The frequency of the voltage depends on the speed of rotation of the main field relative to the brushes, and if the latter are stationary it will be the full primary frequency. If the brushes rotate with the same spacing in the same direction in space as the main field, the

frequency obtained will be smaller, but the voltage will remain constant. Obviously then if the brushes are fixed relative to the rotor, and rotate with it, there will always be the same frequency between them as is induced in the rotor phases, and the voltage may be varied at will according to the spacing. By ensuring that the voltage obtained in this manner between the pair of brushes is opposite in sense to that induced in one of the rotor phases by rocking the brushes bodily relative to the rotor and so altering the phase, the desired counter voltage

for each phase is obtained.

When the brushes of each pair are moved together so as to orincide there is no voltage between them, hence there can be no speed regulation, but incidentally the rotor phases are short-circuited, and the machine may therefore run as a simple induction motor with short-circuited secondary. Separating induction motor with short-circular secondary. Separating the brushes produces a voltage and sets up a current which forces down the speed of the rotor until it is opposed by the slip voltage induced in the rotor. For each angle of separation of the brushes there is a definite speed. The machine has the ability to take load with very slight speed drop in precisely the same manner as an induction motor. A load torque retards the rotor, and the increased voltage induced exceeding the

counter voltage between the brushes sets up a secondary cur-

rent which provides the necessary torque.

It will be observed that the secondary current flows in the same sense as the rotor voltage; the rotor is therefore giving up energy by conduction to the primary, to which there will be occasion to refer again. Reversing the position of the brushes is a natural extension of the operation; and the results produced are of fundamental importance. The voltage present brushes is a natural extension of the operation; and the results produced are of fundamental importance. The voltage present between a pair of brushes is fixed by primary considerations, and is unalterable and uninfluenced by secondary voltages. By reversing the position of the brushes, and therefore reversing the sense of the voltage between them, the secondary voltage in the rotor phase is compelled to follow suit, and this necessitates that the rotor commence to rotate at a speed higher than synchronism. Under these conditions the torque-producing current in the secondary is in the same sense as the primary voltage derived from the brushes. Energy is therefore conducted from the primary to the secondary and converted to mechanical work.

It will be observed that the functions of the primary wind-

It will be observed that the functions of the primary ing are two-fold; first it induces voltage and transfers energy through the medium of the main field to the secondary, after induction motor: secondly, it acts It will be observed that the functions of the primary wind-

ereted to mechanical work.

It will be observed that the functions of the primary winding are two-fold; first it induces voltage and transfers energy through the medium of the main field to the secondary, after the manner of an ordinary induction motor; secondly, it acts as an auto-transformer and frequency transformer, and thus transforms and returns power (which is delivered to it by the secondary) to the system when the motor runs below synchronous speed, and transforms and conducts additional power to the secondary when the motor runs above synchronous speed. The power dealt with by the commutator and through the brushes is only due to the slip energy analogous to the power dealt with by a separate auxiliary shunt commutator motor.

To sum up the action, it may be said that the power induced in the secondary on the induction-motor principle corresponds to the mechanical output at synchronous speed under the torque considered, and if the speed be less than synchronous the secondary power is in excess of that used up in the mechanical form, and the difference is conducted back to the primary, where it is transformed and returned to the system. At speeds above synchronism the power induced in the secondary is less than the mechanical output, and the deficiency is made good by power conducted directly from the primary to the secondary. The electrical input therefore corresponds to the mechanical output, and the machine is highly efficient at all speeds.

The amount of speed regulation above and below synchronism is limited only by the power factor of the secondary circuit. This must be kept high, otherwise the torque for a given current will suffer. The power factor depends solely on the ratio of resistance to reactance; and the reactance is low so long as the frequency is low. On a 50-cycle circuit a slip frequency of 25 cycles above and below synchronism gives speed limits in the ratio of 50+25: 50-25, namely 3 to 1, and for circuits with a lower frequency than 50 cycles per second the speed range is increase

The characteristics shown in fig. 21 are reproduced from the E.T.Z., four speed curves being given from the many obtainable within the complete speed range. The machine is essentially one which gives an output proportional to the speed, as may be readily deduced from its action above and below synthesis. chronism.

The motor is specially suited for driving machine tools, pumps, fans, blowers, paper-making machinery, and printing presses.

Discussion.

Dr. G. Kapp said the author had earned the thanks of the Institution for having brought a subject before it which had been neglected too long. To persons conversant with vector diagrams those given by the author were quite intelligible; and if they were dealing with asynchronous machinery no more would be required, for they had grown accustomed to read into the vector diagram the physical meanings represented by the different lines and angles. This physical meaning was however not so obvious in the diagrams representing commutator machines; he had found it useful for the understanding of treatises on commutator machinery to supple-

ment the ordinary vector, or time, diagram by what was known as a space diagram. The distinction was that in a time diagram the vectors retained their lengths, but altered their positions, whilst in the space diagram the vectors retained their angular positions but altered their signs and lengths. The conventions he suggested were as follows, assuning all machines to be of the two-pole form:—

Sense of progression in the winding.—Stator and rotor are supposed to be wound in such way that a current passing in at one end and out at the other terminal (or brush) will produce a flux across the diameter in the same sense. In other words the exit terminal becomes a N pole. The flux produced is represented by a line parallel to the diameter of the winding. The length of the line represents the creat value of the flux. The direction of the flux is represented by an open arrow head. A little circle is to be placed at the other end of the line to show that it is a flux vector. The angular position of each flux vector does not vary, but where two or more fluxes are combined the angular position of the resultant flux vector changes. In other words the resultant flux vector rotates also in a space diagram.

Sense of rotation.—The time vectors rotate counter-clockwise. To make the resultant flux vector also rotate counter-clockwise in the space diagram the marking of the stator poles must be in a clockwise sequence.

Direction of EMF.—The direction of the EMF, induced in the

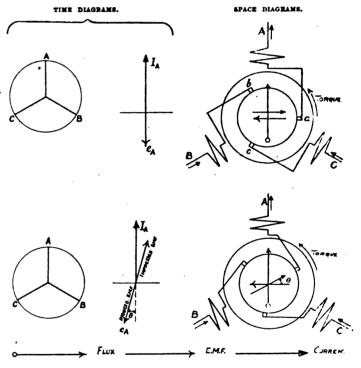

poles must be in a clockwise sequence.

Direction of EMF.—The direction of the EMF. induced in the rotor is obtained by revolving the flux vector through 90 degrees. The EMF, vector is represented by a line with open arrow head.

Current vector.—This is represented by a line with a closed arrow head. Its direction is given by the terminal diameter, its length and sign (whether to one side or the opposite side)

are read off the time diagram.

Direction of torque.—Consider the current vector as a lever, pivoted at its tail and weighted at its head with the field flux, then the direction in which the lever turns is the direction in which the lever turns is the direction. tion in which torque is exerted.

The application of these conventional rules is shown in the figures. The motor is supposed to be provided with a compensating winding so that no flux is produced by the armature current and the only flux vector appearing in the space diagram on the right is that due to the stator coils A B C. The figure on the left shows the phase position. It is chosen for the moment that the current in A has positive crest value. The direction of current in the space diagram is shown by the arrows placed to the field coils A B C and the resultant flux is shown across the armature by the vertical flux arrow. The brushes are placed at right angles to the coil axes and the resultant current through the armature is represented by the horizontal vector passing across the flux vector at right angles. This produces torque as shown by the curred arrow. The motion resulting from this torque produces the induced EMF, the space vector of which is also drawn at right angles across the flux vector, but with the arrow head on the left. Since an arrow head on the right of the current vector means a positive value (the current having positive crest value at the time) the space vector of the EMF, must be considered to be negative and in the time diagram the EMF, vector must be drawn in line with the current vector, but in the opposite direction. There is thus obtained for the A phase the very simple time diagram shown to the left of the space diagram. It consists of the current vector 1A and the vector of induced EMF, eA in exact opposition; which is the condition for the working of the machine as a motor. To supply the motor with current we must impress an EMF.

which has one component equal but opposite to eA; further a co-phasal component to cover losses and finally a component leading by 90 degrees to balance EMF. of self-induction. A motor with the brushes exactly at right angles to the respective field axes can therefore not work with unity power factor.

factor. Assuming the brushes to be shifted forward by an angle θ as shown in the lower figure, the flux and EMF. vectors remain in the space diagram as they were, for these quantities depend on the position of the stator coils and these have not been altered. The only thing that has been altered is the direction of the current vector. It crosses the flux line ϵ t an angle which is by θ smaller than the previous right angle. There is this phase difference between current and induced EMF., and that is shown in the time diagram by the two vectors being no longer in line but enclosing the angle 180 θ . The torque has been decreased in the ratio of 1 to cos θ , but a leading component eA sin has now been introduced and The torque has been decreased in the ratio of 1 to $\cos \theta$, but a leading component eA sin has now been introduced and can be made to balance the EMF. of self-induction. The latter depends on the current and is independent of the speed; the leading component eA sin θ depends on strength of flux (therefore current) brush position and speed. It will thus be seen that only above a certain speed and load can the motor work with unity power factor and that by suitable choice of load, brush angle and speed the machine, whilst taking power from the line, can at the same time inject a leading current into the line so as to make up for the bad power factor of some other motor connected to the same line. If the brush angle be increased to 90 degrees that power. It then acts in the same way as a static condenser.

torque vanishes and the machine must be driven by external power. It then acts in the same way as a static condenser.

Dr. M. L. Kahn, whilst agreeing that the Latour motor might not be quite so good as some later machines, said that it was nevertheless a much better machine than the author stated. The first patent ever taken out on this type of machine was applied for in this country by one named Wilson, and consequently the machine was an English invention.

Wilson, and consequently the machine was an English invention.

Mr. W. J. Larke stated that the commutator difficulty was not the bogey that people imagined. The ordinary objection was inherited from experiences with D.C. machines and not experienced in practice with A.C. commutator machines. He also emphasized the advantages obtained from slip regulation.

Dr. A. H. Railing remarked on the commercial advantages of three-phase commutator machines, and pointed out that when this type of machine reached a higher state of perfection the competition from the D.C. machines would disappear.

[On p. 245, through an accident whilst in the press, figs. 3 and 4 were inverted both in order and in position.—Eds.]

WORKERS' EARNINGS AND THE WAR.

By "COMMERCIAL."

If any proof were needed, the recent debate in the House of Commons indicated plainly that since the war began the prices of the necessaries of life have gone up considerably. As to the question of the temporary or permanent nature of such increases, for at any rate the period of the war, we are invited to wait and see. One can only trust that the waiting part of the arrangement will not be unduly prolonged, if only for the calls of the unfortunate unon when higherings each port the sake of the unfortunates upon whom high prices act most harshly, and that the seeing part of it will be as satisfactory as may be. We have had some experience of the consequences as may be. We have had some experience of the consequences attendant upon a shortage of coal. From the industrial point of view dear coal, or no coal at all, may mean a measure of equal disaster. For domestic supplies it is indispensable to some, and nearly so to most people, but the approach of warmer weather will, if nothing else does, perhaps tend to lower prices. Food is, however, quite a different proposition, and we await with much interest the further investigation and discussion of this question, and the resultant Government action or inaction in the matter. We do know certainly that prices reached an artificial figure at the coming of the war, and people who were foolish enough, paid in some cases fancy prices for such an article as flour. Amid the confused array of arguments brought forward at the present time, bearing upon the increased cost of food, one cannot be dogmatic either in one direction or the other. It may be well to ponder rather on the question that concerns our power to buy food at the on the question or the other. It may be well to ponder rather on the question that concerns our power to buy food at the present prices. Will our wages, or salaries as workers, be able to stand the strain if present conditions remain, or perhaps grow worse? There are one or two indications about of some more or less ill-defined unrest, and, with no desire to be pessimistic, the evils of dear food might well cause such unrest to manifest itself in a most serious manner. In certain quarters industry booms, and work is better than has ever been known. The trades so affected are too well known to reiterate known. The trades so affected are too well known to reiterate here, but labourers draw the wages of skilled artisans, and the latter twice the amount of their usual earnings, if not the latter twice the amount of their usual earnings, if not more. Electrical firms are sharing in this happy state of plentiful orders, doing day and night and Sunday work. Government orders are largely responsible for this, but the absence of the usual German supplies is another factor in the situation. Orders are pouring into this country from the neutral European nations, which cannot in some instances be filled for some time. It is not merely that Norway or Holland is ordering more than in other years. They are ordering material which is rarely, or never, in the normal run, obtained from anywhere save Germany. Deyond this, as can be seen from the pages of the ELECTRICAL REVIEW, the Colonies are doing their snare, and signs are not wanting that they will maintain it after the war.

Outside the ranks of those firms who are thus fully employed there seems to be no serious slackness, and the absence of the hundreds of thousands of Kitchener's soldiers has doubtless relieved the labour market, where such slackness may have occurred. In some places, notably at our great ports, labour is very scarce, and presumably is worth more money to-day than usual. All this is to the good, but so far it only concerns those who are paid by the piece or the hour. Salaried workers are not having such a satisfactory time in some cases. In the first case certain firms took steps, immediately upon the outbreak of war, to reduce their staff wages. The reduc-tions so made varied upon a sliding scale arrangement from 10 tions so made varied upon a siding scale arrangement from to per cent. for the lowest, to 33½ per cent. for the highest paid of their employés. We make no remark upon the advisability or justice of such an arrangement, but merely mention the fact. These employés are now under the necessity of paying more for the maintenance of themselves and their dependents, if they have any upon a seriously lessened income. It is not fact. These employes are now under the necessity of paying more for the maintenance of themselves and their dependents, if they have any, upon a seriously lessened income. It is not difficult to imagine the consequences of a 20 per cent. less income having to face a 25 per cent. rise in the cost of life's necessaries. At the best, salaries in the electrical world are, for several excellent reasons, generally no better than in other spheres of industrial activity, and in some departments of electrical work, to judge from certain evidence, they are occasionally worse. Some there are who predict that a slump will follow in the wake of the war. That is at least possible, if not probable. Now that slump will be the rainy day towards which the present boom ought to contribute something in the shape of a reserve. If, therefore, prices are to keep up their tendency, the staff wage should go up now. The worker receiving double money can pay 25 per cent. more for food and still save something, but the salaried man at a fixed, or reduced, rate is, as the Americans say, up against it. He has to accept the rush and overtime, which are at least partly occasioned by the needs of his country's Government for war materials; he has to pay the extra prices which prevail, but he has nothing extra as a set-off or recompense for either of these. The welfare of the staff workers is at least of equal importance to that of the other workmen, and yet just at the present the present the prevent the parent the prevent the parent th importance to that of the other workmen, and yet just at the moment this seems to be accorded less recognition than it might receive.

might receive.
As outlined above, this is the position of affairs with regard to the pay of the various workers at the moment. Generally speaking, the situation may be said to be quite as good as might have been anticipated under the abnormal circumstances which have prevailed since August last. Things are undoubtedly looking better for electrical people generally than they were twelve months ago. Further than that we cannot go, and the only course possible for a month or two seems to be to adopt the waiting and seeing arrangement to which reference has already been made.

has already been made.

CORRESPONDENCE.

Letters received by us after 5 PM. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Modern Wiring.

May I correct a reference on page 267 of your current issue? It is in the abstract of my paper on wiring and was due to the omission of a line in my typewritten copy. The sentence refers to the new system of concentrated cab-tire cable and should read as follows:—

"On a concentric conductor having a core of 3/22 S.W.G. and an external conductor of 36/30 S.W.G., the insulation reand an external conductor of 50/50 S.W.G., the insulation resistance between the two wires was 1,700 megohms per mile, and the insulation resistance between the external wire and earth was 52 megohms per mile. This latter was the insulation resistance given by the impregnated tape plus the cab-tire sheathing." sheathing.

As mentioned in my paper the cab-tire is not designed to give high insulation. Its good points are that it maintains well its initial degree of insulation. It gives, by its dampresisting quality, more permanent value to any supplementary insulation beneath it; and it is a most excellent chemical protection to the whole cable. It is the latter qualities alone that are emphased by the makers of the cable. Yet, considered as a conduit, it has the inestimable advantage that no rush of current or even harmful leakage to earth can occur throughout its length. It is for these reasons that in its concentric form, it may be recommended, in combination with proofed tape or other light insulation beneath it, for use where the external conductor thus protected is normally at approximately earth potential. These conditions obtain where the external conductor is connected to the earthed mid-wire of a three-wire supply. Even in a two-wire system one side may be often usefully permitted to remain with only a moderate degree of insulation and difference from earth

potential. In such a case the cab-tire sheathing with its underlying reinforcement suffices to reduce stray currents to negligible dimensions.

Donald Smeaton Munro.

Edinburgh, February 20th, 1915.

[That there was an omission was obvious in the proofs, when going to press, but having no means of remedying it, we printed the matter exactly as received.—Eds. Elec. Rev.]

A.C. and D.C. for Lighting.

I must thank Mr. Fewler for the detailed manner in which he has replied to the points raised in my letter of recent date.

I am afraid that Mr. Fowler has misunderstood me in several cases, as shown for instance, by his remarks with regard to three-phase and direct current distribution boxes. For a given number of points, whatever the system of supply adopted, I cannot see that, allowing one fuse per point, the number of fuses, and hence, presumably the size of the box, will vary

number of fuses, and hence, presumably the size of the pox, will vary.

Again, it is surely not often that a three-phase distribution panel is used for lighting circuits? Is it not the best way to use a three-pole main switch with three single phase double-wound transformers, if the size of the installation warrants the use of more than single-phase distribution?

I regret that the wording of my letter with regard to "earth return" also conveyed a wrong impression—granted an earthed return, electrolytic action due to leakage current is still more likely to occur on D.C. than on A.C. circuits.

Mr. Fowler has overlooked the word "branch" when reading my remarks with regard to cables. By branch cables, I intended to imply the cables leading out of the distribution box, and not the main cables. It is usual to place the transformer close to the distribution box, in order to take care of this point.

of this point.

I still maintain that Mr. Fowler is mistaken in his remarks I still maintain that Mr. Fowler is mistaken in his remarks about the diameter of the filament in wire lamps. If he will follow out the reasoning as follows, he will, I am sure, agree with me that his statement was made in error. The total candle-power given out by any lamp is the product of the "intrinsic brilliancy" and the area of the filament. Assuming that the diameter of the wire remains constant, the length of wire for a given candle-power, at a standard intrinsic brilliancy, must be a fixed value.

As the low-voltage lamp must obviously have a lower resistance than the high voltage lamp, the above conditions are not fulfilled as, in order to give the standard intrinsic brilliancy for a reduced voltage, either the length of wire must be decreased, or the diameter increased. The first alternative gives a lower total candle-power, the second (within certain limits) giving the correct result.

Perhaps Mr. Fowler has been told that the diameter of say a "40-watt" filament for a 250 volts supply is the same as for a 220 volts supply. This is, I believe correct, but it does not extend to such a wide range as that mentioned by Mr. Fowler.

Mr. Fowler.

In conclusion, I would like to say that my remarks were primarily concerned with indoor lighting, and not with "temporary work," and that by "general handiness," I endeavoured to express my opinion that A.C. supply was more adaptable than D.C. to varying conditions and requirements as they occur in lighting practice.

C. A. Hall.

Monkseaton, February 18th, 1915.

High and Low Voltage Metal-Filament Lamps.

Referring to the letter of Mr. Henry Fowler, electrician-incharge, Liverpool, in your issue of the 12th February, in reference to A.C. versus D.C. for lighting, it seems very strange that a man who occupies a position of electrician-in-charge should be led into making such mistaken statements as he does on the question of the filament diameters of high and low volt lamps. He appears to be doubtful whether there is any difference between the filament diameter of a 110-volt lamp and that of a 2000-volt lamp of a 220-volt lamp.

It would seem as if the simple application of the well-known electrical laws of resistance would indicate to him at once that the filament of a given candle-power lamp in 220 volts must be considerably smaller—a proportion of about one-half of the diameter of the same candle-power lamp in 110 volts. He ought to further understand that candle-power is not a matter of thickness of filament, but a matter of filament surface for any given material and temperature (or efficiency) at which it

Nela.

Consulting "Engineers."

In reply to "Delta," I should prefer a consulting "engineer" who knows he knows nothing, shuts his mouth, and leaves himself in the hands of a few good firms, to one who apparently has never heard of apparatus which has been in general use for many years, and which is actually installed in his jobs (directly after the term of maintenance is passed) by the man who does not want commission so much as rest at night. at night.

We still have installed 20 voltmeters in parallel on the same

bus bar, lead-covered cables behind switchboards, and net-works which are linked up solid, switches on every lamp-post and distributors on one side only of busy streets, insufficient and badly arranged plant and no provision for extension, together with all the little drawbacks so well known and inseparable from the standard specification made to suit every

How many consulting "engineers" could run and manage the jobs which they cause to be installed?

The fact of the matter is that no mar should be allowed to practise as a consulting engineer unless he has passed through the proper training and quite stiff examinations, and the parasites referred to above would then be got rid of.

Alpha.

Half-Watt Lamp Fittings.

We were very interested in the article on Half-Watt Lamp Fittings by "Research" in your issue for February 12th. The question of the proper use of half-watt lamps is a very im-portant one. The publication of the article referred to should portant one. The publication of the article referred to should be very useful to users of these lamps. We have had instances be very useful to users of these lamps. We have had instances brought to our attention where the use of half-watt lamps in badly designed fittings has resulted in cracking the globes of the fitting and general unsatisfactory working. It must be appreciated that the very best results can only be obtained from half-watt lamps if they are properly installed in well ventilated fittings. It is not sufficient to put them into any type of lantern, the only ventilation of which is a hole in the bottom of the glass globe. The heat from the half-watt lamps necessitates considerably more efficient ventilation than this, and lamp users are urged to select only fittings made by those manufacturers who have a full appreciation of the necessities of the case

manufacturers who have a full appreciation of the case

"Research" is correct when he states that probably the best results obtained with half-watt lamps are obtainable with the indirect lighting system. This company's indirect lighting fittings have been used in a number of cases, and the resultant illumination is wonderfully agreeable, attractive and effective. In the last paragraph of the article your contributor mentions the need for an adjustable lamp-holder. It may interest him and your readers to know that such an adjustable lamp-holder for half-watt lamps is illustrated and described in our price list of weatherproof fittings, etc., for half-watt lamps.

London, E.C., February 16th, 1915.

Trouble with Oil.

A 1,000-kw. set, D.C., driven by a Belliss & Morcom engine, is giving considerable trouble throwing oil. An oil baffle is fitted on the tail bearing, making a tight job so that no oil can possibly get through the commutating end of the machine, and while the shaft is quite dry, oil is found in considerable quantities inside the commutator, and thrown up through the armature windings. The conclusion come to is that the oil is carried in in the form of vapour from the engine, and condensed inside the machine. Have any of your readers had trouble of this sort? and what steps have been taken to get over it?

Electrical Patents owned by Alien Enemies.

In the list under the above heading on page 271 of your issue of to-day's date, I notice that patent No. 18786 of H. Bremer, Neheim/Rhine, electric lamps, is included. This patent is not owned by an alien enemy but the British Westinghouse Electric and Manufacturing Co., Ltd., of this address, having been assigned to them in the year 1906.

It is somewhat astonishing to find such a glaring error in a list of this nature as the patent in question is one of some notoriety, having been the subject of two actions of infringement in which the British Westinghouse Company were the successful plaintiffs. These actions attracted at the time a considerable amount of attention in the electrical world.

The Westinghouse Patent Bureau

(A. S. CACHEMAILLE, Joint Manager.)

London, W.C., February 19th, 1915.

In the list of British patents originally owned by residents in enemy countries which appeared in your issue of 19th February, we inadvertently omitted to point out that subsequent assignments, recorded or otherwise, of the patent rights may have been effected, and that the official register should be consulted.

should be consulted.

Mr. A. S. Cachemaille, C.P.A., informs us that the patent of Bremer No. 18786 of 1902 has been assigned to Messrs. The British Westinghouse Electric and Manufacturing Co., Ltd., and requests us to make this known, which we have much pleasure in doing.

W. P. Thompson & Co.

London, W.C., February 22nd, 1915.

A Quarter-Turn Coupling.

In your issue of February 19th of the ELECTRICAL REVIEW, on page 248 you describe a quarter-turn rod coupling "invented" by a Chicago engineer to replace a noisy bevel gear drive on a pump.

It may interest you to know that there is in the engineering department of the University of Leeds a small model of this coupling. This model was there when I entered the University over five years ago, and consequently the arrangement can not be considered new. Arthur Rawling.

London, E., February 20th, 1915.

Salaries of Junior Engineers.

In reply to "Driver" regarding the salaries and knowledge of some of these engineers, it is simply preposterous that a great number of these wasters, who, as "Driver" says, know nothing, get the chief post. I entirely agree with all that "Driver" says, by my own experience, which is long and varied. For instance, a year ago I went to a place where there were two large suction gas engines and electrical plant on varied. For instance, a year ago I went to a place where there were two large suction gas engines, and electrical plant on an elaborate system. At this place the engineer in charge happened to be no more than a common labourer. The whole installation had to be remodelled. I never saw such a state of affairs; everything had been abused to the utmost; in fact, it was in such a state that I refused to do the repairs till experts had seen it. The firm came that put it down, next came two more good men, and the architect, and they all agreed with me that the man was not efficient, yet the firm who put the plant down, supplied this "chief engineer," at a good salary. I was asked to put the whole thing into good working order, which took five months. The job had only been put down two years, yet it ran into hundreds of pounds to repair the damage done by an incompetent engineer, or shall I say a novice? I hope I never have another job like it; the damage done, if I were to describe it, would fill a small book. After the job was finished I left it to the satisfaction of all parties concerned, and I believe that the "engineer" had the order to quit, and time too. I myself was pushed out of a job to let the waster in.

Old Reader.

In reply to your correspondent "Driver," might one inquire how many years ago the cases he quotes took place? For we all know central stations were in a very slack condition 15 years ago. Also we may presume from "Driver's" description of the station, that the engineer-in-charge was receiving the magnificent salary of 25s. per week, and had probably come straight from a technical college, so the officials who engaged him, undoubtedly deserved the results, and then "Driver" asks: what kind of engineers-in-charge do you call these? "Duds," and we frankly admit it, for they lack experience; but there are "duds" in all grades of the station from the volt boy to the chief, including "drivers." I quite agree with "Driver" when he says that all these troubles could have been prevented if they had had an experienced engineer, but can you expect an experienced engineer for the paltry salaries we see advertised in the Electrical Review's situation vacant columns for engineers-in-charge? Last, but not least, I really cannot imagine the average driver, or stoker, working out indicator diagrams, CO, and water recorder charts, boiler and coal tests, etc., or even the volt boy's daily load curve; they are usually more efficient at calculating the correct weight for a mile habicap or how much there is to come from a "tenror" cash recorder and coal tests, the correct weight for a mile habicap or even the voit boy's daily load curve; they are usually more efficient at calculating the correct weight for a mile handicap or how much there is to come from a "tanner" each way on a six to four on chance. Not that I wish to cast a slur on drivers or stokers, for I have always found them very good men at their jobs, so if you have got on in the world, "Driver," my advice is, don't let your brains run away with your pen. Honi soit qui mal y pense.

### THE EDUCATION OF THE ENGINEERING WORKER.

Our own columns, as well as those of contemporaries and the proceedings of scientific societies, testify to the perennial interest which is excited by the subject of the training of engineers. The kindred topic, that of training for the industrial side of engineering, has not hitherto received the same amount of attention.

There are several reasons for this. Possibly the one which is most responsible is that those who consider the subject, and express views upon it, are themselves engineers, and not artisans. This is very likely a subconscious reason, but it is certainly true that many men first begin to think on the subject after this style : - " How could I have been better trained to do the work I have been called upon to do since I left college? What course would I adopt if I had to do it all over again, knowing what I now know of the conditions obtaining in real business?" Then the man who went to college first thinks he might have learnt discipline and application if he had only had a year in the works first; on the other hand, the man who went to the works first thinks he would have known a great deal more of the working of machines, of the nature of processes, and of what goes on generally in the shops, if he had had some technical training first.

A paper read before the Manchester Local Section of the Institution of Electrical Engineers, on Tuesday, February 23rd, by Mr. A. P. M. Fleming, represents, we believe, the first attempt to bring this matter before our Institution as a body. We give elsewhere an abstract of this paper, which, ably compiled and presented to the meeting in an attractive manner, evoked an interesting and, we

think, an important discussion. Two further possible reasons for the neglect of the subject of the training of those who will work at the bench all their lives were brought out in the discussion: one, that there are so many more to deal with, and they have, as a general rule, less money and less time available for spending upon their education; the other, that undoubtedly skilled direction is the first essential, because it can frequently get good results even out of imperfectly-trained

men, though not at the highest rate of efficiency. Like everyone else who has handled the problem, Mr. Fleming finds that boys leave school in a very incompletely educated state. The necessity for imparting general instruction, as outlined in his paper, and as revealed in the apprenticeship rules of large firms of engineers and shipbuilders, and railway companies, should not exist. only of recent years that teaching, or to use the inharmonious title which has been bestowed upon it by those in authority, pedagogy, has itself become a subject of University rank. We believe that elementary subjects, or, as Mr. Peck would say, fundamental principles, are nowadays put before children in a far more attractive manner than was formerly the case. Children of school age are at the most impressionable period of their lives, and they can, and do, remember those things which attract their interest and appeal to their imagination.

The use of the scientific imagination may lead us into strange errors at times, but it is only by its aid that we are redeemed from being unable to see the wood for the trees. The imagination must be cultivated, and in this connection we may refer our readers to a recent issue of the General Electric Review, containing an article describing the apprentice system at the works of the General Electric Co. of America, at West Lynn, Massachusetts. The demands of theory upon the imagination are found to be best brought

Digitized by Google

home to the mind of the young man by concrete representation of the different truths which are taught him.

The absence of proper co-ordination between employers and educational authorities is another thing of which every one who is interested in this subject cannot fail to become unpleasantly cognisant. Mr. Eustace Thomas thinks that the very fact of having schools at works at all is evidence that practical men distrust technical teaching; and his does not seem to be an entirely isolated opinion. Mr. Fleming argued in his reply—which will, we understand, be amplified in the Journal—that the works was the proper place to have the school, because by having it there it was possible to get to know the boy himself. As a rule, of course, the teacher never works, and the worker never teaches. Mr. Thomas is himself a notable exception, for he has had years of teaching experience, and now engages in manufacture. Prof. Miles Walker is another, for he was for many years connected with the British Westinghouse Co., and now teaches.

It will already have occurred to the reader that not every works can run an apprentices' school. We are certain, however, that it could be done in more cases than those which now exist, only then we come up against the attitude of "we can't take the risk" of spending—or rather, investing—the capital, to which notice has recently been drawn in another connection.

Even where manufacturing concerns are very small, much might be done by co-operation. Mr. Fleming draws attention to what has been done by Dr. Kirschensteiner at Munich, and to quote:—"In this centre, around which there are a number of comparatively small industrial works, separate classes are arranged for the youths of each trade, and in these classes, apart from the continuation of general education, both practical and theoretical instruction is given in the trade by skilled workmen and special instructors." This system could surely be applied among the numerous metal workers of Birmingham and the Midlands, and the small cutlers and silversmiths of Sheffield, to take only two examples. Co-operation would lead in time to nationalisation, the desirability of which was alluded to by Prof. Walker.

We must not conclude without mentioning the noteworthy fact that financial restrictions are almost entirely removed at the British Westinghouse works. Many promising youths who would otherwise be precluded from obtaining proper training can now improve themselves and make progress, and the benefit is mutual between them and their employers. The apprentice should not be looked upon as part of the machinery, and to obtain the best results employers should remember the important psychological facts that the growing and developing youth needs to be self-supporting—hence he should have a wage better than an unskilled labourer's; to be properly fed—hence not to go too long between meals; and to get proper rest—hence not to be pushed on to overtime as if he were full-grown and well skilled. The recently-published report of the L.C.O. psychologist, Mr. Cyril Burt, is a document which should be studied by those who hope to advance our national well-being in this direction.

THERE was recently a sharp fall in Lead. the price of lead, but it proved to be but transient, and with a renewal of buying upon a moderate scale, and a less defined desire to liquidate metal, the market experienced a good rally, and to-day the level of prices is once more above the £20 level. The weakness which was noticed about a month ago had its origin to a great extent in the tactics of leading dealers, who apparently apprehensive of the United States forcing metal upon the London market to the detriment of the general situation, seized what they regarded as their opportunity and forced down the price. This effectually stopped the offers of American lead, and with a capital demand springing up at the cheaper range of prices then established, there was a steady and sustained upward movement. The fundamental position is sound so far as can be ascertained, the stocks in the United States being very moderate, the returns just available showing that at the end of December the accumu-

lation of foreign lead in American bonded warehouses was only 6,800 tons, or about the same as a month previously, while elsewhere there is no excess of metal apparent. Here there are such difficulties experienced in regard to the discharging of steamers reaching here from Australia and elsewhere that it is sometimes rather hard to get hold of lead out of vessels, and this now and again causes a certain amount of trouble to the trade. The excessive cost of freight is an additional factor contributing to maintain a firm tendency about the market, for it makes it a costly matter to ship lead. There has been a considerable quantity of the metal in Spain awaiting disposal, and it had been feared that this must have a sobering effect upon prices, if the time came for it to be realised, but it now appears that the bulk of this has been sold to France, which country is still a consumer of lead upon an enormous scale, as, too, are all the warring nations, in connection with their military needs. Russian buying has been a matter of great importance for a long time; Russia has been actually taking lead for shipment from America to Vladivostock, and there is still a demand reported for material for prompt dispatch. There is not much chance of this demand per-sisting so far as the United States is concerned, for the time is getting near when it will be possible again to ship material to Russia by way of Archangel, and the opening up of the Dardanelles is bound to make an enormous differ-When ence to the entire course of the campaign in Europe. the seas are swept clear of the baby-killers and their atrocity-friends the Turks, a very definite forward step will have been taken for bringing the "War Lord" to his knees. The general trade demand for lead is poor taking things all round, and the requirements for military purposes constitute the most important branch of consumption. Sellers are less disposed to operate, and the continuance of a pretty firm condition is generally expected. Of course, an improvement in the shipping facilities would mean a good deal to importers, and the more expeditious handling of goods at the Docks would assist to bring down prices of all commodities, but it is probably too much to look for any material relaxation of the difficult attitude of labour, which is partly responsible for the congestion and undue raising of prices.

In our "Notes" columns we are able The to-day to publish some exceptionally in-I.M.E.A. teresting information regarding the work of the Incorporated Municipal Electrical Association. We have on previous occasions referred to the strong position which this Society has attained in the electrical world, where its active policy contrasts with the passive attitude of cer-tain other organisations, and it will be observed that the Development Committee, which, with members co-opted from all branches of the industry, is a very substantial and representative body, is about to commence operations in several directions where progress is urgently needed. constitution of the Committee reflects the liberal views of the Association, and we may be assured that no pedantic or academic scruples regarding commercial matters will hamper its proceedings.

In effect, the Development Committee takes the place that might have been occupied by the Industrial Committee of the I.E.E., and also will discharge the functions of the Society for Electrical Development of the U.S.A., to which we have frequently referred in these pages, and which is officially represented on the Committee. It will be noted, too, that the Sub-Committees themselves are empowered to co-opt persons whose help may be of value, a procedure which is of the greatest service, and ought to be practised in all departments of the State, from the highest to the lowest, but nevertheless is rarely adopted.

. The decision of the Council of the I.M.E.A. to dispense with the customary Convention this year will receive general approval; business meetings, however, will be held, and it is significant that the principal features of these will be the presentation of reports by two active and energetic bodies which, like the Development Committee, have sprung from the I.M.E.A.

The Association is "going strong," and we heartily wish it success in all its undertakings.

# WILL THE IGNITION MAGNETO BE SUPERSEDED?

BY CHAS. J. WEBB, A.I.A.E.

THE European war, although it has only been in progress seven months, has already wrought various unexpected changes, and has brought about many entirely unanticipated positions, some of which are in connection with the motor-car movement. Among those of interest, from an electrical point of view as well as to motorists, is that relating to the question of ignition. Up to the time of the cutbreak of hostilities the makers of a certain magneto had built up such a strong position that, so far as the United Kingdom—one might say the whole of Europe—was concerned, practically every make of car was fitted with one or other models of the magneto in question. True, there were other types of magneto on the market, both at home and abroad, but they received such little encouragement, that their manufacture was only conducted on a relatively small scale, and it is probably from this cause that their construction was not brought to the same high standard of perfection as the German-made article.

There was, of course, a large stock of the latter in this country at the time war was declared, which will, doubtless, enable car manufacturers to carry on for some time, and, in the meantime, a number of magnetos which have hitherto not had their chance of "making good," and others emanating from new, but none the less experienced, firms are making their appearance on the market, so that, with the idea definitely removed that a car is useless unless fitted with the "one and only" type, it is probable that the magneto supply problem will not prove so serious as it appeared to be at the outbreak of the war.

In some quarters, however, the opinion is gaining ground that the outlook for magneto manufacturers is none too bright—that, ere long, the ignition machine they are manufacturing will be superseded. In other words, there is a growing feeling that, since electric lighting installations—practically all of which include a battery of accumulators—have become de rigeur on motor cars, there is no longer any need, seeing that a supply of the current needful for the spark is already available, for the additional complication of a magneto.

THE DEVELOPMENT OF THE IGNITION PROBLEM.

In the early days of the motor movement, as a few of the older motorists have good reason to remember, they having passed through experiences the modern car-owner can hardly imagine, the ignition of the explosive charge in the combustion chamber of the engine was effected by means of a costly platinum tube kept in a state of incandescence by means of a lamp or burner. This was duly superseded by ignition by means of accumulators and coil, which was eventually brought to a relatively high degree of perfection. The main difficulty which could not be overcome, and which in due course led to the introduction, or rather adoption, of the magneto, was that the battery in a short time became exhausted and required recharging. Sometimes, despite all the care that might be taken, the accumulators ran down unexpectedly, most probably as a result of short-circuiting, with the usual result of leaving the motorist stranded "miles from anywhere."

At first the ignition magneto was not the perfect and reliable article it is to-day, and it had a "long, long way" to go ere it won the entire confidence of motorists, dual ignition—accumulators and magneto—being for some years a leading item of the specification of all the principal cars. Gradually, as we all know, the magneto proved itself reliable, so that, finally, it came to be entirely and exclusively relied upon to furnish the vital spark. Yet, there are those who do not regard the magneto as the final form of ignition, especially in view of its one disadvantage that at low engine speeds it will frequently not fire the explosive charge in the cylinders, especially if the points of the sparking plug are dirty, or the mixture is not correct, it being in some quarters held that it was the difficulties experienced in this direction that led to the introduction of engine-starting devices.

THE DOOM OF THE MAGNETO PREDICTED.

The question as to whether the magneto will be superseded is not entirely a new one. It was first mooted some two or three years ago, when it was predicted that sooner or later it would have to fight for its position. The prediction was of course based on the increased popularity of electric lighting for cars. The need of a generator to supply the current for electric lighting, a battery of accumulators for equalising it, and the opportunity for employing the same medium for the starting of the engine were considered an irresistible combination compelling the use of the same equipment to furnish the ignition current, and, consequently, rendering the magneto superfluous. That the dynamo or generator could keep the battery constantly charged was considered as affording a further guarantee that the change would come about as predicted.

The matter is one that, owing to the greater, or perhaps, we should say, earlier popularity of electric lighting and engine starting installations, has received more attention in the United States then in this country, but the fact that the announcements relating to 1915 models made in America show a decrease of, approximately, 30 per cent. in the number of makes of cars fitted with magnetos seems to indicate that the time has arrived when magneto manufacturers in this country should turn their attention to the problem of evolving a combined system of lighting and ignition, and, possibly, engine starting, since they form the class which, obviously, has had the greatest experience of electrical apparatus as applied to motor vehicles. Since the lighting dynamo has been almost universally adopted, it has been possible to design a system of lighting and ignition that has all the advantages of accumulator ignition for starting, and the magneto for running, without any of the disadvantages of either system, and in which there is a large amount of current available at all times; in other words, the amount of current that would run down the batteries formerly used for ignition purposes will not be missed from the accumulators used for engine starting and car lighting, as the dynamo keeps them fully charged.

Early experiments appeared to indicate that an ignition system depending on the same source of energy as an engine-starting motor would not give reliable results, because of the weakening of the spark due to voltage drop when working the starter under adverse conditions. Engine-starting systems have, however, been greatly improved, with the result that specialists in America are now claiming that a point has been reached when no such fears need be entertained.

THE NEW GENERATOR-BATTERY IGNITION SYSTEM.

The generator-battery system, as the modern method is called, introduces nothing new, but, rather, is claimed to eliminate one piece of apparatus about a car, and utilises the equipment already on most vehicles. On starting, the ignition current is taken directly from the accumulators, the latter being what is termed floating on the line. When the engine is in full operation the dynamo starts to supply the current at the proper rate to the battery, and in sufficient quantity not only to supply current for lighting and ignition, but also to keep the battery fully charged.

There is nothing radically new in the components of a combination lighting, starting, and ignition system; there is no connection between them, except that they draw the necessary current from the same ultimate source—the The wiring circuits are entirely independent, that connected with the ignition conducting the low-tension current from the battery to a non-trembler induction coil, the high-tension current from the latter passing through a mechanical circuit-breaker and distributor of practically the same design and construction as used in a magneto. It is claimed for the combination system that since a "fat" spark is obtained at low as well as high motor speeds, the carburetter may be set to work with a weaker mixture than usual, and that, consequently, the petrol consumption is reduced. Furthermore, there is no logical reason why equal engine speeds should not be obtained with the generatorbattery system as with the magneto, while the engines may be throttled down to a lower degree than is possible with the magneto. Among other advantages claimed for the system are that the current is of a constant intensity, since it does not depend on the speed of the engine, while,

as there are no tremblers on the coil, perfect synchronism is obtained in the distribution. We do not overlook the fact that the element of security may not be so great in the case of an installation that is serving a triple purpose, but, after all, this is a question not only of choosing a well-tried system but also of seeing that it is carefully installed, a good deal depending on the way the wiring is carried out.

### SOME CLAIMS FOR THE NEW SYSTEM.

One of the most ardent advocates in this country of the doing away with the magneto is, of course, Mr. F. S. Bennett, of the Cadillac Motor Co., who, in a recent communication, stated that: "Frankly, I believe the magneto was doomed from the day that the combined unit systemlighting, starting, and ignition—was produced, and, fortunately, there is no need to lament its departure in the form it has been generally known, as an equally good ignition system, with the enormous advantage of a perfect form of lighting and self-starting, has arrived to take its place, and, I am convinced, will inevitably do so." Mr. Bennett, after three years' experience of the combination set employed on the car with which he is connected, states that he is to-day "more than ever convinced that the magneto, perfect as it is, is bound to be displaced in Europe, as it has been in America, by some such system. The power is absolutely the same on either generator or magneto ignition, and if there is any preference it lies with the newer system, as the engine will run slower without stopping, and has a wider range of control."

While, perhaps, it is too early for us to express a definite opinion on the new-comer in the field of ignition, yet the fact that it is making great progress on the other side of the Atlantic suggests that the time has arrived when serious consideration should be given to the subject in this country, for whenever a start is made in substituting the new generator-battery ignition for the magneto on Britishbuilt cars, past experience has shown that it will have to go through a period of development and trial until it attains the same degree of reliability at the hands of motorists as that of the present-day magneto.

Finally, although the question whether the war may have the effect of quickening the disappearance of the magneto in favour of the newer system may be an open one, it is sincerely to be hoped that the lesson which the war has taught us in connection with magnetos will be taken to heart, and that never again will anything like a monopoly in connection with any part of the automobile be allowed to establish itself within our borders.

# IMPROVED METHOD OF MAKING JOINTS IN GUTTA-PERCHA-COVERED CORE.

### BY J. RYMER-JONES.

It is not an uncommon experience that joints in the guttapercha core of picked-up cable, and sometimes even in new core, do not always remain as sound electrically as when first made. The cause of weakness is generally traceable to imperfect cohesion between the insulating coverings, due to one or other of the following:—

- (a) Want of cleanliness when handling the joint.
- (b) Moisture left between the coverings owing to insufficient lamping.
- (c) Surface oxidation preventing intimate union between the coverings.
- (d) Deterioration of the gutta due to stock cable not being continuously under water.
- (e) Unequal shrinkage between the gutta of the core and the gutta coverings of the joint, especially at the ends, when subjected to a considerable and sudden change of temperature.
  - (f) Overheating with a too hot tooling iron, &c.

Remedies.—(a) The jointer's hands should be washed with coal tar naphtha to remove ingrained dirt, and then with

wood naphtha, prior to washing with soap and water, and rinsing well.

The surface of both ends of the core should be washed with clean white linen steeped in wood naphtha, and also all the parts to be handled, otherwise the jointer's hands are likely to become dirty again.

- (b) Exclusion of moisture is most effectually secured by using no water, and on no account should saliva be used to moisten the fingers or tools. While closing a seam and manipulating the gutta-percha coverings the fingers should be dipped in wood naphtha, or methylated spirit, preferably the former, which by evaporation makes the hand cool and less likely to perspire in hot climates. The trimming knife, scissors, and cutting pliers, should also be dipped in wood naphtha instead of in water as has hitherto been customary.
- (c) Want of perfect cohesion between the gutta-percha coverings is generally due to oxidation, and, in the case of even new gutta-percha sheet, to the fact that the gutta surface has been in contact with the calender, while rolled into sheet, or exposed to the air. Even after washing the surface of two pieces of gutta-percha sheet with soap and water, rinsing well and drying, it is difficult to make them adhere tightly when lamped and pressed together. Compound greatly improves the cohesion, but it is not always as tenacious as it should be or evenly applied. The remedy is to renew the surface either mechanically, e.g., with a fine but stiff steel wire brush applied all over the gutta sheet; or, preferably, by breaking and mixing the surface with a suitably hot tooling iron. As an alternative and much better expedient the surface of the gutta-percha sheet is renewed chemically by rubbing it with chloroform, or benzole, using a small flat pig's bristle brush for the purpose. These act as solvents, and if the surfaces of two pieces of gutta-percha sheet, so prepared, be lamped and pressed together the adhesion is very tight.

After moistening with chloroform, or benzole, the surfaces may be smeared with a thin film of gutta-percha chloroform or gutta-percha benzole solution; but the cohesion is very good without this solution.

Renewing the surfaces chemically or mechanically secures practically perfect cohesion between the gutta-percha coverings. In fact, cleaning the conductor with chloroform, coating with gutta-percha chloroform solution and lamping well, to evaporate excess of spirit, is also a preferable substitute for the *compound* usually employed; and, moreover, secures the electrical advantage of making the core more homogeneous.

- (d) If the core surface be oxidised, as is frequently the case with old picked up cable, it should be pared with a sharp trimming knife before commencing to draw down the lamped ends, otherwise a deteriorated surface will lose still more of its freshness by lamping and become porous. The new gutta-percha sheet will consequently not mix so well with the old core even when the latter is treated with the solvent or solution, and the joint will probably soon develop electrical weakness by leakage between the old and the new surfaces.
- If the thickness of the old gutta-percha covering is very small, there is little chance of making a durable joint, and the old core had better be stripped and its value realised.
- (e) The more intimate the union brought about between the gutta-percha coverings by chemically preparing their surfaces, the less likely is the joint to develop weakness under trying changes from wet to dry, to which a cable is sometimes subjected in storage tanks; or under unequal contraction and expansion between the core and gutta-percha sheet brought about by great and sudden changes of temperature.

EXPERIMENTAL JOINTS MADE IN GUTTA-PERCHA CORE.

Ends cleaned with wood naphtha or methylated spirit and thin film pared off with trimming before lamping and drawing down. Wood naphtha (*), or methylated spirit (†) used to moisten fingers and tools.

### INDIAN NOTES.

[FROM OUR SPECIAL CORRESPONDENT.]

Calcutta Port Trust.-Before the war there was much con-Calcutta Port Trust.—Before the war there was much congestion at the Calcutta jetties owing to the enormous increase in import shipping, and it was decided to increase unloading facilities and extend the docks. Accordingly orders were placed with Messrs. Pyne, Hughman & Co., after severe competition, for 13 two-ton electric goods lifts in 1913. Last month a repeat order was placed with the same firm for 17 electric goods lifts. This they claim to be the largest lift order ever placed in India with one firm.

Tuta Hudro-Flectric Scheme, Bombay —This large enter-

Tata Hydro-Electric Scheme, Bombay.—This large enterprise is now nearing completion. The Lonavla dam is almost completed and the Walhwan dam should be ready by March next. Four generators and turbines with their auxiliary plant are completed, and the transmission line is in its last stages. With average luck energy should be available in the Bombay mills by the end of March to the extent of 40,000 horse-power.

horse-power.

The Times of India writes as follows of the undertaking:—
"The scheme is going to banish smoke from Bombay. It is going to provide our industries with the most efficient motive power, so much smoother in its action than steam that it greatly increases the efficiency of machinery. It is going to stimulate industry by furnishing power far more cheaply than steam engines and boilers can be installed. It is going to provide a basis for fresh industries all along the country traversed by the transmission line and perhaps to facilitate the electrification of the suburban railways and Ghat sections of the Great Indian Peninsula Railway. Once cheap and abundant electrical energy is introduced into an industrial centre no one can place a limit on its usefulness. The present plans provide for about one hundred thousand horse-power, but the Ghats can supply such further quantity as

present plans provide for about one numered thousand horsepower, but the Ghats can supply such further quantity as
may be necessary to meet the demands of the city."

I.E.E., Calcutta.—The local Centre of the I.E.E. held its
opening meeting in Calcutta recently, and in the unavoidable
absence of the Chairman (Professor Everett), Mr. A. K.
Taylor read his opening address to a small but appreciative audience.

Delhi.—Mr. J. S. Pitkeathly, C.V.O., has returned from six months' leave in England, and has taken up his duties as electrical engineer, New Province, Delhi. During his absence Mr. F. W. Symes, his assistant, officiated in his stead and carried out his trying duties in a very able manner.

and carried out his trying duties in a very able manner.

Karachi.—At the opening ceremony of the new City Electric Lighting Works recently, what is described in the newspapers as an epoch-making event in the civic history of Karachi, happened. In inviting the Commissioner to close the main switch to start the town supply, the Chairman of the Electric Corporation, the Hon. Mr. M. de P. Webb, incidentally referred to the war, remarking, "I am one of those who deplore the use of that stupid phrase 'business as usual,' because it reveals the boasting and bragging and pretending frame of mind which will assuredly be the ruin of Germany. Business is not as usual, and never can be until the war is ended." The Commissioner, in reply, denied that the adoption of the motto connoted boasting or bragging. Something more imperial than that, he went on to say, was implied. "Business as usual" was a plain announcement that despite all the terrors of war, without regard to the suffering of mind, body as usual" was a plain announcement that despite all the terrors of war, without regard to the suffering of mind, body and estate that must inevitably result, every man and woman in the Empire would tackle the job that came to hand and would do his or her duty. The manner in which the Empire has lived up to its war-derived motto is sufficient indication that there was neither boasting nor bragging in its "business as usual." This pointed rebuke is considered by many to be not unmorited. not unmerited.

Metal Filament Lamps.—The price of most things, including electrical material, has gone up in India since the war began, except the rates for metal lamps. Due to the insane cutting of prices among Indian contractors, it is possible to buy 225-volt metal lamps in India in gross quantities at 14 annas, or one shilling and twopence each!

### OUR LEGAL QUERY COLUMN.

"Enquirer" writes:—"I shall be glad if you will kindly give me information on the following circumstances:—
"A consumer on the municipal supply has several electric motors which have been in use for some years; supply is given at low pressure (100 volts). He has recently applied for supply to another motor, and is informed that he will receive supply at a higher pressure (200 volts), and for this it will be necessary to run a new cable across a street to his premises, and he is asked to give a guarantee that he will pay a minimum of 20 per cent. on the outlay in laying this new main.

"He has not been asked for a similar guarantee for his previous motors, and this one is simply an extension of his

installation. He pays the ordinary advertised rates for his current.

Can the Corporation demand this guarantee?

at the consumer would be quite content to receive supply at the old pressure, but the Corporation explain that it would overload the main, and probably affect the lighting in the neighbourhood.

**• S. 27 (1) of the Schedule to the Electric Lighting (Clauses) Act, 1899, provides that "The undertakers shall, upon being required to do so by the owner or occupier of any premises situate within fifty yards from any distributing main of the undertakers . . . . give and continue to give a supply of energy . . . subject to the following conditions. The cost . . . of so much of any such electric lines as it may be necessary to lay for a greater distance than 6) ft. from any distributing main of the undertakers . . . . shall if the undertakers so require be defrayed by that owner or occupier."

shall if the undertakers so require be defrayed by that owner or occupier."

Sub-section (2) of the same Section provides that: "Every owner or occupier of premises requiring a supply of energy shall (b), If required by the undertakers, enter into a written contract with them to continue to receive and pay for a supply of energy for a period of at least two years of such an amount that the payment to be made for the supply, at the rate of charge for the time being charged by the undertakers for a supply of energy to ordinary consumers within the area of supply, shall not be less than 20 per cent. per annum on the outlay incurred by the undertakers in providing any electric lines required under this Section to be provided by them for the purposes of the supply, and if required by the undertakers give to them security for the payment to them of all moneys which may become due to them by the owner or occupier in respect of any electric lines to be supplied by them." The foregoing provisions make it plain that in the circumstances mentioned by "Enquirer" the guarantee can be demanded. The undertakers are not bound to demand it; but if they do the demand must be met.

### LEGAL.

### PREPAYMENT METER PROSECUTION DISMISSED.

AT Wednesbury Police Court on Friday in 1sst week, Florence Williams, Wednesbury, was charged with stealing electricity, the property of the Corporation.

The TOWN CLERK (Mr. T. Jones) prosecuted, and stated that on January 9:h an employé of the Corporation went to defendant's house in order to change a shilling-in-the-slot meter for one taking pennies. The money in the meter was counted out, there being 7s. In addition there were two washers and a farthing. The indicator registered 8s., which showed that the farthing and the small washer had not used any electricity, but that the larger washer had. When the employ  $\acute{e}$  told defendant she was liable to be punished, she made reply that if she had had more washers she would have put more in the meter, as she had not had sufficient light for her money. The Town Clerk added that he did not press for a

for her money. The Town Clerk added that he did not press for a heavy penalty, but the practice could not be tolerated.

Evidence was given bearing out the above statement, and William Hunt, the employé, in examination, denied that he ever told defendant she could put in washers if she had not got a

shilling.

DEFENDANT, on oath, declared that the employé did tell her she could place a washer in the meter if she had not got a shilling, and make it right when the "state" was taken.

The Banch decided to dismiss the case.

### AUTO-ROTO SYNDICATE, LTD., v. PAUL & CALLARD.

In the City of London Court, on Friday, before his Honour Judge Rent ul, K.C., plaintiffs, who are advertising contractors, of 32, Fanchurch Street, E.C., sued Messrs. Paul & Callard, High Street, Streatham, for £6, for 12 months' advertisements affixed to an electrically-propelled machine, at 10s. a month.

Mr. Louis Green appeared for the plaintiffs, and Mr. S. Duncan for the defendants.

There were three other cases against traders in Streatham, and it was agreed that the decision in the first case should determine

MR GREEN stated that the plaintiffs made a contract with the defendants on June 29th, by which they agreed to let defendants an advertisement for 12 months from its first showing on the plaintiffs' auto-roto machine, which was electrically propelled, plainting auto-rote machine, which was electrically propelled, and was affixed at the junction of Mitcham Lane and Streatham High Road to the side wall. Defendants were to supply suitable advertising matter, and it was to be subject to the approval of the plaintiffs. The money was payable in advance. The machine revolved with the advertisements upon it. A poster of revolved was prepared containing matters of received the superior of the state. or sketch was prepared containing matter advertising defendants' business. Defendants approved of it, and although the machine was started in July the defendants were not charged until September. On August 28th defendants wrote and said that in accordance with the contract they gave notice that

they required the immediate removal of their advertisement from That repudiation was ineffective. and plaintiffs wrote and said the advertisement had started, and that having regard to the expense of preparing the poster they could not accept the repudiation of the order unless they paid for the first 12 months' rent. On September 3rd defendants replied that any legal claim did not affect their right to withdraw the advertisement of which they disapproved, or lessen their liability to carry out the instructions. They also said the machine was not placed in accordance with representations made as to the position, and that the exetch was bad. They further alleged that the machine was defective in working. There was no doubt that it raced because it was electrically driven. It did not work accourately. Sometime before September 1st plaintiffs' electrician got it into working order and controlled it. When the defects had been remedied and the machine got into working order, plaintiffs gave defendants notice that payment would begin. Therefore the defendants had had some of the advertisements for nothing. 2nd plaintiffs wrote and said the advertisement had started, and nothing.

Ms. Dungan said the permission of the Wandsworth Borough Council was not obtained by the plaintiffs before putting up the machine, and when it had been erected the Council told the plaintiffs to take it down or to put it in a different place. Where the machine was to have been placed the advertisement could be seen from the approaches in four roads, but where it had been

placed it could only be seen in one road.

MR. GREEN replied that there was no implied authority that the plaintiffs were to get the consent of the Borough Council. The machine was still up, and the advertisement was still running.

After hearing evidence the Court gave judgment for the defendants, with costs in each of the four cases.

### TELEPHONE INSTALLATION CASE.

SHERIFF ABMOUR HANNAY, Kirkcaldy, has heard parties in the preliminary pleas in an action at the instance of the Caledonian Telephone (New System) Co., Ltd., Glasgow, against Tullis, Russell & Co., Ltd., paper manufacturers, Auchmuty, Markinch. Pursuers asked the Court to ordain defenders to pay a sum of £137 19s., with expenses. They aver that on March 17th and 24th, 1914, defenders entered into two contracts with them for the installation of certain telephone instruments at a certain reptal and under certain conditions. In terms of the contracts pursuers and under certain conditions. In terms of the contracts pursuers erected an installation in defenders' premises, the annual rental being £14 12s. Defenders aver that the contracts were signed only by their secretary, whereas in order to be binding on defenders they required under their articles of a sociation to be sealed with the company's seal and subscribed on behalf of the company by two directors or by one director and the secretary. They maintained the contracts had been signed by their secretary under essential error, and that the error was induced by the pursuers or their articles where a secretary when the secretary under the secretary their secretary under the secretary their secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the secretary under the sec their representative, who was aware of this at the time. They aver that pursuers' representative assured their secretary that the quarterly or annual rent entirely covered their secretary that the quarterly or annual rent entirely covered the erection and capital cost of the installation. They repudiated liability for a period of 21 years or any other number of years. To save further trouble and expense they had already made a tender of £140. They aver that the contracts are not binding beyond the obligation to pay the annual rent so long as they retain and use the installation. His Lordship made avizandum.

BARCELONA TRACTION, LIGHT AND POWER CO.: MACKENZIE * THE COMPANY.

On February 25th, in the Chancery Division, Mr. Justice Eve heard a motion in this matter.

MR. GORE BROWN, K.C., who appeared on behalf of Mrs. Byrne, one of the parties in the action, said his motion was that Mr. Whinney should be appointed Receiver of the company in the place of Mr. McAuliffe, the gentleman already appointed as Receiver. No suggestion was made against Mr. McAuliffe, but it was thought by Mrs. Byrne and her supporters that the interests of the bond-holders would be better served if Mr. Whinney was appointed. The company was registered in September, 1911, and was formed The company was registered in September, 1911, and was formed under the laws of the Dominion of Canada, and its head office was at Toronto. It was formed for the purpose of developing water power and electric traction and tramways in Spain, and was, without doubt, a very large business. According to the balance-sheet of Docember 31st, 1913, which was the last one issued, there was outstanding capital of 27 millions of dollars in ordinary stock. and 8 millions of dollars in preference stock. There was also an issue of 8 million pounds' worth of bonds, and it was with regard to this issue that the Receiver had been appointed, and the present

maplication was made.

MR. JUSTICE EVE: These were bonds to bearer?

Counsel: Yes. Mr. Gore Brown added that Mrs. Byrne and others interested with her held a substantial number of the bonds, while the plaintiff, Mr. Mackenzie, held £20,000 worth and had

received support from people holding altogether four millions.

Asked what were the grounds for his application, MR GORE
BROWN said the action was commenced by Mr. Mackenzie really at the suggestion of the directors of the company, and while he was not suggesting any improper motive or dishonest conduct on the part of any of the gentlemen concerned, when they were dealing with the affairs of a company of this kind they wanted to be assured that the Receiver had an absolute independence of action. There was reason to believe that the Receiver worked with the directors to a certain extent, and received instructions from them, and when there was a working together in that way there could

not be the strictest and independent investigation which the matter demanded. Mr. McAuliffe was once a directer of the company, and was one of its auditors.

His LORDSHIP said he understood that there was to be a scheme repared, and when that came before the Court he would see that

all the parties interested were protected.

MR. GORE BROWN said that would serve his purpose, and eventually the motion was adjourned and no order was made.

#### A.E.G. ELECTRIC CO. v. SEMPLE.

At the Westminster County Court last week, the plaintiffs, of Oxford Street, London, sued defendant, a Battersea Park butcher, for £2 13s. 5d., the price of an ammeter supplied to him. Defendant said that when he ordered the instrument he thought that the plaintiffs were an English company, but he subsequently dispovered that the company was composed of Germans, and that all the shares (£150,000), with the exception of seven, were held by Germans. He had also returned the instrument as defective, but they sent it back and he refused to take it in, and for some months it was in the possession of the L. & N.W. R. parcels delivery office. Plaintiffs said that the instrument was not defective. Defenden

dant said that he refused to pay any money whatever so as to protect himself from being charged under the Defence of the Realm Act.

The JUDGE said that the defendant had now made his protest, but that was not to the point. He adjourned the case for defendant to call the man who fitted the instrument,

### RUTHENBERG v. BRITISH ABRASIVE WHEEL Co.

MR. MARCUS RUTHENBERG, the inventor of an electric furnace. was, on Monday, March 1st, plaintiff in an action before Mr. Pollock, High Courts Referee, against the defendants, of Victoria Street, Westminster, in which he sought to recover £976, balance of account for goods sold and delivered and for work done.

Mr. Tyler appeared for the plaintiff, and Mr. Clavel Salter, K.C., with Mr. Maddox, for the defendants.

with Mr. Maddox, for the defendants.

According to the plaintiff's case, he was employed by the defendant company, whose business is to make abrasives, which are of intense hardness, for the purpose of making grinding wheels, to supply them with one of his electric furnaces at a cost of £1,100. To this was added £215 for additional gear and other matters, bringing up the total indebtedness to £1,376 16s., including £33 16s. paid by the plaintiff, on behalf of the defendants, to the Union Electric Co., Ltd. The defendants had paid two cheques of £200 each, reducing the balance to the amount claimed.

The defence was a general denial of indebtedness, and a counter-

each, reducing the balance to the amount claimed.

The defence was a general denial of indebtedness, and a counterclaim for £1,600, including the £400 paid on account, on the ground that the whole thing was worthless. The agreement between the parties was contained in the correspondence which passed, and a large number of letters were put in evidence, and it was said that by those letters, and partly verbally, the plaintiff agreed to supply an electric furnace of such construction that it could be worked in a satisfactory manner and smelt bauxite or alumina, pure or impure, into a fluid mass and make a product in every way the same as that made at Niegara Falle. The defendants said that there was an implied warranty, and that the furnace was defective and did not do its work properly. A portion of the defective and did not do its work properly. A portion of the plaintiff's claim was in respect of an amperemeter for each electrode reading to the maximum demands, and a voltmeter also reading to the maximum demands for the circuit, mounted on a elate panel. The plaintiff admitted the agreement, but denied that the transformer, or anything else, was defective as alleged, but alternatively said that if it was defective the transformer was rendered so by reason of the defendants having allowed the insulation to absorb moisture, and by reason of tests to which it was subjected by the defendants or their agents. He denied that he had committed any breach of the agreement, or that his work was defective, unless defects had been created by the furnace having been erected without proper skill by the defendants, and by working it in an improper manner.

(To be continued.)

### TUNGSTEE DRAWN WIRE .- PETITION FOR LICENCE.

In the Chancery Division on Monday, March 1st, Mr. Justice Warrington commenced the hearing of a petition by the Robin Electric Lamp Co., Ltd., for a licence to make, use and vend tungsten wire in accordance with the inventions covered by the Tungsten Lamp Association patents, or any of them, upon payment of "such royalties as shall in the circumstances be deemed reasonable."

The petition was opposed by the British Thomson-Houston Co.,

Ltd., and Messrs. Siemens Bros. & Co., Ltd.

Mr. Bousfield, K.C., Mr. Cave, K.C., M.P., and Mr. R. Frost appeared for the petitioners; Mr. Walter, K.C., Mr. J. H. Gray and Mr. E. Lunge for the Thomson-Houston Co., and Mr. Colefax, K.C., and Mr. Hume for the Siemens Co.

MR. BOUSFIELD said the petitioners were a company formed to work a patent of Mr. Joseph Theodore Robin for a lamp which had two filaments instead of one. By such a lamp one secured this, that if one filament broke, a person could by giving a turn to an attachment to the lamp bring in another filament, so that the lamp started with a new lease of life. Since the day of the squirted lamp, the drawn-wire lamp had come in, and it was better as regarded both efficiency and durability. One's lamp bill might approach to something of the dimensions of the electricity bill; a little more durability in the lamp therefore made a great deal of difference, and 90 per cent. roughly of the lamps sold to-day were drawn-wire lamps. The petition recited the nine patents under which the petitioners asked for a licence. The patents were this, that if one filament broke, a person could by giving a turn to

referred to as the Association patents. The B.T.H. owned a group of patents of American origin, and Siemens Bros. owned a group of patents of German origin. These two companies, together with the Oaram Lamp Co. who owned another group of patents, pooled their patents. The total number of them was together with the Osram Lamp Co. who owned another group of patents, pooled their patents. The total number of them was something like 150. They pooled their lamp patents and jointly granted licences to anybody who came into the Association, the main condition being that the member of the Association should sell to the retailer at a certain list price. The petitioners had taken out from the list the only nine patents that referred to the manufacture of the drawn wire. If they got a supply of drawn wire they would be content without the licence, because the sale of the wire carried the licence to use it; but not being able to get it they asked to have a compulsory licence. The petitioners had applied to the patentees and their various licensees for the supply of drawn tungsten wire covered by the Association patents, and had in each case been met with a refusal to supply patents, and had in each case been met with a refusal to supply wire or to grant a licence except in the case of the British Thomson-Houston Co., who, when applied to, offered to sall to the petitioners wire at 125s, per 1,000 ft. for lamps for 25 watts up to 100 watts at 100 volts. That price was wholly unreasonable and prohibitive, for with wire at that price the petitioners would not be able to place their lamp on the market with any reasonable. be able to place their lamp on the market with any reasonable prospect of success. The petitioners could obtain wire similar to that used by the patentees and their licensees in lamps sold under the protection of the Association patents from various sources abroad at a price of about 40a.

COUNSEL, commenting on the price proposed to be charged for the wire—125s, per 1,000 ft.—said the cost of manufacturing the lamp was 4d., and the price of the wire for a single-filament lamp lamp was 4d., and the price of the wire for a single-nument lamp would be 5d., and for a double-filament lamp 10d. A great deal would turn on what was a fair price. As members of the public the petitioners were entitled to be supplied with wire without questions being asked. But the patenters were holding up the price of wire on unreasonable terms in order to suit the purpose of a combination which was formed to bean up the price of electric a combination which was formed to keep up the price of electric lamps. A drawn-wire filament lamp which was sold here at 2s. 6d. could be purchased abroad for about 10d. The cost of the lamp was something under 4d. The filament cost ½d. As one group of patents was American and the other German, in the natural order of things they would have had two sets of manufacturers competing with each other and the price would have been kept down; but directly these two combined there were no competitors, and the combination fixed the price and said: "Unless you sell your lamps at this price we shall not supply you." There was obviously a fear in the mind of the Association that if the petitioners were to sell a double-life lamp at 2s. 9d., the public would not pay 2s. 6d. for a single-life. So the Association said:

"You must not be price or give reals for the wice." would not pay 2s. 6d. for a single-life. So the Association said:—
"You must put 1s. on the price, or give us 1s. for the wire."
The price of the lamp in Germany, where the German patents were running, was 1s. 9d., and in Holland, where the patent did not run, the price was 10d. A charge to the public of 3d. for two flaments would be quite reasonable, but they were asked to put on the Control were the patent of the public of 3d. lis. Counsel went on to say that competition had been artificially interfered with in this case by the two groups, and the combination was not entitled to ask for a royalty on the basis of that artificial condition of things, which was created by joining the groups together, so as to get rid of competition. This wire could be bought in the open market in Switzerland at a price which worked out at id a metre. worked out at 1d. a metre.

(To be continued.)

### TRAMWAY ACCIDENT CLAIM.

THE trial concluded in a Scottish Court of Session, on Friday, of the action in which a Johnstone doctor sued the Paisley District Tramways Co., for £500 damages for personal injuries and for damage to his motor car. The case arose over a collision between a tramcar and the doctor's motor. Defenders denied fault and pleaded contributory negligence. The jury returned a verdict for pursuer and assessed the damages at £400.

FALLON v. MIDDLETON ELECTRIC TRACTION CO., LTD. AT the Manchester Assizer, on February 24th, before Mr. Justice At the Manchester Assizee, on February 24th, before Mr. Justice Sankey and a jury, the wife and two daughters of James Fallon, greengrocerland fishmonger, of Rochdale, who died as the result of an accident at Castleton, claimed damages, under Lord Campbell's Act, from the Middleton Electric Traction Co., Ltd. It was alleged that Fallon's death was due to the negligent driving of the defendant company's tramear, which ran into the back of the cart that Fallon was driving. In the result, the widow was awarded £300 and the two daughters £25 each.

OSRAM v. POPE'S ELECTRIC LAMP CO., LTD.

In the Chancery Division on Tuesday, before Mr. Justice Eve, an application was made by Mr. O. Terrell for the postponement of the trial of this action. He said the ground was the convenience of counsel. The hearing was fixed for the 15th inst., but counsel (Mr. Russell Clark) was engaged on a great public duty, and he could not be ready before the 25th inst.

MB. A. J. WALTER, K.C., said that would only leave four working days for the hearing, and as it was an extremely heavy patent action it could not be finished before the Courts rose. He suggested that it should be fixed for the 22nd. If that was not suitable there were two judges who were looking for work, and it might possibly come before them.

His LORDSHIP said he would mention it to Mr. Justice Warring-

ton if the parties wished.

Eventually his Lordship fixed the hearing for not before the 22nd inst., to be mentioned 10 days before that date.

BRITISH INSULATED AND HRISBY CABLES, Ltd., v. CRITTALL MANUFACTURING Co., Ltd.

On Monday, in the Official Referee's Court, Mr. Muir Mackensie commenced the hearing of this action for the recovery of £544, the price of an electric welding machine, &c. The hearing was adjourned. We shall report the case next week.

Hamilton r. Marconi's Wireless Telegraph Co, Ltd. THIS case was to come on in the King's Bench Division on Wednesday.

### BUSINESS NOTES.

Competing with the Enemy.—The staff and heads of departments of the Efandem Co., Ltd., Fallings Park, Wolverhampton, dined together at the Victoria Hotel last Friday evening, under the presidency of Mr. W. J. Fahn (director), who, in replying to a toast, referred to some of the effects of the War upon the business of the company as electrical and mechanical engin manufacturers. He explained how in 1911, from a small experi-mental business in Birmingham, they decided to erect works in Wolverhampton, and carried on the manufacture of goods which were never before made in this country. They had to compete with Continental firms, and were fairly successful from the start. Orders from the first were in excess of the output, and for three years the history of the company was one of rapid development. In 1912 they had nearly doubled their buildings and plant, and in 1912 they had a capacity for production which was more important than that possessed by any other single manufacturer in the world; that was to say in two particular lines—for portable electricity and electric car-lighting sets and motor self-starters. Then the War broke out. A great deal of their raw material came from abroad, and material obtained from our present greatest enemies solud, and material obtained. They were consequently faced by a terrible situation. Fortunately, they had enough raw material stocked to tide them over until new countries of supply could be found. But the price of raw material went up, and the cost of transportation from the United States went up every month. Although they had a large production in portable electricity, it was impossible to supply the demand. As regarded the future, the prospects were absolutely secure. Manufacturers were getting busy in pleasure motor-cars, and though the electrical trade for them had been rather upset, it seemed that in the next few months it was going to rapidly increase.

Great London Fair.—Both the Agricultural Hall and Olympia have been engaged for a London Fair and Market on a gigantic scale in March, 1916. Among the various sections will be those relating to hardware in every branch, lighting, heating and cooking appliances, and electrical apparatus. Each hall will have its complete sections, and a fleet of motor-cars will be employed to convey visitors from one hall to the other. The organisers are the International Trade Exhibitions, Ltd., Broad Street House, London E.C.

Swiss Information Office.—An office has been opened at Zurich for the economic development of Switzerland; it is controlled and financed by the Exhibitions Department of the Swiss Government, and is intended to furnish information free of cost to all who desire to purchase Swiss products, or to sell their wares in Switzerland. Inquiries on trade matters should be addressed to the Secrétariat Général, Bureau Suisse de Renseignements pour l'Achat et la Vente de Marchandises, Metropol, Börsenstrasse 10, I. Etage, Zürich, Switzerland.

Catalogues and Lists. — From Messrs. Alfred GRAHAM & Co, of St. Andrew's Works, Crofton Park, London, S.E., we have received one of their useful desk blotting pads with daily diary for 1915 at left hand. The firm's patent loud-speaking Naval telephones, also telephones for military, mercantile marine, mining, and other service, are well kept before the mind of the user

of the pad,
Mesers. Graham have also sent us a copy of their useful little annual pocket-book of tide and speed tables for 1915. Shipping departments doubtless find it of considerable service.

THE SLOAN ELECTRICAL CO., LTD., 12, Golden Lane, London, 3.C.—18-page illustrated pamphlet giving particulars and prices of S.L." weatherproof and watertight lanterns for half-watt lamps,

"S.L." weatherproof and watertight lanterns for half-watt lamps, also bulkhead fittings, hand lamps, and English china fittings.

British Thomson-Houston Co., Ltd., Rugby.—Four new publications, arranged and illustrated in their standard form and style, as follows:—No. 2,256 (24 pp.) type D R, continuous-current motors; No. 2,216 (8 pp.) type D R, continuous-current generators; No. 5,801 (4 pp.) A.C. brake magnets, two-phase and three-phase, 25 to 50 cycles, for up to 600 volts; No. 4,503 (8 pp.) lightning arresters for A.C. circuits—multi-gap type with graded shunt resistance. Prices are given in most cases.

ELECTRIC SUCTION CLEANER Co., 56, Victoria Street, West-minster, S.W.—A folder card which on the outside asks: "Who's the Lady"? tells inside that she is one who owns a Frant Premier electric suction cleaner, and says -

Shopkeepers and others who, under war conditions, are required to shield their window and showroom lights will find some card-board lanterns which are being distributed by the EDISON & SWAN UNITED ELECTRIC LIGHT Co., LTD., Ponder's End, very serviceable.

Book Notices .- The Engineer's Year-Book of Formulæ, Rules, Tables, Data, &c., for 1915. By H. R. Kempe, M.Inst.C.E. London: Crosby Lockwood & Son. Price 15s.—This is the twenty-second year of publication of a work which has established itself in public favour, and the volume consists of 1,800 pages, with 35 sections, several of which have been practically re-written. Amongst the latter are "Power Transmission," "Steam," and "Ball and Roller Bearings," the last-named by Prof. John Goodman, All the other sections have been revised by the specialists who take the other sections have been revised by the specialists who take charge of them, and whose names form an imposing list. By special permission, the Editor has been able to include a number of official regulations, specifications, &c. So familiar a work needs no recommendation.

The Magazine of the Finsbury Technical College and Old Students' Association for January contains a portrait of the president, Mr. John E. Raworth, a note on "Phase-Advancers," by J. K. Catterson-Smith, and articles on "Active Service with the London Electrical Engineers," by J. F. Perrin; "Humphrey Pumps," by J. G. Bulger; and "The Diseases of a Field Force," by R. F. Easton, There is also a Roll of Honour of past students. studente.

"Colliery and Mining Machinery (Bulletin No. 7)." Part I. London: General Electric Co., Ltd.

"Journal of the Institution of Electrical Engineers." Vol. LIII, "Journal of the Institution of Electrical Engineers." Vol. L111, No. 243. March 1st, 1915. This issue contains paper on "Conditions Affecting the Variations in Strength of Wireless Signals," by Prof. E. W. Marchant; "How a Top Stands Up," by J. Swinburne; and "Representation of the Magnetisation Losses in Iron," by N. W. McLachlan; also a "Third List" of 70 members of the Institution who are serving with the Coloure.

"Science Abstracts." Sections A and B. Vol. XVIII, Part 2. February 25th, 1915. London: E. & F. N. Spon. Price 1s. 6d. each net.

Trade Announcements.—Owing to increased business MESSES. G. E. TAYLOR & Co. have taken larger premises, at 7, Suffolk Lane, Cannon Street, E.C., and all communications should

now be addressed there.

The address of MESSES. CREED, BILLE & Co., LTD., is now Telegraph Works, Croydon. Rapid business developments having rendered larger works necessary, the Skating Rink, a large and central building adjoining East Croydon Station was secured, and it has been specially adapted for the firm's work. Adjoining land

messes. Pitters Ventilating and Enginement Co., Ltd., has removed its offices to the works—33, Nightingale Vale, Woolwich, S.E.—and all communications should be addressed there. New telephone number: Woolwich 427.

THE DUSSEK BITUMEN Co. has changed its address to its additional works—Empress Wharf, Sherman Street, Bromley-by-Bow, E.—and all correspondence should be sent there, though certain of company's products will still be made at the Deptford works.

ME. H. WITTUSEN, whose dissolution of partnership we announced veral weeks ago, is continuing to trade as Harry Wittusen & Co., at 24, Thavies Inn, Holborn Circus, E.C.

Bankruptcy Proceedings. — G. J. T. J. Parfitt, consulting electrical engineer, Keynsham, Bristol.—First meeting, March 10th, at 26, Baldwin Street, Bristol. Public examination, April 16th, at the Guildhall, Bristol.

G. Burgess (Granville Burgess & Co.), electrical engineer, 27, Museum Chambers, Bury Street, W.C.—Last day for proofs for dividend, March 17th. Trustee, Mr. E. L. Hough, Official Receiver, Carey Street, W.C.

New Zealand.—A Christchurch firm wants to represent a British firm making electric self-starting sets for marine use, which must retail at £10 or less. Apply to H.M. Trade Commissioner, P.O. Box 369, Wellington.

Russian Equivalent Tables,—The Central Translations Institute, Ltd., of 265, Strand, London, W.C., have compiled from official sources a set of Russian equivalent tables, and have issued it at the price of 1s. net. In view of the increasing importance of trade with Russia the issue of such information regarding the somewhat complicated Russian weights and measures, and especially of equivalent tables permitting of instant conversion of British weights, measures and money into Russian, and vice rerad, should be of interest to the trading community. The tables cover all ordinary commercial requirements.

Liquidations.—Apparatus and Accessories, Ltd.-Mr. G. E. Corfield, the Receiver and liquidator, reports that, as a result of the satisfactory realisation of the assets of the company, he has collected sufficient funds to provide an immediate distribution of the balance required to make up the agreed composition of 10s. in the £. In addition to the first distribution of 2s. 6d. already paid, a further 7s. 63. in the £ is now being paid.

DETTIFOSS POWER Co., LTD.—A meeting will be held at Winchester House. E.C., on April 15th, to hear an account of the winding up from the liquidator, Mr. H. A. McMahon.

-Battersea electricity department have for disposal a travelling dock elevator track, and horizontal travelling conveyor. Stockport Corporation has for sale one 720-B.H.P. triple-expansion Belliss & Morcom high-speed engine. Particulars are given in our advertisement pages to-day.

A Siemens Dance.—A dance was held at Mozart House, Albion Road, N.E., on Friday, February 26th, for members House, Albion Road, N.E., on Friday, February 26th, for members of the Siemens Dalston staff and friends. Owing to the war fewer social events have been arranged, and as in previous years it had been customary to hold three dances during the winter session it was felt that just one evening's jollification could not be denied. A company of about 70 assembled. Mr. Dennison acted as hon. M.C., and the arrangements were in the hands of the following Committee:—Miss Moloney, Miss Topper, Mr. Dennison, and Mr. Pryor (hop. sec.) Pryor (hon. sec.).

Italy.—An agent in Florence wants to represent a British firm of manufacturers of electrical appliances. Apply Board of Trade C.I. Department in London.

### LIGHTING and POWER NOTES.

Aberdeen.-The Corporation Electricity Committee is to renew the agreement for the lighting of Culter on the terms suggested by the engineer. The consumption of electricity in the city in January was 1,250,610 units, an increase of 67,332 units compared with the same month last year.

Audenshaw.—The U.D.C. has decided to oppose the Stalybridge Joint Board's Electricity Bill.

-The T.C. on Monday agreed to the electrical engineer extending the extra high-tension ring main at an estimated cost of £2,242.

Beeleek (Co. Fermanagh).—PUBLIC LIGHTING.— The L.G.B. has sanctioned the application of the R.D.C. for powers to enable it to carry out the public lighting of the town by electricity.

Belfast. -- Power Station Extensions. - The City Council has decided not to proceed with the extension of the power station at present. It was stated that in three years, the contribution from the tramways to the rates had fallen from £23,000 to £3,000.

Brighton.—RESTRICTED LIGHTING.—The Estimates sub-Committee of the Lighting Committee, reporting on the next year's estimates, recommends that the item for electricity supply for street lighting be reduced from £7,500 to £3,650, and for gas from £1,100 to £550, on the assumption that only one-half of the normal supply of electricity and gas will be used owing to restricted lighting. There will be a reduction of £500 in the item for trimming the lamps, owing to metallic-filament lamps being substituted for the arc lamps; and the estimated total saving on public lighting is £5,000. The Committee points out that the reduction in the amount of energy consumed for public lighting public lighting is £5,000. The Committee points out that the reduction in the amount of energy consumed for public lighting during the next financial year will result in a decrease in revenue to the electricity department of £4,450, and the engineer estimates that there will be a net loss of £2,500, assuming the price of current remains at  $1\frac{1}{4}$ d. per unit. The Finance Committee states that any deficit will be defrayed out of the reserve fund.

Bristol.—Proposed Bulk Supply.—The T.C. has applied to the B. of T. for an order authorising it to supply current in bulk to the Clevedon, Portishead and District Electric Supply Co., Ltd.

Burnley.—RATE RELIEF.—The electricity department estimates the surplus for the relief of rates for the current year ending March, at £5,247.

Ceylon.—The Government has granted permission to Messrs. Walker, Sons & Co. to prepare a scheme for lighting the municipality of Ottacamund by the generation of power from the outflow of the St. Lawrence lake. The municipality proposes to borrow Rs.1 lakh to carry out the scheme.—(eylon Observer.

Continental. -TURKEY .- It is reported that the stores of coal at Constantinople are becoming exhausted, and that the manufacture of gas and electricity will shortly be impossible.

Coventry.—Lighting Artisans' DWELLINGS.—The City Council has decided that the rate for the supply of light in artisans' dwellings erected by the Corporation should be for a house containing three lamps 7½d, per week; four lamps, 9d, the charges to include the provision and maintenance of lamps. One meter will be provided to a block of houses to check consumption.

Croydon.—New Boilers, &c.—The Electricity Committee has had under consideration a report of the electrical mittee has not under consideration a report of the electrical engineer upon the boiler plant at the works, and recommends the disposal of two of the five remaining obsolete boilers, and the installation of one of a normal capacity of 35,000 lb. of steam per hour, a mechanical stoker, superheater, economiser and chimney. This will effect a saving of about £600 a year.

The electricity department has allowed the Lighting Committee

This will effect a saving of about £600 a year.

The electricity department has allowed the Lighting Committee £615 in respect of lamps not lighted during the past quarter. Owing to the serious depletion of the engineering staff at the works, it has been decided not to make any allowances to any further members of this section of the staff who enlist without first obtaining sensition first obtaining sanction.

Cuckfield.—Prov. Order.—At a meeting of R.D.C. on February 26th, it was reported that the B. of T. had written, stating that after careful consideration it had decided to defer the question of revoking the prov. order of the Mid-Sussex E.L. Co. for a year.

**Dover.**—Proposed Loan.—A loan of £6,000 for the provision of additional plant at the electricity works is recommended by the Electricity Committee.

Dublin.—The Corporation has adjourned for a month, pending the year's estimates being submitted, the proposal to increase the electricity rates owing to the increased cost of coal. It was stated that the consumers numbered this year 7,055. The number of units sold to private consumers had increased to 8,300,000. The income for the year was £97,000. The city treasurer estimated that this year the Corporation would have to pay in capital charges £53,650.

Dundee.—PUMPING PLANT.—The Corporation Electricity Committee is to put down a new pumping station in the neighbourhood of the Eastern Wharf, for the Carolina Port generating station.

East and West Ardsley.—Upon a report by the E.L. Committee as to the carrying out of the E.L. order, the U.D.C. has decided to ascertain the cost of having the order varied by the B. of T.

Eccles.—The Corporation has decided to discontinue the supply of electricity by prepayment meters to Copporation dwellings. In lieu thereof tenants are to be offered a supply either on the flat rate of 4d. in force, or a charge at the rate of 6d. per lamp

-Prov. Order.—The Gas and Electricity Co., which is applying for a prov. order for electric supply, has asked the B. of T. to dispense with the consent of the U.D.C. to the application. The U.D.C. has decided to reply that the Gas Co. under the proposed order was not compelled to supply current in the whole of the district; that the compulsory area did not include Cambridge Road, one of the principal residential thoroughfares in the town; and that the Council objected to both kinds of lighting being in the hands of one company.

STREET LIGHTING.—The R.D.C. is Enniskillen.applying for powers to enable it to enter into an arrangement with the Tempo Electric Supply Co., Ltd., for the lighting of the streets of Tempo with electricity.

Finchley.—A new oil engine, similar to that erected in 1913, is to be installed at the electricity works.

Frinton-on-Sea.—The Frinton and District E.L. Co., as the result of an appeal, has secured a reduction in rateable value from £280 to £120.

Glasgow.--Arc Lighting; Electric Cranes.-Owing to the shortage and high price of carbons for the ordinary arc lamps in use at Glasgow Harbour, the Clyde Navigation Trustees have approved of the gradual substitution of flame arc lamps in place of those now in use, as supplies of carbon for these could be obtained without difficulty. It is not intended to deal with Rothesay Dock at present, the arc lamps there being modern

The Trustees have also approved of a scheme for the gradual replacement of the four hydraulic cranes and the steam crane at the coaling quay in Queen's Dock, by three electric cranes. The first, which is a 32-ton electric, is expected to be in use about June. Arrangements are to be made to procure a second electric crane, and, for the third crane, to remove the present 25-ton steam grane, and to procure a number of electric capstans, and a set of electrically-driven pumps for the swing bridge, all at an estimated additional cost of £20,000, which would be spread over the next two or three

The T.C.'s lighting department has installed as an experiment number of 3,000-c.p. flame arc lamps in points in the busier thorough fares.

Gloucester.—The Electricity and Light Railways Committee reports that the output in the electricity department for January was 156,606 units, an increase of 2,300 units as compared with the corresponding month last year. For the Light Railway section the output was 43,193 units, an increase of over 2,000

Gortin (Co. Tyrone).—E.L. SCHEME.—An electric lighting scheme for the village is being considered, the motive power to be supplied by the Creamery or from the river. A Committee has been formed, and the shareholders of the Creamery are to be approached in the matter.

Grimsby.—Proposed Loans.—The Public Lighting Committee is again recommending the T.C. to approve the proposed battery scheme at the electricity works, and to apply for sanction to borrow £11,000 made up as follows:—Peak load battery, £5,000; prospective expenditure on mains, £4,000; prospective expenditure on services, £2,000.

Halifax.—Proposed Loan.—The Tramways Committee has decided to make application to the L.G.B. for sanction to the borrowing by the Corporation of the sum of £5,000, for prospective expenditure on new electricity mains.

Heston and Isleworth.—The contractors have informed the Electricity Committee that as the colliery from which the coal was drawn had restricted its output, the firm could not give more than 60 per cent. of the quantity contracted for. Under the circumstances, the contractors have been advised that unless coal is delivered to the extent guaranteed in the contract, the Council would buy against them. At the time of writing 200 tons had been ordered from another firm.

Heywood.—RESTRICTED LIGHTING.—All lights are to be lowered from one hour after sunset to one hour before sunrise as from March 1st.

Hull.—PLANT EXTENSIONS.—The Electricity Committee has approved of a scheme of plant extension at an estimated cost of £41,500. The scheme provides for the installation of two new boilers, a new turbine of a capacity of 5,000 kw., coal-handling apparatus, water-cooling system, &c.

Kingston-on-Thames! — Proposed Loans. — The Lighting Committee proposes to borrow £16,792 for the purposes of the electricity undertaking, viz., £5,792 in respect of excess expenditure on loans already sanctioned, and £11,000 to meet the estimated requirements for the next four years.

Kingstown.—Mr. Justice Barton, in the Irish Chancery Division, has made an order of the Court the submission and award of Mr. S. L. Brown, K.C., in the matter of the arbitration between the Dublin Southern District Electric Supply Co., Ltd., and the Kingstown Urban Council as to terms of payment for the undertaking; and costs of the company were referred for taxation. The sum of £3,608 is payable to the Electric Supply Co. under the award, as mentioned in our last issue

Leeds.—Proposed Loans.—The Corporation Finance and Parliamentary Committee recommends to the City Council to apply to the L.G.B. for sanction to borrow £25,000 for a new 6,000 kw. turbo-alternator, with accessories, and £8,700 for a 3,000-kw. turbo-alternator for Crown Point power station. An expenditure of £242,000 is estimated for by the City Tramways and Electricity Committee on electricity undertakings, and it is recommended that application be made to the L.G.B. for sanction to borrow £150,000 for mains extensions and £30,000 for the building and equipment of transformer sub-stations. The Tramways and Electricity Committee estimates the expenditure on tramways capital account for the next financial year at £93,291.

Leyton.-Linking-up Proposals.-The Electric Lighting Committee has under consideration an inquiry from the Hackney B.C. as to whether the District Council would be prepared to consider linking up its works to those of the B.C., so as to take a standby or bulk supply as an alternative to laying down further plant.

Liverpool,—STREET LIGHTING.—Mr. A. G. Smith, the lighting engineer of the city, in his report, states that the lighting by metallic-filament lamps along the whole of the New Broad Green tram-route, as far as the city boundary, is now proceeding, 43 50-C P. lamps having been fixed on side tramway-poles. Of the 501% miles of roads lighted at the end of the year, 8% were lighted by electricity.

London.—Poplar.—Application is to be made to the L.C.C. for sanction to a loan of £10,188 in respect of the electricity undertaking. The Electricity Committee reports the necessity of erecting an additional sub-station at Blackwall to meet increasing demands; meanwhile the engineer suggests the provision, temporarily, of a further 1,000 kW. converter at the generating station for next winter's load. The estimated cost, with temporary foundations and machine convections are weighted. generating station for next winter's load. The estimated cost, with temporary foundations, and machine connections, new switch-gear, and rearrangements of switchboard, is £3,350. It is also proposed that a 1,000-kw. converter be installed in the northern sub-station to compete with increased demands in this area, at a similar cost to that proposed for the main station. In connection with this extension it will be necessary to lay two low-tension feeders, and extend the existing feeder in Dace Road, at an estimated cost of £3,688.

BETHNAL GREEN.—The Electricity Committee of the B.C. has approved the following scale of charges for electricity.

cost of £3,688.

BETHNAL GREEN.—The Electricity Committee of the B.O. has approved the following scale of charges for electricity. For lighting purposes:—A (1) Minimum guarantee per half-year, as per Clause 9; (2) rate per unit for 30 hours' use of the maximum demand, per month, 8d.; (3) rate per unit for all further consumption in each month, 1d. B (1) £12; (2) 7d.; (3) 1d. C (1) £60; (2) 6d.; (3) 1d. For power, heating, cooking, and all purpurposes other than lighting:—D (1) As per Clause 9; (2) 3½d.; (3) ½d. E (1) £60; (2) 3d.; (3) ½d. For restricted supplies:—F (1) £3; (2) and (3) 1d. for all consumption.

L.C.C.—The Finance Committee recommends the Council's sanction to the borrowing of the following loans:—£15,000 by the Stepney B C. for mains, and £500 by the Islington B.C. in respect of the additional cost of cooling towers owing to the effect of war conditions upon the price of materials, especially timber.

STEPNEY.—The B.C. is recommended to apply to the L.C.C. for a loan of £35,000 for the electricity undertaking.

ST. MARYLEBONE.—The Electricity Committee recommends that the present domestic tariff be revised, and that an annual charge (the same as existing) plus ¾d. per unit for current and hire of apparatus be made, subject to the consumer entering into a satisfactory agreement specifying a minimum consumption.

ST. PANCRAS.—The Electricity Committee recommends that the offer of the Ecclesiastical Commissioners to advance £22,530 on loan for boilers for the electricity undertaking be accepted. The B.C. has agreed to give a supply up to 1,000 kW, to the L.C.C.

loan for boilers for the electricity undertaking be accepted. The B.C. has agreed to give a supply up to 1,000 kw. to the L.C.C. Arlington Road sub-station during the ensuing summer at \(\frac{3}{4}\)d. per unit, subject to variation according to the cost of coal.

London Electricity Supply Bill.—The Parliamentary Committee of the Middlesex C.C. proposes to obtain expert advice as to how the proposals in the Bill will affect the county, and generally as to the present electricity supply of the County of Middlesex, and how it could best be organised with advantage.

Macclesfield.—School Lighting.—The Electricity Co. has informed the Borough Education Committee that the directors had agreed to lay a cable to the school clinic free of charge, and without any obligation on the Committee's part as to guaranteed consumption of current, provided that the whole of the premises were wired, and electricity used exclusively as an illuminant. The Committee has replied that it is prepared to wire the premises, but cannot agree to the exclusive use of electricity.

Maidstone.—Proposed Loan.—The T.C. has applied for a loan of £7,450 for the provision of a 1,250-kw. turbo-alternator, foundations and girders, pipework, &c.

Manchester.—Loan Sanction.—The Corporation has received sanction to borrow £20,000, repayable within 15 years, for the purposes of the electricity undertaking.

Newcastle West (Ireland).—The electric lighting scheme has been inaugurated, and is now available for the public light of the town. The scheme was carried out by Mr. W. Phelan, and a few nights ago St. Ita's Hall in the town was lighted up for the first time with electric light.

Pembroke (Dublin). -- INCREASED CHARGES .-U.D.C. is recommended to increase the charge for energy for lighting and heating from 4½d, per unit plus 5 per cent, to 5½d, per unit, and for power from 1½d, to 2d, per unit, consumers of more than 25,000 units to be charged 1¼d, per unit.

-Questions as to whether the Diesel oil engines were satisfactory were asked at a meeting of the T.C. last week. Replying, the Mayor said he considered them a good investment; about three or four years ago the coal consumption at the electricity works was not much less than 1,500 tons. It was estimated that they would probably require 425 tons this year.

Stockton Heath.—Prov. ORDER.-The R.D.C. has received from the B. of T. a communication relative to a request from the Warrington Corporation that in view of the objections in connection with its application for a provisional order to include in its electric lighting area certain districts in the rural district, the Council's consent be dispensed with. A meeting is to be held shortly to discuss the matter.

Stoke-on-Trent.—ELECTRO-CHEMICAL SUPPLY.— B.C. has decided on the recommendations of the Electricity Com-

B.C. has decided on the recommendations of the Electricity Committee to give a supply of electrical energy for electro-chemical purposes to Messrs. Keeling & Walker, commencing with 3,000 units per week, taken continuously over 132 hours weekly, at extra-high-pressure three-phase, at a flat rate of  $\frac{1}{2}$ d. per unit, subject to an agreement being entered into. It is understood that while one furnace will be started initially, three are to be in use in a year, and the factory is designed for 12 furnaces.

The electrical engineer reports for the six months from April to September, 1914, that the total works costs were £9,614, as compared with £11,152, a reduction of £1,538 in generating costs. The revenue was £22,119, as compared with £21,024, an increase of £1,095. The number of units sold was 3,122,220, as against 2,993,969; cost per unit generated '511d., as against '707d.; cost per unit sold '739d., as against '894d. Coal per unit sold 5'50 lb., as against 7'79 lb. It was decided to request the B. of T. to approve a system of supply for all extensions where new A.C. mains approve a system of supply for all extensions where new A.C. mains are laid from the power house, at 415 volts per phase for power, and with 240 volts between each phase and neutral for lighting.

Thurmaston.—E.L. SCHEME.—The U.D.C. has decided to obtain expert advice as to the probable cost of an E.L. installation for the town.

Warrington.—RATE RELIEF.—It is proposed to contribute £1,000 from the electricity undertaking and £2,000 from the tramway undertaking towards the relief of the rates.

### TRAMWAY and RAILWAY NOTES.

Blackburn.—The local Society of Tramway Workers has made an application for an all-round increase of 1d. per hour in wages to meet the additional expense incurred through the higher cost of living.

Bolton.—Owing to the increased cost of living consequent upon the war, the workers in the tramway and other departments of the Corporation have applied for an increase of wages. The tramwaymen asked for 1d. per hour rise, and the matter has been referred to the T.C.

Bury.—Lieut.-Col. Druitt, B. of T. Inspector, has passed the tramway extensions at Bury to Jericho and Walmersley, and the routes have now been opened for public use.

Continental. — ITALY.—Application has been made for a concession for the construction and working of an electric tramway between Turin, Sassi and Superga, the existing funi-cular railway between Sassi and Superga being inadequate to the traffic requirements of the localities named, and its concession, moreover, expiring on December 31st, 1916. SPAIN.—A concession has lately been granted for the construc-tion and working of an electric tramway between Ferrol and Santa Maried do New.

Maria de Nera.

Croydon,-New TRAMWAYS.-The T.C. has received the B. of T.'s sanction to a loan of £900 for the construction of a double line of tramway in Cherry Orohard Road. The total outlay will be £1,480, and the balance, representing the outstanding debt on works to be superseded, is to be paid out of the renewals fund.

Dublin.—Petrol-Electric Cars. — The Blessington Steam Tramway Co. has ordered two petrol-electric cars for the summer traffic.

Halifax.—Tramway Extensions.—A deputation from the Southowram U.D.C. reported to the Tramways Committee that it was not satisfied with the terms offered by the Committee for extending the existing tramway, and suggested that the guarantee should be £20 per annum for the first five years, £10 per annum for the second five years, and £5 per annum thereafter, provided that when the whole line paid from the centre of the town to the terminus, as extended, the liability of the U.D.C. for any further payments should cease. The Tramways Committee decided that it could not modify its previous decision on the

Ilford.--Electric Vehicle.—The Electricity Committee has decided to purchase a 4-ton electric battery road van, with automatic tipping gear. The van is for use between the railway siding and the works.

London.—The L.C.C. Finance Committee has decided that war allowances to tramway employés, estimated at £81.000, shall be charged to the tramways account; the Highways Committee reports that despite the improved tramway results this procedure will lead to a deficit on the year, which will further deplete the general reserve fund, which was drawn on to meet the loss on

last year's working.

At the last meeting of the Council a motion to refer back this decision, the contention being that such expenditure should be met

by a special vote, was lost.

Northampton.—It is estimated that the balance to the credit of the tramways undertaking for the year ending March 31st next will be £1,171.

North London Railway Electrification.—At the annual general meeting of the company, Lord Rathmore stated that there was every reason to hope that electric trains would be running between Broad Street and Richmond over the Hampstead Junction line by the end of the year; the anticipated completion of the electrification of the North London and North-Western local lines this spring had been hindered by the war.

North-Western Electrification.—At the general meeting of the company on February 26th the chairman stated that, including £249,716 advanced to the London Electric Railway Co. in connection with the Paddington—Queen's Park extension, the capital expenditure for the year had been £1,233,250, of which £527,752 was in connection with the Euston—Watford electrification. During the current year it is estimated that £1,800,000 will be spent, the greater part in connection with the new electric

railway.

The engineer's report mentioned that the new line between Queen's Park and Willesden was approaching completion. The new power station and repair shed at Stonebridge Park are well advanced and the six sub-station buildings nearly completed.

Southport.—In response to an application by the Tramways Committee for a reduction in the price of energy, the Electricity Committee has stated that alterations to be made at Crowlands will, no doubt, result in a saving of coal, and the Committee will be prepared to consider the application when the alterations are completed.

It is understood that the Corporation tramway workers are about to ask for an advance of 4s. per week in wages, to meet the

increased cost of living.

South-Western Railway Electrification.—The yearly report of this company states that the electrification of the company's suburban lines has made steady progress during the past year. The main power house at Wimbledon and the substations at other places are practically completed, and the machinery is being erected. Several of the new electric trains have been constructed and the remainder are being proceeded with. Good progress has also been made with the placing of conductor rails, the bonding of track rails and the laying of high-tension cables on the first section of the railway to be electrified, i.e., the lines from Waterloo to Kingston via Twickenham and via Malden. Capital expenditure during the year has included £153,303 on electrification of suburban lines and £169,221 on electric power stations. stations, &c.

Urnguay. — The Diario Oficial publishes a law authorising the Executive Power to make arrangements for the transfer to the State of the Ferrocarril y Tranvia del Norte. Within a year of the nationalisation of this system, the new directorate of the line will present to the Executive Power a scheme for the electrification and extension of the tramway, which undertaking must be completed within three years.—Board of Irade Gazette.

Warrenpoint.—Electrification Scheme.—A project is being promoted by a Belfast company to secure the interest of the directors in the Warrenpoint and Roskern Tramway Co., and to introduce an electrical system. The line had always been worked by horses. Quite recently it closed down.

### TELEGRAPH and TELEPHONE NOTES.

Illicit Wireless Apparatus.—At Newcastle-on-Tyne Police Court on the 2nd inst., R. H. Barnett, of 25, Dean Street, Newcastle, was charged with having in his possession, without written permission of the Postmaster-General, component parts of apparatus for sending and receiving messages by wireless tele-

apparatus for sending and receiving messages by wireless telegraphy. Defendant pleaded guilty.

It was shown in evidence that Barnett was a retail dealer, who had in his shop window, and exposed for sale, a wireless spark coil. The proceedings were taken at the express request of the military authorities, who desired that attention should be specially directed to the necessity for a person who had anything to do with wireless apparatus to have a licence. None of the parts had been sold since the war began.

The Court, although convinced of the bona fides of Barnett, fined

him £10 and costs.

Imperial Wireless Chain.--Whilst stating House of Commons that a considerable amount of work had been carried out in connection with the English and Egyptian stations, the Postmaster-General added that the question of proceeding further with the construction of the Imperial wireless chain was under consideration, in view of the altered situation arising from the war. - Times.

International Telegraphic Conference.—The Conference, which was to have been held at Paris this spring, has been

Telegrams in Code.—The Postmaster-General has authorised the use of Broomhall's Imperial Combination Code in communication with all South American countries except Brazil and Dutch and French Guians. This is in addition to the ABC (5th ed.), Scott's (10th ed.), Western Union, Lieber's, and Bentley's

### CONTRACTS OPEN and CLOSED.

OPEN.

Aberdare.—March 6th. U.D.C. Twelve months' supply of cables, meters, joint-boxes, &c., lamps, uniforms, tickets and other stores. See "Official Notices" February 5th.

Australia.—Brisbane.—March 10th. Motor-generator, power board, &c., for Postmaster-General. See "Official Notices" January 15th.

MELBOUENE,—March 16th. White Wheatstone receiving tape, for Postmaster-General. See "Official Notices" February 5th.

Belfast.-March 15th. Twelve months' supply of stores for the Tramways and Electricity Committees. See "Official Notices" February 19th.

Birkenhead.—March 9th. Corporation. Continuouscurrent meters and house-service fuse boxes. See "Official Notices" February 26th,

Burnley.—March 22nd. Electricians' work for the B. of G. Forms, &c., from Mr. J. S. Horn, Clerk, Union Offices.

Bury.-March 8th. Constructional steelwork in connection with the electricity generating station extension. Mr. J. Ainsworth Settle, Borough Engineer, Bank Street.

Dover.—March 9th. Electrical sundries and cables for year, for the Harbour Board. Mr. Martyn Mowll, Registrar, Castle Street.

Dundalk. - March 23rd. U.D.C. Twelve months' supply of stores for the Electricity Department. See "Official Notices" to-day.

Edmonton. — March 10th. Electric lamps for the B. of G. Mr. F. Shelton, Clerk, The Grange, White Hart Lane, Electric lamps for the Tottenham.

Grimsby.—March 8th. Corporation. Two years' supply of motor-type meters. See "Official Notices" February 26th.

Heston and Isleworth.—March 6th. U.D.C. Twelve months' supply of electrical stores. See "Official Notices" February 26th.

Hove. — March 26th. Corporation. One 500-KW. mixed-pressure steam turbine, complete with D.C. 230/285-volt generator and surface condensing plant; also a battery of 115 accumulators. See "Official Notices" to-day.

Ilford.—March 9th. U.D.C. Supply and delivery of electric coal-wagon. Mr. A. H. Shaw, Electricity Works.

-Telephone and electric lighting material, telephone wires and motor plant, for a firm at Palermo. Write to Secretary, British Chamber of Commerce for Italy, 1. Via Innocenzo, Frugoni, Genoa, quoting Board of Trade reference, No. 514.

Kirkcaldy.--March 22nd. Corporation. Twelve months' supply of brass castings, pitch, iron castings, &c., for the Electricity and Tramways Committee. Forms of tender from Mr. O. F. Francis, Burgh Electrical Engineer.

Liverpool.—March 12th. Electrical fittings for a year for the Select Vestry. Mr. G. W. Coster, Clerk, Brownlow Hill.

-L.C.C.—March 16th. Reconstruction of three London. miles of single-line tramway on the underground conduit system. Specifications, &c. (£5), from Chief Engineer, County Hall, Spring Gardens, S.W.

Gardens, S.W.

HORNSEY.—March 16th. Meters, cables and stores, &c., for the T.C. See "Official Notices" February 19th.

Bow.—March 9th. Electrical supplies, for the Managers of the Poplar and Stepney Sick Asylum District. Forms of tender from the Clerk, Devons Road, Bow, E.

WANDSWORTH.—March 15th. B. of G. One month's supply of electrical fittings, for the Wandsworth Union. Forms of tender from the Clerk, Union Offices, St. John's Hill, S.W.

ondonderry. - March 13th. Corporation. Engineroom stores, carbons, meters, bitumen, fuse-boxes. Forms of tender from the Electrical Engineer, Electricity Department.

Macclesfield.-March 10th. Cheshire County Asylum, Parkside. Electrical goods for one year. Mr. Wm. Tingay, Clerk.

Manchester. — March 9th. (a) One 250-KVA. transformer, and (b) E.H.T. and L.T. cables. Mr. F. E. Hughes, Secretary, Electricity Department.

March 10th. Three 8-wire balancers for the Electricity Com-ittee. Mr. F. E. Hughes, Secretary, Electricity Department, Town Hall.

Newport (Mon.).—March 15th. Uniform clothing for the Corporation Electricity and Tramways Department. Mr. N. J. Young, General Manager.

Pontypridd. — March 8th. U.D.C. Twelve months' stores for Electric Light and Tramways Department. See "Official Notices" February 19th.

Rochdale. - March 11th. Twelve months' supply of stores for Tramways Department. Mr. G. Webster, General Manager, Tramway Offices, Mellor Street.

Salford,—March 8th. Axles and wheels for 24 bogie cars. General Manager of tramways, 32, Blackfriars Street.

South Shields.—March 12th. Twelve months' supply of engine-room stores for the electricity works. Specification from Mr. H. S. Ellis, Borough Electrical Engineer.

Spain.—The Ministerio de la Gobernacion is inviting tenders for the construction of a telephone line between Barcelona and La Junquera, and one from Barcelona to Valencia.—Board of

Swindon.—March 13th. Corporation. Twelve or six months' stores for Electricity and Tramway Departments. See "Official Notices" February 19th.

Swinton and Pendlebury.—March 19th. Cables, joint-boxes, bitumen and joint-box compound. See "Official Notices" to-day.

Transvaal. -- Bethal. March 25th. Municipality. Supply and erection of generating and pumping plant and overhead electric distribution system. Specifications from the consulting engineer, Mr. H. Hancock. P.O. Box 62, Klerksdorp (deposited in the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the con £1 1s.).

Warrington.--March 9th. Electrical goods (German or Austrian barred) for the B. of G., for six months. Forms, &c., from Arthur Bottomley, Clerk, Bewsey Chamber.

March 16th. Motors, cables, and E.H.T. feeder panel, for the Electricity Department. See "Official Notices" to-day.

-March 16th. Corporation. Supply of stores for the Electric Light Department. See "Official Notices" to-day.

Wrexham.—March 17th. Meters, oils, coal, &c., for the Corporation Electricity Department, for a year. Borough Electrical Engineer, Willow Road.

### CLOSED.

Barrow.—The T.C. has placed an order for a 200-KVA. transformer with the British Westinghouse Co., at £125; this was the lowest of three tenders received. The T.C. has adopted the engineer's suggestion that wherever possible, existing contracts for oils and stores should be renewed for 12 months with the same contractors.

Bingley (Yorks).—The U.D.C. has placed a 12 months' contract for the sole supply of single and polyphase balanced load meters with the Electrical Apparatus Co., Ltd.

Birmingham.—The City Council is being asked to sanction the purchase of 2,000 tons of steel rails and fishplates from the Lorain Steel Co., of America.

Blackpool.—The Corporation has accepted the tender of the Davenport Engineering Co., for a new cooling tower at the electricity works.

Bolton.—The Electricity Committee has accepted the tender of the British Thomson-Houston Co., Ltd., for switchgear.

-The Building and Sites Committee has accepted the tender of Messrs. H. J. Cash & Co., at £2,400, for the electric installation at the new Technical Institute.

Croydon.—The T.C. has accepted the tender of Messrs. Babcock & Wilcox, Ltd., for the following plant at the electricity

Boiler, superheater, and economiser, £4,215; two chain-grate stokers, £920; motor-driven induced-draught plant with iron chimney, £795; indicating steam flow meter, £23.

Dewsbury.—The B. of G. has accepted the tender of Mr. F. Dutton, of Heckmondwike, for electric bell work at the Nurses' Home and Infirmary, at £27 17s. 6d.

Dover.—The Corporation Electricity Committee has accepted the tender of the British Thomson-Houston Co., Ltd., for a 1,000-kw. turbo-alternator set complete with exciter, condenser and pumps, at £4,725.

The Tramways Committee has given an order to Mesers. Dick, Kerr & Co. to supply 50 tons of rails and the necessary fishplates, at £8 15s. and £11 15s. per ton respectively.

Finchley.—The D.C. has decided, should circumstances render it necessary, to buy against the contractors for the supply of 500 tons of coal for the works over a period of three months. The firm, having delivered 93 tons of the quantity arranged, have written stating that they will be unable to deliver any further quantities in the immediate future, but will do so when circumstances permit.

Glasgow.—The Clyde Navigation Trustees have accepted the following tenders for equipment in connection with he new 32-ton electric orane at Queen's Dock:—Cables—Johnson & Phillips, £947; switchboard—Crompton & Co., Ltd., £111; coaling cradle—Sir William G. Armstrong, Whitworth & Co., Ltd., £650; and three weighbridges—W. & T. Avery, £540.

Horsham.--The U.D.C. has placed a contract for D.C. meters with the Electrical Apparatus Co., Ltd., for the year ending March, 1916.

Ilford.—The following tenders have been accepted by the Electricity Committee for supplies of coal for a period of three

E. Foster & Co.—1,000 tons Ibstock medium peas, 19s. 11d. per ton; 500 tons Ibstock D/S nuts, 17s. 5d. per ton; 500 tons ditto slack, 17s. 5d. per ton. Bradbury, 8on & Co., Ltd., Warwickshire (Tamworth).—D/S nuts, 50 tons per week, 21s. 1d. per ton.

-The tender of Messre. W. Rickard, Ltd., Leyton.has been accepted by the U.D.C. for a six months' supply of cable at basis prices, ranging from £32 11s. for 3/18 to £101 13s. for 7/14. The tender of the Oliver Arc Lamp, Ltd., has also been accepted for the supply of 22,000 pairs of "Oriflamme" carbons, at £5 7s. 6d. per 1,000 pairs, and 18,000 pairs of "Metro-flamme," at £5 15s. per 1,000 pairs.

The present contract for the supply of engine cils to the Electricity Department is to be extended for a further position of 18.

tricity Department is to be extended for a further period of 12

months upon the same terms.

London.—Bethnal Green. The B.C. is recommended to accept the tender of Messrs. Measures Bros., at £534, for iron and steel work at two sub-statious.

L.C.C.—It is stated that the tender of the British Westinghouse Electric and Manufacturing Co., Ltd., at £62,003, has been accepted for the supply of two 8,000-kw. turbo-generators at the electricity station at East Greenwich.

St. Panchas.—The B.C. Electricity Committee has received the following tenders for the supply of 250,000 pairs of open-type arc lamp carbons :

General Electric Co., Ltd. (recommended) ...
Wells Electrical Co. ...
Oliver Arc Lamp, Ltd. ...
Engineering and Arc Lamp, Ltd. ...
British Central Electric Co.
Wm. Gcipel & Co.
London Commercial Electrical Stores, Ltd. ...
The Electrical Supplies Co. £2,039 2,185 2,185 2,185 2,490 2,586

The engineer, in recommending the acceptance of the above tender, pointed out that the cost of a similar quantity of carbons at last year's price would only have been £871 15s.

ST. MARYLEBONE.—The Electricity Committee recommends the coeptance of the tender of Messrs. R. H. Towler, for the supply of a blow-down tank, at £87.

The Committee has accepted the tender of Messrs. T. Press & Co. for renovating the interior of Aybrook Street sub-station, at £34 10s., and of Messrs. Carter & Co. for retiling and renovating the rotary converter room, at £53.

STEPNEY.—The Electricity Committee has received the undermentioned tenders for the supply of 50 tons of moulded pitch:-

The Committee has accepted offers of 1,930 tons of coal for the Electricity Department at prices varying from 15s. 9d. to 21s. 6d. per

BERMONDSEY.—The Electricity Committee has had under consideration tenders for the supply of coal for the period ending June 30th next, but as the increase in price is very considerable, and having regard to the Government statement as to bringing down coal prices, the Committee does not consider it would be advisable to make a contract at the present time. It is therefore proposed to purchase 400 tons of Shipley peas from Messrs. Myers, Rose & Co., Ltd., at 22s, 3d, per ton.

Rose & Co., Ltd., at 22s. 3d. per ton.

The following tenders have been received by the London Education Committee for installing electric light at the Scawfell

Street School, Haggerston: -

Johnson, O'Sullivan & Co.

A. Hawkins & Sons.

Alpha Manufacturing Co.
Lund Bros. & Co.

T. N. Kingdon & Co.
G. Weston & Sons, Ltd. .. (recommended) £318 844 875

-The T.C. has accepted the tender of the Harris Patent Feed Water Filter, Ltd., for a water-softening plant for the refuse destructor, at £129.

Maidstone.—Subject to a loan being granted, the T.C. has accepted the tender of the Brush Electrical Engineering Co. Ltd., for a 1,250-kw. turbo-alternator of the Ljungstrom type, at £6.887.

Manchester.—The Electricity Committee has accepted the following tenders :-

J. Spencer, Ltd.—Low-pressure pipework and valves, Stuart Street Station. B. I. and Helsby Cables, Ltd., and W. T. Henley's Telegraph Works Co., Ltd.—Cables.

The Gas Committee has approved the Electric Construction Co. Ltd., as sub-contractors for dynamos required in connection with the construction of a retort house.

The Rivers Committee has accepted the tender of Messrs. Glenfield and Kennedy, Ltd., Kilmarnock, for electrically-operated rectangular channel penstocks.

The Tramways Committee has accepted the tender of the B.I. and Helsby Cables, Ltd., for tramway rail bonds, and that of Meesrs. Hadfield, Ltd., for steel portable track rails.

North Bierley.—Out of 32 tenders submitted for the supply of 800 lamps to the North Bierley Union Authorities, Bradford, that of Mr. H. Moss has been accepted.

Salford.—The Electricity Committee has accepted offers for the purchase of the undermentioned plant, to be displaced at the Electricity Station, Frederick Road:—

S. Openshaw.—Two reciprocating engine sets, £1,650.
T. Mitchell & Sons, Ltd.—Three continuous current motors, £105.

The tender of Mesers. G. Wragge, Ltd., has been accepted by the Committee, at £101 14s., for steel and glass partitions at the Elec-

Wolverhampton.—The Corporation has placed a contract for the whole of its requirements for A.C. meters with the Electrical Apparatus Co., Ltd., for a year.

### FORTHCOMING EVENTS.

Royal Institution of Great Britain.—Saturdays, March 6th and 13th 3 p.m. At Albemarie Street, W. Lectures III and IV on "Ro Researches on Atoms and Ions," by Sir J. J. Thomson, F.R.S.

Saiford Technical and Engineering Association.—Saturday, March 6th, At 7 p.m. At Royal Technical Institute, Peel Park. Paper on "The Strength of Iron Castings," by Mr. E. L. Rhead.

Association of Engineers-in-Charge.—Saturday, March 6th. At 7.30 p m. At 8t. Bride's Institute, Bride Lane, E.C. Debate on "How to Pay for the War," a scheme proposed by the British Engineers' Association.

Wednesday, March 10th. At 8 p.m. Paper on "Modern Steam Laundry Machinery, more Particularly as Applied to Institution Work," by Mr. B. P. Flockton.

Institution of Mechanical Engineers (Graduates' Association),—Mon March 8th. At 8 p.m. Paper on "Propelling Machinery for Ships, Mr. W. J. Drammond.

Institution of Civil Engineers.—Tuesday, March 9th. At 8 p m. At Great George Street, S.W. Paper on "The Improvement of the River Clyde and Harbour of Glasgow, 1873-1914," by Sir T. Mason.

Wireless Society of London.—Tuesday, March 9th. At 8 p.m. At Institution of Electrical Fingineers, Victoria Embankment, W.C. Lecture on "Waves," by Dr. Erskine-Murray.

Royal Society of Arts.—Wednesday, March 10th. At 8 p.m. At John Street, Adelphi, W.C. Paper on "Patent Law Reform and the War," by Mr. J. W. Gordon.

Institution of Electrical Engineers.—Thursday, March 11th. At 8 p.m. At Victoria Embankment, W.C. Paper on "Electric Cooking, mainly from the Consumers' Point of View," by Mr. W. R. Cooper.

(Yorkshire Local Section).—Wednesday, March 10th. At 7 p.m. At Philosophical Hell, Leeds. Paper as above, by Mr. W. R. Cooper.

(Manchester Local Section).—Tuesday, March 9th. At 7.80 p.m. At Engineers' Club, 17, Albert Square. Paper on "Electricity Applied to Mining," by Mr. C. P. Sparks.

(Scottish Local Section).—Tuesday, March 9th. At 8 p.m. At Princes Street Estation Hotel, Edinburgh. Paper on "Automatic Protective Switchgear for Alternating Current Systems," by Mr. E. B. Wedmore.

Institute of Marine Engineers. — Friday, March 12th. At 8 p.m. At Tower Hill, Minories. Annual Meeting.

Physical Society of London.—Friday, March 12th. At 8 p.m. At Imperial College of Science, South Renaington. Papers on "The Estimation of High Temperatures by the Method of Colour Identity," by Messrs. C. C. Paterson and B. P. Dudding; "The Unit of Candle-power in White Light," by Messrs. C. C. Paterson and B. P. Dudding; and "The Relative Losses in Dielectrics in Equivalent Electric Fields, Steady and Alternating (R.M.S.)," by Mr. G. L. Addenbrooks.

South-Western Polytechnic Institute.—Friday, March 12th. At 8 p.m., At Manresa Road, Chelsea, S.W. Presentation of Prizes and Certificates by Mrs. Hayes Fisher.

Greenock Electrical Society.—Saturday, March 18th. Visit Messrs, Mayor and Coulson's Works, Glasgow.

#### NOTES.

Patents and Alien Enemies.—Mr. C. E. Lugard has been granted licences by the Board of Trade in respect of Patents Nos. 13,067-8-9, of 1906 (Schuster and another).

Educational Notes.—In connection with classes held Educational Notes.—In connection with classes held at 23, Great Quebec Street, Marylebone, W., Mr. K. H. Bird, M.A., now undertakes the preparation of candidates for science and engineering degrees (external students) of the University of London; entrance to the City and Guilds Engineering College, the Finsbury Technical College, &c.; Graduation and Associate Membership of the Institutions of Civil, Mechanical, and Electrical Engineers; factory inspectorships, &c. The engineering department has been organised and is carried on under the personal direction of Mr. G. W. de Tunzelmann, B.Sc., M.I.E.E., consulting engineer, formerly Professor of Physics at the Royal Naval College, Dartmouth, who, as many of our readers will remember, organised, and for some years conducted, one of the best known private

Dartmouth, who, as many of our readers will remember, organised, and for some years conducted, one of the best known private engineering schools in England, and is a recognised authority on the education and training of engineering students.

The Ponder's End works of the Edison & Swan United Electric Light Co., Ltd., Middlesex, were visited on Wednesday, the 24th ult., by the members of the Chemical Society of the Royal College of Science, South Kensington, Mr. E. W. Swann, their excursion secretary, being responsible for the arrangements. An interesting tour was made through all the lamp manufacturing departments. tour was made through all the lamp manufacturing departments, including carbon and drawn-wire sections.

Public Lighting in War Time.—The Illuminating Engineer states that a Committee of the Illuminating Engineering Engineer states that a Committee of the Illuminating Engineering Society, formed to consider the framing of recommendations on shop-window lighting, so as to enable merchants to comply with the requirements of the authorities, and at the same time to get the best illumination possible in the present circumstances, has prepared a series of recommendations which have been approved by the Council and submitted to the authorities. The Committee has invited the co-operation of several representatives of the Joint Committee formed to prepare the draft standard specification of street lighting, in order to consider what steps can be taken to make a similar study of the "scientific darkening" of the streets.

Trade Statistics of the United States.— –An American report just issued quotes some interesting preliminary figures showing the course of trade of the United States during the year 1914. Imports in that year showed a slight decrease as compared with those in 1913, and there was a decrease of about £75,000,000 in exports, the figures for 1914 being roughly £414,000,000, as compared with £489,000,000. While the European war has undoubtedly had a considerable share in causing this reduction, other factors have not been without influence. The largest decreases are to be found in the headings raw materials for manufacturing and manufactures ready for consumption. The following facturing and manufactures ready for consumption. The following statement of the imports and exports from and to belligerent countries are of interest :-

		ts from.	Exp	Exports to.			
	1913. Dollars.	1914. Dollars.	1913. Dollars.	1914. Dollars.			
United Kingdom	271,954,987	278,391,143	590,732,398	599,812,295			
France	138,933,833	104,215,131	153,922,526	170.104.041			
Belgium	41,458,376	30,362,019	64,317,469	34,771,023			
Ruseia		12,306,334		22,260,062			
Japan		105,696 252		41,750,979			
Germany	184,211,352	149,389,366	351,930.541	158 294,986			
Austria-Hungary	19,083,392	15,683,880	22,244,599	12,801,195			

The effect of the control of trade routes is clearly shown in these figures, but it is a noticeable fact that the exports from America to Italy showed an increase of about 30 per cent., a circumstance from which it is not difficult to draw an inference. Incorporated Municipal Electrical Association.—
The President of the I.M.E.A., Major H. Richardson, having been called up for Service on the outbreak of the war, and being unable, therefore, to discharge for the present the duties of his office, the Council appointed the senior vice-president, Mr. A. C. Cramb, as acting-president during Major Richardson's absence. Later, when it became necessary to consider the question of the 1915 Convention which was to have been held in Dundee, the president expressed a wish that only the necessary business of the Association should be carried on at present, and that the usual Convention should not be held this summer. The Council, after due consideration, decided that instead of the proposed Convention in 1915 in Dundee, business meetings should be held in London for the transaction of routine business necessitated by the articles of association and for the discussion of matters of general interest to the members. Incorporated Municipal Electrical Association. –

The following is the preliminary outline programme of the arrangements, which (other than dates) are subject to variation.

The meetings will be held at the Institution of Electrical Engineers. Victoria Embankment, W.C., by courtesy of the Council of the Institution, and will be restricted to members and official delegates.

THURSDAY, JUNE 17TH.

a.m.—To receive and discuss a report prepared by Mr. A. S. Blackman (chief electrical engineer, Sunderland), and Mr. T. Roles (chief electrical engineer, Bradford), on behalf of the "Point Five" Association, on "The Practical Result of the Point Five Tariff."

2.30 p.m.—To receive and discuss a report prepared by Mr. Frank Ayton (chief electrical engineer, Ipswich). hon. secretary of the Electric Vehicle Committee of the I.M.E.A. on "The Use of Electric Vehicles in Municipal Service."

The meeting will be followed by a parade and demonstration

of electric vehicles.

FRIDAY, JUNE 18TH.

m.—Annual general meeting. To receive the annual report and balance sheet; elect the officers and Council; and transact other business.

2.30 p.m.—If necessary the members will reassemble to complete

2.30 p.m.—If necessary the members will reassemble to complete any adjourned business.

The usual visitors' list will on this occasion be suspended; there will be no social functions, and it is not proposed to invite ladies. The headquarters of the Council will be the Hotel Cecil. The detailed official programme will be issued later. All communications relating to the business meetings should be sent to the secretary, at 28, Bedford Square, London, W.C.

### DEVELOPMENT COMMITTEE.

At the second and third meetings of the Development Committee, held at the Institution of Electrical Engineers, on January 15th and February 12th, 1915, respectively, the steps taken with regard to co-opting further members of this Committee were reported upon, and the complete list to date is as follows:-

Representing the I.M.E.A .-

Chairman, S. E. Fedden (Sheffield).

S. T. Allen (Wolverhampton). F. Ayton (Ipswich).
A. S. Blackman (Sunderland).
R. A. Chattock (Birmingham). A. C. Cramb (Croydon). Coun. Crowther (Sheffield),
J. E. Edgeome (Kingston).
Ald. Ellaway (Birmingham), F. M. Long (Norwich).

H. Richardson (Dundee). Ald. Pearson (Bristol). H. F. Proctor (Bristol). T. Roles (Bradford). A. H. Seabrook (Marylebone). Ald. J. Smith (Barrow). W. A. Vignoles (Grimsby).
G. Wilkinson (Harrogate).

Acting Hon. Sec., J. W. Beauchamp (West Ham).

Representing the A.M.E.E. (Greater London) .-

W. C. P. Tapper (Stepney).

Representing the B. E.A. M.A.

R. J. Ireland (British Thomson-Houston Co.).

G. Maurice (General Electric Co.).

H. C. Siddeley (Lancashire Dynamo Co.). D. N. Danlop (Sec. B.E.A.M.A.).

Representing Electrical Contractors' Association .- L. G. Tate (Secretary).

Representing Cable M
(W. T. Glover & Co., Ltd.)

Makers' Association.-L. B. Atkinson

Representing Association of Electrical Power Companies.—W. A. Chamen. A. de Turckheim (Secretary).

Representing British Electrical Federation.—W. L. Madgen.

Representing Society for Electrical Development, U.S.A. - F. W. Wilcox.

Sub-Committees were appointed to deal with the following matters

1. Publicity, to be operated from London district. Secretary, A. C. Cramb (Croydon).

2. Electrical Installations, to be operated from the Bradford district. Secretary, T. Roles (Bradford).
3. Domestic Appliances, to be operated from the Birmingham district. Secretary, S. T. Allen (Wolverhampton)

Further particulars in regard to the constitution of these Com-

Turner particular in regard to the constitution of these committees will be given when they are completed.

It was considered advisable to distribute the operations of these Committees over different districts of the country, in order to make it easier for persons who might, by reason of their experience or otherwise, be very useful, to attend the meetings.

It was also decided that Sub-Committees should have the power to co-opt persons, not necessarily members of the Development Committee or of the Incorporated Municipal Electrical Association, who, by reason of their experience in connection with different branches of the electrical industry, might be willing and able to give assistance in the work of the Sub-Committees.

A Rathenau Foundation.—It is announced that the Prussian Ministry has just given approval to the Emil Rathenau Foundation established by Herr Emil Rathenau in conjunction with the directorate and board of supervision of the A.E.G. The object of the Foundation is to place the Physical-Technical Reichsanstalt in the position of being able to promote enterprise in the department of electricity and magnetism by the acquisition and maintenance of distinguished workers and the grant of aid to its members and constant collaborators for undertaking journeys of investigation to similarly equipped institutions in Europe or in transmarine countries, together with the appropriate provision of costly instruments for which State funds cannot be rendered available. The Foundation has been established in honour of the costly instruments for which State funds cannot be rendered available. The Foundation has been established in honour of the creator of the A.E.G. on his 75th birthday. When it is mentioned that the assets of the Foundation merely consist of obligations or debentures in the A.E.G. for 100,000 marks (£5,000), it will be obvious that the promoters of the scheme have prepared a comprehensive programme for attempted realisation, although the real value of the obligations must have been much greater than the nominal value prior to the outbreak of the War. At the same time, further contributions are looked forward to, as an administrative council composed of the president of the curatorship of the Reichsanstalt. a member of the curatorship and the president of Reichsanstalt, a member of the curatorship and the president of the Anstalt has been appointed to decide upon the use to be made of the available means and of any future additions to the fund.

"Powerful Lights" Defined .- The Motor states that "a case was heard at Mortlake recently in which a member of the Automobile Association was summoned for driving with powerful lights. The case was particularly important because it was the first in which the police attempted to define the meaning of 'powerful lights.' The lamps complained of were electric side lamps of 6 C.P. each, and the police stated that the law officers of the Crown had given it as their view that any lamp showing a greater power than that of the ordinary oil lamp carried by taxicabs would be considered a 'powerful light' within the meaning of the Regulation now in force. This definition means that the side lamps, if electric, must be kept down to about 2 C.P. each in order to conform with the present requirements. Motorists must therefore reduce the power of their electric lamps either by using smaller candle-power bulbs or by adequately masking the glasses." "a case was heard at Mortlake recently in which a member of the

Manchester Tramway Employés' Society. -Manchester Tramway Employes' Society. — The Manchester Corporation Tramway Employés' Social and Athletic Society reports that during the past year the membership stood at 2,889, an increase of 300. Of the total members, 780 are now on active service. The society has furnished members in military training at Morecambe with football jerseys and knickers, and 100 packs of playing cards have been sent to soldiers at the Front. The income of the society last year amounted to £1,304, and the expenditure, including depreciation, to £1,196, leaving a profit of £108. of £108.

Golf.—At the annual meeting of the Aberdeen Electric Golf Club it was reported that the season so far as it went was satisfactory. The most important competitions, the Campbell Cup and the medal, had to be abandoned, as over 30 members were serving with the Colours. Mr. D. C. Campbell was re-elected captain, Mr. E. F. Stuart secretary and treasurer, and Mr. A. C. Duthie assistant secretary.

Ownership of Italian Water Power.—A curious dispute on the question of the ownership of the Lake of Gherla has arisen between the Società Varesina per Imprese Elettriche and the Domainal authorities. The latter granted to the former water rights in the Magorabbia torrent for the generation of electricity to work the Varese-Gherla-Luino Railway, but, on the ground that a portion of the waters of the Lake, claimed as Domainal property, fall into the torrent sought to imprese a rule limiting the intellea portion of the waters of the Lake, claimed as Domainal property, fall into the torrent, sought to impose a rule limiting the intake of water from both the torrent and the Lake. As the Varesina Society had already paid a private individual who claimed the Lake as private property, for the use of this water, the Domainal claim was resisted, and the matter brought before the Court at Varese, the Ministers of Finance and of Public Works being cited as witnesses. The local Court having dismissed the case on a point of form, the question has been referred to the Corte d'Appello for decision.

German Wireless. - Among the German war news received by Marconi wireless, —Among the German war news received by Marconi wireless, and published in the Times of Saturday last, was a paragraph stating that "the General Electric Co. of Belgium will subscribe five million marks to the new War Loan." There is obviously an error in translation here. The title is practically identical with that of the Belgian branch of the General Electric Co., Ltd., of London, which, of course, knows nothing about the matter—indeed that branch company only has a capital of £10,000. If there be any truth at all in the news, it must relate to one of the German electrical companies operating in Belgium. Belgium.

Institution and Lecture Notes.—Diesel Engine Association.—At the February meeting of this Asso-held at the Institution of Electrical Engineers, the Users' ciation held at the Institution of Electrical Engineers, the President (Mr. J. E. Edgeome) announced water particulars were being obtained in connection with the question of the use of Mexican fuel oil in Diesel engines, and in connection with specifications for fuel oil, and that both these subjects would be brought up for further discussion at a subsequent meeting. He also announced that at the next meeting the general question of insurance of Diesel engines against breakdown would be further disadvaged.

The discussion on the breakdown of a Carels Diesel engine at Oxford, which had been reported at a previous meeting, was resumed. Mr. F. H. Francis exhibited a bolt head from the connecting-rod big end of his engine at Oxford, and explained that this bolt was one which had failed at a previous breakdown in this bolt was one which had failed at a previous breakdown in May, and not at the breakdown now under discussion. He stated that both bolts were very similar, and that both were obtained from the Consolidated Diesel Engine Manufacturers, Ltd. The second bolt which broke had been tested by the Sheffield Testing Works, Ltd., and they had stated that it was made of good quality iron. Mr. Francis considered that steel would have been more suitable. He then produced a table of figures which he had worked out from particulars supplied to him by various Diesel engine users, and pointed out that Mr. Philip Smith's contention that the bolt was overstressed in the case of the Oxford engine appeared to be correct. It was interesting to note that in the case of the Carels engines at Chelses and Clacton, which are of the same size as the consists at Chelses and Clacton, which are of the same size as the Carels engine at Letchworth, the big-end bolts are 25 per cent. to 35 per cent. larger in area. Apparently in the case of the Chelses and Clacton engines the makers had rehammered out the big ends so as to take the largest bolt they could get in without altering the design of the big end.

Mr. Philip H. Smith, who had been invited to attend the meeting, gave data of relative stresses in big-end bolts in the case of engines of various makers. He contended that the bolts of the big end of the connecting-rod were of insufficient strength for their purpose, and that the absence of a proper radius under the head of the bolt and that the absence of a proper radius under the head of the bolt was a weak point in the design. In the course of the discussion which followed, he expressed the view that periodic annealing of the connecting-rod bolts was not to be recommended, but he considered that such bolts should not be stressed above 3,000 lb, per sq. in., and that they should be renewed every 12 months or so, or say, after about 3,000 hours' run. He added that in mentioning a definite period for the use of the connecting-rod bolts he was to express extent engled by information gives him by Discussion a great extent guided by information given him by Diesel engine

Mr. Everett gave some further particulars concerning the fracture of a gudgeon pin on his Carels engine at Clacton-on-Sea, and Mr. Smith expressed his opinion that this might have been due to the strain caused by a pre-ignition, which was known to have occurred on the engine on one occasion when the fuel cam was not in order.

Mr. H. L. Dixon, of Leatherhead, considered that without some further explanation it would not appear to be advisable that the bolts of the big end should be a tight fit, but that any shearing strain on the bolts should be taken by a spigot, to which Mr. Smith replied that, in his opinion, a tight fit for the bolts was preferable, but that he considered that a jaw-shaped connectingrod was the best arrangement.

The next meeting is to be held on Wednesday, March 17th, at the Institution of Electrical Engineers. Information and particulars concerning the Association can be obtained from the Acting Hon. Secretary, Mr. Percy Still, of 19, Cadogan Gardens, London, 8.W

Institution of Electrical Engineers.—At the meeting of the Newcastle Local Section on Monday (March 1st), and that of the Birmingham Local Section on Wednesday, Mr. C. P. Sparks read his representation on "Floateristic Applied to Mining" paper on "Electricity Applied to Mining.

Swedish Electrical Exports.—The exports of electrical machinery from Sweden last year only attained a value of £188,600, as contrasted with £254,250 in 1913. On the other hand, there was an increase in the exports of telephone material and apparatus—from £318,310 to £340,520.

Parliamentary.—Second Readings.—In the House of Lords on February 24th, the Aberdare U.D.C. (Tramways, &c.) Bill, and the Stalybridge, Hyde, Mossley, and Dukinfield Tramways and Electricity Board Bill were read a second time.

National Electrical Week.—It is proposed that the National Electrical Week to be organised by the Society for Electrical Development, Inc., of New York, shall take place early in the spring of 1916.

Appointments Vacant.—Shift engineer (37s.), for Dewsbury Corporation; switchboard attendant (30s.), for Stockport electricity department; plumber-jointer (40s.); two substation attendants (30s. each); are lamp trimmer, for borough of Wolverhampton; assistant electrician and fitter (£84), for Leicester Borough Mental Hospital; shaft engineer (42s. to 45s.), for Redditch U.D.C. See our advertisement pages to-day.

Inquiries. - Makers of the Arcazon arc lamps, suppliers of graphite and mangauese peroxide in large quantities, and makers of accessories and spare parts for use with the Santoni and Sunshine flame are lamps are asked for.

### OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—Mr. H. J. HAZELGROVE, draughteman, was presented with a pair of pictures, as a mark of esteem, by the staff of the Battersea Council's electricity department, on his leaving to take up a more lucrative position with the Sturtevant Engineering Co.

ME. H. H. PAETINGTON, of Falkirk, has been appointed as substations superintendent at the Salford electricity works, at a salary of \$200 per annum. This sum has been fixed as the minimum salary for future holders of this position.

ME. F. PAPE, of Barrow-in-Farness, has been appointed as shift engineer at Eccles (in place of Mr. Bedford, who has volunteered for military service)

for military service).

MR. GEORGE J. HOLLYER, A.M.I.E.E., has been promoted by the Walthamstow U.D.C. to the position of assistant electrical engineer. In this capacity he will have entire charge of all departments of the electricity undertaking during the absence of the chief engineer

MR. FRED. TYRRELL, assistant electrical engineer at the Ascot works, and formerly of Kingston-on-Thames, has received a similar

appointment at Lagos, Nigeria.

MR. FRED. DUCKWOETH has been appointed head clerk in the Haslingden Corporation electricity and tramways department.

MR. ALFRED L. LUNN, who for the past five years has been one of the charge engineers at the Corporation Works, Sunderland, has been appointed to a similar position under the Manchester Corporation, at the Stuart Street works. He began his new duties on Monday. Before going to Sunderland Mr. Lunn was at Manchester. The Sunderland electricity staff presented him with a case of fish servers and eaters. Mr. Wilfred Yorke, assistant engineer, made the presentation.

MR. F. P. EVANS, who has acted as mains and meter superin-

MR. F. P. EVANS, who has acted as mains and meter superintendent to the Urban Electric Supply Co., Ltd., Grantham, since December, 1907, severed his connection with the Grantham Works on February 24th. The staff presented him with a set of military hair brushes, a letter case and a fountain pen. He left Grantham to take up the position of chief assistant at Market Drawton. Drayton.

Under the present circumstances, the Ilford Electricity Committee has adjourned sine die the question of the salary of the electrical engineer.

Tramway Officials.—Croydon T.C. has increased the salary of Mr. Gordon Stanley, engineering assistant in the tramways department, from £160 to £185 per annum.

General.—Dr. Archibald Barr, Emeritus Professor of Civil Engineering and Mechanics at Glasgow University, has been honoured by professional bretheren and former students on the occasion of his recent retiral from the professional chair. At a largely-attended meeting in the Bute Hall of the University, one portrait of Dr. Barr was presented to the University and the other offered for Mrs. Barr's acceptance. Mr. J. S. Nicholson, lecturer on Electrical Engineering at Glasgow University, presided, and the presentations were made by Mr. Hugh Reid, LL.D., of the Hydepark Recomptive Works, Principal Sir Donald MacAlister accepting

park Mocomotive Works, Principal Sir Donald MacAlister scoepting on behalf of the University authorities.

MR. HUDSON, of Messrs. Hudson, Sheed & Towell, Ltd., has severed his connection with that firm, and has taken up his old position with Messrs. Fredk. Thomas & Co., 189, Drummond Street, N.W.

At last Monday's meeting of the members of the Royal Institution, a letter was read from the Hon. Sir C. A. Parsons, K.C.B., F.R.S., enclosing a cheque for \$5,000, which he said "might be of some help at the present time." The managers passed a resolution expressing their most grateful appreciation of Sir Charles's munificence and discernment in unconditionally placing the sum at ficence and discernment in unconditionally placing the sum at their disposal for the purposes of the Institution. The resolution read:—"They accept the gift as a timely and noble recognition of the good public work the Institution has done in the past, and is still doing, in the acquisition and diffusion of scientific knowledge, and as an incitement to maintain and extend its usefulness in the unique position which it has for more than a century occupied."

MR. WM. E. HEMINGWAY has been appointed by the Dewsbury

B. of G. as electrician to the workhouse.

The Erie Pump and Equipment Co., Erie, Pa., have appointed as sales engineer Mr. N. H. Brown, who was until recently Chicago

representative of the Bury Compressor Co.

We congratulate Mr. ALAN A. CAMPBELL SWINTON on being selected by the Council of the Royal Society for recommendation for election.

Obituary.—The official announcement of the Singapore riot of February 15th stated that MB. BELFIELD NORTH WOOLL-COMBE, who, with his wife, was killed, was an official of the Eastern Extension Telegraph Co. It is stated that MR. G. O. LAWSON, of the Singapore Volunteer Rifles, who was also killed, went out to Singapore as an electrical engineer about three

It is reported in a financial daily that Mr. Fred W. Lawson, of Leeds, a director of Fairbairn, Lawson, Coombe, Barbour & Co.,

died at Bath on February 24th.

The funeral took place at Blackamoor Church, Blackburn, on February 25th, of MB. ROBERT DUGDALE, of 431, Bolton Road, Ewood, an electrical installation contractor of Preston New Road.

Ewood, an electrical installation contractor of Freston New Rosse. Death was due to pneumonia.

MB. CHABLES HOLLIDAY, who has died at Crossgates, at the age of 69 years, was a former chief superintendent of telegraphs at Leeds Post Office, retiring in 1906, on reaching the age limit. He joined the Electric Telegraph Co. in 1860, and shortly afterwards became an operator with the United Kingdom Telegraph Co. In 1901 he was made superintendent in succession to the late Mr. E. Trenam.

### NEW COMPANIES REGISTERED.

Smith & Mortimer, Ltd. (139,485).—This company was registered on February 28th, with a capital of £1,000 in £1 shares (210 preferred "A," 30 preferred "B," and 760 ordinary), to carry on the business of electrical engineers, automobile and accessory manufacturers, engineers, counders, smiths, contractors and manufacturers and sellers of an improved combined magneto lighting and charging set for the use of motor-propelled vehicles invented by C. H. M. Smith, and to adopt an agreement between H. Mortimer, C. H. M. Smith, H. W. Mortimer and S. J. Mortimer. The subscribers (with one share each) are:—H. Mortimer, Shanhlin House, 41, Crescent Gardens, Bath, auctioneer; C. H. M. Smith, "South Brook," London Road, Bath, electrical engineer; H. W. Mortimer, 15, Crescent Gardens, Bath, accountant: S. J. Mortimer, Bhanklin House, 41, Creacent Gardens, Bath, accountant: S. J. Mortimer, Bhanklin House, 41, Creacent Gardens, Bath, automobile engineer, Private company. The number of directors is not to be less than two or more than four; the first are H. Mortimer, C. H. M. Smith, H. W. Mortimer and S. J. Mortimer (all permanent); qualification, £50; remuneration as fixed by the company. Solicitor, J. S. Carpenter, 2, Pierrepont Street, Bath.

Supresy Flectrical Co. Ltd. (139,160)—This company was

Surrey Electrical Co., Ltd. (139 460).—This company was registered on February 2ith, with a capital of £2,000 in 1,750 6 per cent. preference shares of £1 each, and 5,000 ordinary shares of 1s. each, to carry on the business of manufacturers and sellers of electrical appliances, lamps and electrical novelties, motor appliances, &c., and to adopt an agreement with F. R. Marks, E. Dance, A. T. Redgwell, F. Tammage and F. Coates. The subscribers (with one share each) are:-F. R. Marks, Sustex Lodge, Winbeldon Park Road, Wandsworth, S.W., merchant: J. D. Cassels, Spring Lodge, Southfields, S.W., barrister; E. Dance, 57, Geraldine Road, Wandsworth Common, S.W., traveller. Private company. The number of directors is not to be less than three or more than five; the first are F. R. Marks, J. D. Cassels, E. Dance and A. T. Redgwell; qualification, 250 ordinary shares. Registered office, 77, East Hill, Wandsworth, S.W.

East London Electric Co., Ltd. (139,431).—This company was registered on February 28rd, with a capital of £1,000 in £1 shares (500 6 per cent. cumulative preference), to carry on the business of electrical engineers and contractors, suppliers of electricity, manufacturers of and dealers in electric, magnetic and galvanic apparatus. &c. The subscribers are:—W. B. Allcock, March Green House, Dagenham, electrical engineer, one ordinary share; P. H. Dipple, 196, Barking Road, Canning Town, E. Elicensed vicualler, one preference share. Private company. W. B. Allcock is permanent governing director, with 20 per cent. of the net profits as remuneration. Solicitor: J. Hands, 97, Gresham Street, E.C.

Electrodes, Ltd. (139,422).—This company was registered on February 22rd, with a capital of £10,000 in £1 shares, to carry on the bustness of manufacturers of, and dealers in, apparatus and appliances for the production of light in reflectors and projectors, electricians, engineers, makers and suppliers of electricity. &c. The subscribers (with one share each are:—A. M. Billington, Suffolk House, Laurence Pountrey Hill, E.C., civil and electrical engineer; A. M. Hay, jun., Suffolk House, Laurence Pountrey Hill, E.C., civil and the subscribers of electrical engineer; and the subscribers of directors is not to be less than three or more than five; the first are A. M. Billington (permanent) and others to be appointed by the subscribers: qualification, £100. Registered office, Suffolk House, Laurence Pountney Hill, E.C.

Thard Wilson's Defaut Naiscalacs Wingh Co. Ltd. (139.421)

David Wilson's Patent Noiseless Winch Co., Ltd. (139,421).

—This company was registered on February 22nd, with a capital of £25,000 in £1 shares, to carry on the business indicated by the title, and that of electrical and mechanical engineers, manufacturers and reliers of machinery, and to adopt an agreement with D. Wilson. The subscribers (with one share sach) are:—D. Wilson, 18, Greenkeys Road, Lisoard, engineer; W. H. Pealing, 604, Tower Buildings, Liverpool, secretary. Private company. The number of directors is not to be less than two or more than seven; the subscribers are to appoint the first; renuneration as fixed by the company. Secretary, J. S. Haynes. Registered office, 38, Drury Buildings, Water Street, Liverpool.

### OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Suppliers' Construction Co., Ltd. (66.081).—Capital, £350,000 in £5 shares. Return dated December 31st, 1914. All shares taken up. £350,000 paid. Mortgages and charges: Nil.

Sun Electrical Co., Ltd. (63 261).—Capital, £45,400 in £1 shares (20,000 preference). Return dated December 29th, 1914. 17,141 preference and 5,400 ordinary shares taken up. £72,541 paid. Morkages and charges at date of return: £3 325, since registered; satisfaction to the extent of £775 on February 9th, 1915, of debenture stock dated March 3148, 1911, originally securing £7,000.

Electro-Mechanical Brake Co., Ltd.—A mortgage on land in Moor Street, West Bromwich, with the Eagle Foundry thereon, dated February 1st, 1915, to secure all moneys due or to become due from the company to the London City and Midand Bank, Ltd., 5, Threadneedle Street, E.C., not exceeding £7,500, has been registered.

Bishopsesstle Electric Light and Power Co., Ltd.—Particulars of £500 debs., created February 8th, 1915, filed pursuant to Bec. 93 (3) of the Companies' (Consolidation) Act, 1908, the amount of the present issue being £180. Property charged: The company's undertaking and property, present and future. No trustee.

Spensers, Ltd.—Issue on February 17th, 1915, of £850 second debs., part of a series of which particulars have already been filed.

Shipston Electrical Co., Ltd.—Particulars of £200 third debs., created February 20th, 1915, filed pursuant to Sec. 98 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and uture, including uncalled and unpaid capital. No trustees,

### CITY NOTES.

### Lancashire United Tramways, Ltd.

THE directors report that the result of the working of this and the operating companies comprised in this company's system, worked out as though they were one combined undertaking, is as follows for 1914: -Traffic receipts £85,144, miscellaneous receipts and electrical energy sold £5,889, = £91,033; less working expenses £52,786, cost of generating electrical energy sold £2,718, general charges (including direction, management, interest, etc.) £5,401, rent of leased lines £5,188, = £66,093, leaving £24,940, plus dividend on holding in the New St. Helens and District Tramways Co., Ltd. £1,534, making the profit of combined undertaking £26,474. The receipts, compared with those of the previous year, show an increase of £3,472, notwithstanding a decrease in traffic receipts of £1,889 since the outbreak of war. The receipts amounted to 8.91d. per car mile.

The increase in expenditure amounted to £4,651. This was due principally to the additional expenses occasioned by the working of the Little Hulton and Farnworth extensions and motor coaches, and to heavy cost of maintenance of permanent way, owing to the increased wear and tear of the track by heavy motor goods traffic. During the year the rates of pay to employes have been increased.

The company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the company is matter at the com

heavy motor goods traffic. During the year the rates of pay to employes have been increased.

The company is making allowances to the dependents of men who have joined the colours. Down to December last £230 had been granted.

Three motor coaches were purchased at the end of May, but the chassis were impressed by the military authorities early in September. They proved successful during the short period they were running. The profit amounted to £241, after writing off the loss on the sale of the vehicles. Orders have been placed for new chassis to enable this traffic to be resumed at the termination of the war.

The interest and dividends received by this company from the operating companies, together with sundry receipts, amounted to £14,438. After deducting interest on the prior lien debenture stock and expenses, there remains £138, which has been carried to depreciation account. There is also an undivided surplus on the year's working of the operating companies, after payment of the interest and dividends before mentioned, of £13,816. The depreciation and renewals accounts and amounts carried forward in the combined companies now amount to £38,744.

During the year 17 cars have been fitted with top covers, and the directors propose to cover a further number of cars this year.

Owing to the increased demand for power, a new agreement has been entered into with the Atherton Urban District Council for the supply of electrical energy for 20 years from January 1st, 1915.

The Hon. Arthur Stanley, M.P., presided over the annual meeting, held at Winchester House, E.C., on Friday last. He said that the profit of the combined undertaking for the year amounted to £26,474, as against £27,653 in 1913. The profit in 1913 was over £8,000 in advance of any previous year, and considering the abnormal conditions obtaining in the last few onsidering the abnormal conditions obtaining in the last few months the profit of the past year was a fairly satisfactory one. The increase in receipts was £3,472. Up to the end of July the traffic receipts showed steady weekly increases aggregating £5,000 for the seven months, but from the date of the outbreak of war there had been a considerable decrease in traffic. The running of the three motor coaches for three months resulted in a profit of £241. Those coaches had been commandeered by the Government, but their experience during the short time they were working confirmed their action in entering on this branch of passenger traffic, and they had therefore made arrangements to resume same as soon as possible after the war. The expenditure had increased by £4,651. The working of the Little Hulton and Farnworth extensions for a full year as against four months in 1913 accounted for £1,500 of this; higher rates of pay to workmen £800: and the maintenance of permanent way had gone up by £2,300. This was due to the great increase in wear and tear of track by motor goods lorries. The number of these vehicles now on the roads, and the certainty of further expansions in this traffic, had created a serious problem for those responsible for road maintenance. a serious problem for those responsible for road maintenance. Tramway authorities had discussed the matter at length, and in the near future it was hoped that some concerted action in the near future it was hoped that some concerted action would be taken to relieve those undertakings of the very enerous conditions which now obtained in connection with the maintenance of the highways. They had adhered to their practice of transferring from the operating companies just sufficient revenue to meet the interest on the prior lien debenture stock, consequently £13.816, representing the balance of profit of the combined undertaking for the year, had been retained by the operating companies, the greater portion having been placed to renewals account, and the remainder carried forward. The depreciation and renewals accounts and amounts carried forward in the combined companies now amounted to carried forward in the combined companies now amounted to £38,743. Owing to the increased demand by the Atherton Urban District Council for the supply of electrical energy, it had become necessary to make further additions to the generathad become necessary to make further additions to the generating plant, which they proposed to do this year. In consequence of this they had thought it advisable to enter into a new agreement with the Council, who had agreed to extend the period during which they would take a supply from them from ten to twenty years. Up to date 129 employes of the associated companies had joined the colours. In the cases of married men and single men with dependents they were supplementing the Government allowances, so that each family received not less than the average wages earned before enlistment.

Mr. J. S. Austen seconded the motion.

The report was adopted.

The report was adopted.

(Continued on page 329).

## THE ELECTRIC VEHICLE.

THE advantages of using the electric vehicle for municipal services in the initial stages of the electric vehicle movement in this country, have been pointed out on more than one occasion by ourselves and others. But municipal bodies are proverbially slow to move, and the difficulties of penetrating the charmed circle of municipal thought with a new

idea have perhaps been under-estimated, certainly so in those only too numerous cases where an apathetic chief engineer has not taken the trouble to investigate the claims of the "electric" and to enlighten the

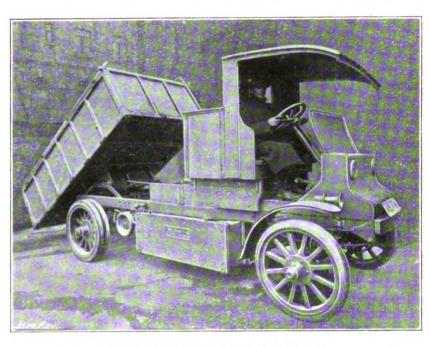

Council as to its possibilities.

A Corporation which owns both electric lighting and tramway undertakings, and yet cannot find a place for the electric battery vehicle amongst the road equipment of its various departments, cannot expect the inhabitants of the town to attach much weight to any arguments in its favour. An ounce of practice in a case of this sort is worth a ton of theory, and it is up to our municipal authorities to lead the way—as in fact they did when the more expensive but more efficient electric tramway superseded horse traction.

A few municipal authorities are now taking a really active interest in the electric vehicle; a number can also lay claim to be supporters of the Electric Vehicle Committee, which is a very different thing; while of the remainder we should not be surprised to hear that a considerable proportion had not perceived, even if they have heard of, the existence of the electric vehicle.

In justice to the Electric Vehicle Committee, we may add that it has always appealed to us as a shining example of unity of purpose, and we do not doubt that it has done yeoman service in bringing together the various interests dependent on the support accorded to it, and it seems pertinent at the moment to inquire just how far this is being given by our station ergineers.

It would be a thousand pities were the introduction of the electric vehicle to be hindered at the present time, when events—ill in other respects—have conspired to give

EDISON DUST-VAN, SHOWING BODY TIPPED.

it an advantage over the too easily requisitioned horse or petrol vehicle.

At the moment a good deal of interest is being taken in the electrically-propelled dust van, and trials of such a

vehicle have been carried out at Hounslow, Barnes, Wolverhampton, Birmingham, West Bromwich, Sheffield and Croydon, resalting in certain definite recommendations. For instance, Mr. G. Bruce Tomes, surveyor to the Barnes Urban District Council, has reported to his Council on the experimental use of electrically - propelled dust vans, which have proved very satisfactory and resulted in a recommendation for the purchase of four such vans.

We gather that the first van tried was supplied by Edison Accumulators, Ltd. The cost is stated to be £945 complete with chassis, battery and tipping body; the body is tipped by a small motor driven from the main battery, and only takes from

10 to 15 seconds to tip. The speed of the van is about 10 miles an hour, and it has a radius from 40 to 45 miles. During the time it was at work, careful tests were made

Recrea

2-TON EDISON BATTERY-DRIVEN DUST-VAN.

involved, and in ensuring some semblance of method in the initial stages of the movement.

The power of the Committee for good, however, is

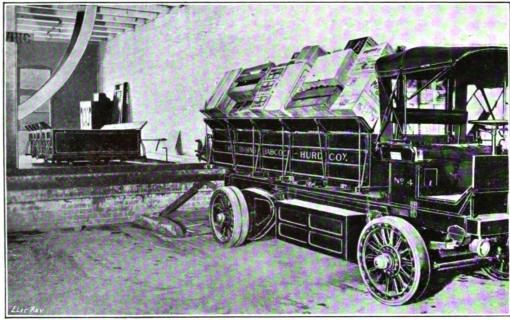

Digitized by Google

of the mileage, current consumed, &c., and the running cost per day, including interest and repayment on the loan, wages, current, tires, maintenance of battery and chassis, insurance,

£4,000, a saving of at least £400 per annum can be effected by the change of system.

> way by the number of cubic yards collected. A motor-van collects 28 loads per week, and four vans would collect

The comparison can also be made in a somewhat different

BAKER ELECTRIC THUCK, WITH DETACHABLE BODY.

and oil waste and sundries, &c., worked out at 19s. 4d. per day. This includes an allowance for charging apparatus.

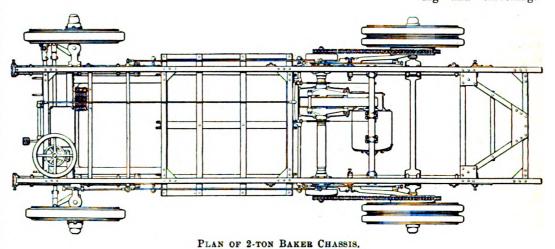

The second van was a Baker electric chassis supplied by the Wolseley Motor Co. The price of the chassis with battery is given as £660, and a body with hand-tipping gear would bring the cost up to £750. The speed is somewhat less, but the radius and running cost works out the same as in the former

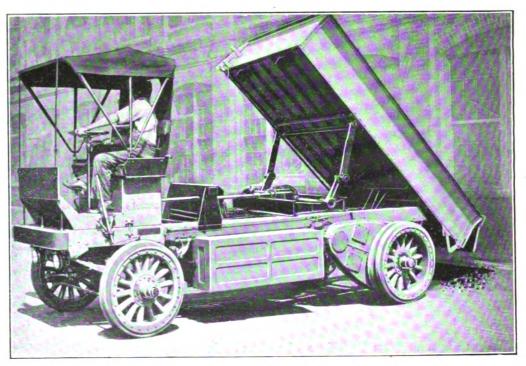

With regard to the work done, it was found that one van will take the place of 16 horses per week, and as the number of horses and carts required for dust removal averages 62 per week, four vans will do the work with a small margin to spare. On these lines the comparative cost would be as follows :-

62 horse-cart days, at

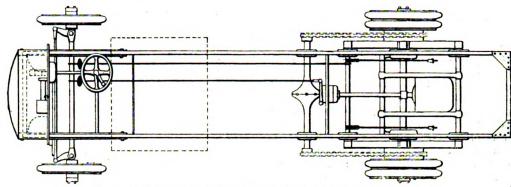

11s. = £34 2s. 24 dust-van days, at 19s. 4d. = £23 4s.; two extra fillers to replace one-fifth of time of 10 carmen employed in filling, each at 30s. = £3, making a total of £26 4s., which represents a saving per week of £7 183, and a saving per year £410 16s.

Notwithstanding a capital expenditure of 112 loads per week, which, at  $4\frac{1}{2}$  cb. yd. per load, would make 504 cb. yd. A horse and cart collects 21 loads per week, and at  $10\frac{1}{3}$  carts per day (the number now in use) would collect 217 cartloads, which at 21 cb. yd. each would make 488 cb. yd. Four motor-vans would therefore do the work with 16 cb. yd. to spare. The most striking point in the statistics is the great difference in the times occupied by the two classes of vehicles in "collecting" and "travelling."

BAKER ELECTRIC DUST-VAN, SHOWING BODY TIPPED.

PLAN OF EDISON 2-TON ELECTRIC CHASSIS, AS USED ON DUST-VAN.

The horse and cart spends  $2\frac{1}{4}$  hours per day collecting, and  $6\frac{1}{4}$  hours per day in travelling to the destructor and back again. The motor-van spends an average of 5 hr. 56 min. per day in collecting, and 2 hr. 34 min. per day travelling to and from the destructor, thus reversing altogether the time in which the vehicle is effectively employed in the collection of refuse.

Mr. Tomes arrives at the obvious conclusion that a change of system should be adopted, and motor-vehicles substituted for horse-drawn vehicles for the purpose of house-refuse removal.

The following tabulated data regarding the performance of the Edison van during the week's test may also be of interest:—

Average number of loads per day			5
Total number of loads per week			30

We understand that the Croydon Municipal Authorities are giving careful consideration to these results with a view to employing several 3-ton vehicles.

In the case of Sheffield, unofficial figures for a trial extending over a day and night show that during the day three experimental trips were made, 6 ton 3 cwt. being carried a distance of  $19\frac{1}{2}$  miles, on 22 units, while at night five similar trips were made between 11.30 p.m. and 6.20 a.m., the time occupied on each journey (out and home) being roughly one hour. Some 10 ton 14 cwt. was carried a

ELECTRIC HORSE AMBULANCE BY THE COMMERCIAL TRUCK Co., NEW YORK (see page 328).

Rather more detailed but unofficial figures regarding another week's test of the same Edison van at Croydon are as follows:—

Total mileage			163
Average mileage per day	•••	•••	27
Total loads collected	•••	•••	32
Average loads collected per day	•••		2.3

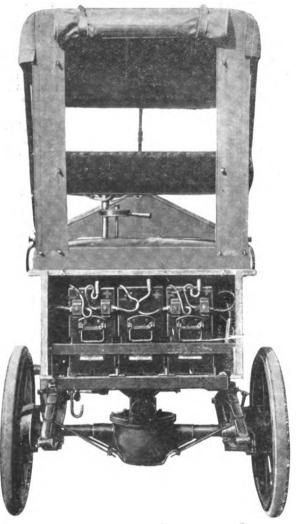

distance of  $10\frac{1}{2}$  miles on 12 units. The standard 2-ton Edison tipping van, to which reference has been made, is equipped with 60 A-8 type Edison cells, for operating a single enclosed type motor (72 volts, 40 amp., 900 R.P.M.), which has a flexible shaft drive on to a differential counter shaft, and roller chain drives connecting each end of the latter to sprockets on the rear wheels.

The flexible shaft drive is a feature of the vehicle, the shaft consisting of a flat spring tempered-steel blade, which is self-aligning and exercises a cushioning action which tends to save the vehicle from undue stress while at work and increases its efficiency.

The accumulator can be housed in a compartment below the driver's seat and on the top of the chassis, this position having advantages in the matter of accessibility under some

conditions and offering good protection to the battery.

The controller is of the continuous-torque drum type, giving five forward and two reverse speed positions with a positive stop between forward and reverse; it is placed under a hood in front of the dash where it is accessible for Ball and roller bearings are fitted to the wheels, motor, differential, &c. The vehicle is provided with a safety switch operated by a driver's key, also with a

REAR VIEW, VOLTACAR 5-CWT. VAN, SHOWING BATTERY (see page 329).

Sangamo ampere-hour meter, reading the input to the battery when charging, thus giving a ready check on bills

for power.

The rated travel of the vehicle on one charge is 40 miles fully loaded and the speed under good conditions, 11 to 12 miles an hour. The dust-van is fitted with a sheet-steel body provided with automatic tipping gear. This is an electrically operated device put into action by a simple reversing switch. A small electric motor gives the body a direct thrust backwards through the medium of a reduction

gear and square threaded screw of ample proportion.

The body is provided with rollers, which run on a steel runner path of special profile, such that when the body is pushed backwards, a tilting motion is also given to it. This arrangement possesses the advantage that the bodywork is stable in all positions, whilst the centre of gravity travels almost horizontally; thus the amount of energy used for tipping, and the time taken for the process, are greatly reduced as compared with other mechanical methods in use for effecting this action.

We are able to illustrate, on page 326, a Baker electrical tipping van of the type tried at Barnes. This vehicle is equipped with 42 Exide ironclad cells carried in a cradle slung under the chassis frame. A single series-wound motor is fitted and drives through a Renold silent chain to the counter shaft, while two roller chains couple the latter to the rear

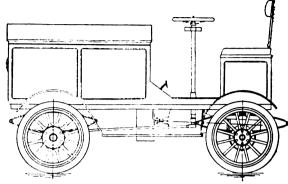

DIAGRAM OF THE VOLTACAR DELIVERY VAN (see page 329).

wheels. Timken roller bearings are fitted in the front and rear wheels, and roller bearings on the motor and counter shaft. The working mileage per charge is about 40.

### AN ELECTRIC MOTOR AMBULANCE FOR HORSES.

Notwithstanding the great increase in the use of automobiles, it is estimated that no less than 15,000 horses died in New York last year, of which over 1,000 were taken from the streets for treatment in veterinary establishments. removal of dead horses from the streets is attended to by the New York Department of Health; the care of sick horses devolves upon the veterinarians of the city, while emergency relief is undertaken by the American Society for the Prevention of Cruelty to Animals, which was started about 40 years ago, and which maintains horse hospitals in Manhattan and Brooklyn. The present ambulance equipment consists of seven vehicles, five of which are horsedrawn, one is of the petrol-electric type—but is to be converted to an electric vehicle—while the latest, which was put into service last spring, is an electric vehicle built on a two-ton chassis by the Commercial Truck Co., of New York. As will be seen from the illustration (page 327) of the ambulance, for which we are indebted to the Edison Monthly, the rear axle is dropped in order to enable the floor of the vehicle to be brought close to the ground. For convenience in handling sick horses, the vehicle is provided with an additional bottom board or stretcher which can be rolled down the inclined tailboard to the street. The horse is strapped to this, and then, by means of an electricallyoperated winch and cable, is hauled into the vehicle. The battery of accumulators is carried in a compartment below and behind the driver's seat, and the vehicle is driven by motors mounted on the front axle. The vehicle has a maximum speed of 14 miles per hour, and has covered a

THE VOLTACAR ELECTRIC TRADESMAN'S VAN (see page 329):

distance of 40 miles on a single charge. So far its longest emergency call required a round trip of 32 miles. It is during the hot summer months and in the winter when the streets are covered with ice, that the ambulances of the Society

are busiest. As many as 55 calls have been answered in a single day, while frequently there are 30 or more.

### Edison Vehicle Progress.

It may be of some interest to our readers to know that Messrs. Edison Accumulators, Ltd., have had orders placed for 36 vehicles during the present year. These include 18 half-ton delivery vans for Messrs. Harrods: also vans for the Wilts United Dairies and Hovis, Ltd., and a truck for Messrs. Hadrields.

For municipal service the Liverpool Corporation has ordered a 2-ton van, and the Glasgow Corporation  $\frac{1}{2}$ -ton, 1½-ton, and 3-ton vehicles; while, we understand, that the Edinburgh Corporation is also obtaining a 30-cwt. van.

Following the lead of South Shields in regard to Edison battery buses, four similar vehicles have been ordered by the West Bromwich Council, and an equal number by the York Corporation; the Loughborough Motor Omnibus Co. has ordered one 'bus with the option of taking three more this year.

As previously mentioned, the Barnes Council has also decided to purchase four Edison electric dust-vans with automatic tipping bodies.

### LIGHT ELECTRIC DELIVERY VAN.

A vehicle, which has been named the "Voltacar," has lately been introduced by the Cyco-Lectric Co., of 1,790 Broadway, New York. It carries 5 cwt., and is intended to meet the requirements of small tradesmen and others having need for some means of making frequent and rapid deliveries within a restricted area.

The mechanical portion of the chassis is of simple design. The electric motor, taking 40 amperes at 28 volts, is mounted centrally in the pressed steel frame, and drives the back axle through a longitudinal propeller shaft and overhead worm gear. A universal joint is introduced between the shaft of the motor and the propeller shaft, the latter being also provided with a sliding joint at its rear end.

The necessary current is supplied by a battery of 12 lead or 24 Edison cells, the capacity being stated to be sufficient for a run of from 35 to 50 miles on one charge at a speed of 15 miles per hour. In order to provide sufficient traction whether the vehicle be empty or loaded, the accumulators are carried in a receptacle above the back axle, this receptacle also forming the driver's seat.

Owing to the employment of a low-voltage battery, the individual machine with single battery would be unduly expensive; for this reason purchasers are being given an opportunity of purchasing two extra batteries with the machine, so that all three can be charged at the same time with maximum economy; furthermore, the user will always have a battery in reserve ready for emergency service needs.

The controller, the lever of which is mounted below the horizontal steering wheel, works in a notched quadrant plate, so that there is no danger of accidental reversal of the The mechanical details have been worked out with great care, one example of the up-to-date design being seen in the front steering road wheels, the hubs being made concave so that the steering pivots fall in the vertical plane of the wheel centres, so greatly reducing the wear on the tires. The usual brakes, operated by a pedal, are fitted to drums connected with the hubs of the rear wheels.

The vehicle has a wheel base of 5 ft. 8 in., and a track of only 3 ft. 4 in , so that it can be stored in a relatively small shed. The body, which has a volume capacity of about 24 cb. ft., is provided with lift-up doors at either side.

A feature of the vehicle which will appeal to the tradesmen for whom it is intended is its relatively low price, £117, complete with battery. As a means of popularising the new vehicle, an original scheme of contract service has also been devised, by which a tradesman can buy a vehicle without the battery at a proportionately reduced cost, while the battery and all service will be supplied by the company. This work will include the exchange of the discharged battery for a fresh one once a day, or oftener if required. maintenance of the car in first class condition, including the replacement of all parts from whatever cause, and also the the tires and repainting of the vehicle once a year. For this service a flat rate of 9s. 4d. per day will be charged.

A further project of hiring out the vans with uniformed drivers at a flat rate of 16s. 8d. per day is also in

A second type of van has been developed by the Cyco-Lectric Co., with the driver's seat at the front—the battery being below it—and a van body behind, with a capacity of about 50 cb. ft.

### CITY NOTES.

(Continued from page 324.)

### South Metropolitan Electric Light and Power Co., Ltd.

MR. H. St. John Winkworth presided on Monday, at Winchester House, E.C., over the annual meeting. He first referred to the war, and stated that 24 per cent. of the staff had joined the forces of the Crown, which was the limit the company could spare, bearing in mind its serious responsibilities. The company had agreed to reinstate the men at the end of the war, and in the meantime to make up the difference between the Army and Navy pay and the full salary or wages each man was receiving. Notwithstanding the war, the progress of new business had been fully maintained. Five hundred and eighty new consumers and 41 277 lamps (equal ties. The company had agreed to reinstate the men as me end of the war, and in the meantime to make up the difference between the Army and Navy pay and the full salary or wages each man was receiving. Notwithstanding the war, the progress of new business had been fully maintained. Five hundred and eighty new consumers and 41,277 lamps (equal to 1,179 Kw.) were connected during the year. The latter figure, however, included an addition of about 9,000 lamps (35-watt) made as the result of an inspection during the year of the large power installations, which revealed the fact had additional motors had been connected without notice to the company, the whole of which might not have been added during the previous year, and some even before that. The recombination of the previous year, and some even before that. The recombination of the previous year, and some even before that. The recombination of the previous year, and some even before that. The recombination of the previous year, and some even before that. The recombination of the previous year, and some even before that. The recombination of the previous year, and some even before that. The recombination of the previous year, and some even before that. The recombination of the last three years. Turning to the revenue account, however, as might be expected in the ahormal conditions of the last five months of the year, the increased business obtained, due to restricted lighting, a general desire to economise, and reduced demands for certain classes of power. The factory load was also affected in the earlier part of the year by a dispute in the building trade. The total units sold amounted to 6,692,481, as compared with 6,662,842 hast year, an increase of 5, per cent. Although considerable additions were made to the connections for power, the factory load fell off by about 165,000 units, which was a little more than made good by increased sales for lighting, heating and cooking, and the average price realised was a triffe higher in convequence. The receipts and of th the present time. The business of the West Kent Co. was being actively developed, and the net revenue for the past year showed a satisfactory profit upon the capital employed. Further important orders for power and light had been secured, which guaranteed a gross revenue of nearly £10,000 for the present year, and a minimum of over £20,000 a year from January 1st, 1916. The greater part of these demands would be supplied from the South Metropolitan Co.'s power house. E.H.T. mains were now being laid to afford the supply, which were expected to be completed about the middle of this month. He was pleased to say the West Kent undertaking was becoming an important and valuable property, and as the South Metropolitan Co. held practically all the shares of the West Kent Co., whose powers were held in perpetuity, it would benefit materially by its profitable development. It was very difficult to give any forecast of the future in the present disturbed state of affairs, but the progress of new business continued, the number of orders obtained up to date being about the same as for the corresponding period of last year, while the factory load for the month of January of this year was practically the same as for January of last year, and the wester at the wester revealed an increased cutart. On year, while the factory load for the month of January of this year was practically the same as for January of last year, and the meters at the works recorded an increased output. On the other hand, they were having some difficulty in connection with the delivery of coal. The contracts were made at reasonable prices to satisfy their requirements until the middle of next year, but it was difficult to obtain proper deliveries. Moreover, the quality of the coal, as frequently happened in times of shortage, was not up to the proper standard. They were providing for part of their requirements by the use of coke breeze, and every effort was being made to keep the generating costs at as low a figure as possible. In conclusion, the Chairman referred to the loyal services of the staff, to whom he considered the thanks of the company were greatly due.

by the use of coke breeze, and every effort was being made to keep the generating costs at as low a figure as possible. In conclusion, the Chairman referred to the loyal services of the staff, to whom he considered the thanks of the company were greatly due.

Mr. H. W. Bowden (engineer-in-chief), in seconding the motion, said that notwithstanding the year under review being an abnormal one, their costs of generation were again the lowest on record for the company. The last new turbine plant had been largely responsible for the improved results in the generation of energy. The machine was put into commission in May. 1913, and had proved highly satisfactory. The work done during the year by this machine represented 8.37 million units out of a total 9.21 million units generated at the power house, equal to 91 per cent. of the total output. Important work had been carried out during the last few months in their efforts to burn inferior fuel, called "coke breeze." The fuel was of the lowest grade leaving the gas retorts, and could be obtained quite cheaply, owing to the power house adjoining the gas works. After inspecting several boilers on the Continent burning coke breeze successfully, a contract was entered into with the Gas Co. for the supply of breeze, and the apparatus placed on order to make a trial on one boiler. The results obtained (although by no means complete) had justified the trial and the arrangements then made. This was more marked if they had regard to the very high price of fuel at the present time. The boiler on test had been working almost continuously for the past few weeks on coke breeze unassisted by coal, producing practically the full output of the boiler. The saving in fuel was considerable, and if the results could be ensured without additional expense in repairs and attendance their costs of generation should in normal times show a marked improvement when further boilers had been guipped. So far as he was aware, it was the first power house installation in this country where mechanical

Efficiency of distribution,-76.92, compared to 78.71 last year. Output of feeders.—8.7 millions, compared to 8.46 millions. Units sold.—6.69 millions, compared to 6.66 millions. Units soid.—0.09 millions, compared to 6.6 Maximum load.—4,200, compared to 0.34d. Coal cost.—0.30d., compared to 0.51d. Works costs.—0.49d., compared to 0.51d. Total costs.—0.85d., compared to 0.87d.

There was a reduction of 0.04d. in the coal costs, enabling the company to maintain second place for lowest generating costs of London supply companies so far as results were at present published.

Mr. Hughes asked if the amount which had to be paid

under the debenture trust deed was cumulative. In other words, how much profit would the company require to make in a year before they could declare a dividend.

The Chairman said the amount to be set aside under the debenture trust deed varied according to the capital expenditure. Last year it was £14,700, and this year £15,374.

Mr. Joyce Thomas alluded to the fact that during the ten years he had held shares he had received but one dividend of 24 per cent. He asked for some explanation regarding the issue expenses of capital.

Mr. Horace Boot asked if the company was to attain its

Mr. Horace Boot asked if the company was to attain its silver or golden wedding before the shareholders received a dividend. Personally, he could see no dividend in sight until the debenture interest was out of the way. When the fresh capital was raised he strongly criticised the arrangement, and it really looked as if some of the shareholders were not fools, and foresaw what would happen. With regard to Mr. Bowden's statement, he would like to know the price at which he bought the coke breeze, because he himself went very table in reaching the continuous countries.

he bought the coke breeze, because he himself went very fully into the question in regard to some big works. At that time the coke breeze was offered at 6s. a ton, and recently the price had gone up to 8s. 0ld. Mr. Bowden spoke of the same output with the coke breeze, but his experience of using it and trying to get the same output was that it meant reducing the life of the boiler by one half. They did not want that, for the future of the company rested on the capital expenditure being kept as low as possible.

The CHAIRMAN said the preference shares issued were issued to the shareholders, who were given a commission of 1s. for each share subscribed. But for the war there was no doubt but that year they would have had an improvement of £5,000 in net profits, which would have meant that they would have but that year they would have had an improvement of £5,000 in net profits, which would have meant that they would have £20,000 available after providing for the debenture and preference share requirements, and would have enabled them to provide a reasonable dividend. The new business obtained last year had at any rate been fully equal to the average business obtained during the past three years, and they had large new business coming, as he had told them, and therefore in normal times they should be able to pay the ordinary shareholders quite a satisfactory dividend. Indeed, he believed they would be able to give the ordinary shareholder such a return as would repay him for the long years he had waited. He had every confidence in the inherent soundness of the undertaking, in the large undeveloped area, and also in the prospects of the West Kent Co., whose powers were held in perpetuity. held in perpetuity.

The report was then adopted.

Warrants for dividends, payable March 1st on the 7 per cent. cum. first preference shares and 6 per cent. cum. second preference shares, have been posted.

South Staffordshire Tramways Co., Ltd. - The accounts for 1914 show an available sum, including £603 brought forward, of £3,728. A dividend of 3½ per cent on the preference shares is recommended, leaving £843 to carry forward.

City of Carlisle Electric Tramways Co., Ltd.-The gross revenue in 1914 was £10,311. After providing for repairs, maintenance, &c., debenture and loan interest, and appropriating £1,000 to reserve for redemption of second debentures, the credit balance of £33 brought forward was increased to £586.

Aberdeen Suburban Tramways Co. - The halfyearly meeting was held on Friday, when the directors' report and balance-sheet were adopted.

Manila Electric Railroad and Lighting Corpora-tion.—The directors have declared a quarterly dividend of 13 per cent. for the quarter ending March 31st.

Mansfield and District Tramways, Ltd. -The directors, after placing £1,400 to depreciation reserve and £1,000 to renewals fund, recommend a dividend of 6 per cent. on the ordinary shares for 1914, carrying forward £1.535.

John Spencer & Sons, Ltd.—An interim dividend at the rate of 5 per cent. for the half-year ended December last is

Brazilian Traction, Light and Power Co., Ltd.-The directors have declared a dividend of 1 per cent, for the three months ending March 31st, on the 6 per cent. cumulative perference shares.

Metropolitan Electric Supply Co., Ltd.—Dividend on the ordinary shares for the last half of 1914, at the rate of 3 per cent. per annum, making 3½ per cent. for the year, compared with 41 per cent. a year ago,

### Mather & Platt, Ltd.

SIR WILLIAM MATHER presided at the annual meeting, held on February 26th, at the works at Manchester. Comparing the results of the business during 1914, he said that in his opinion they were very satisfactory. A dividend of 10 per cent. on the ordinary shares plus a bonus of 21 per cent. free of income tax had been declared. In arriving at their statement of profit during the centers. ment of profit during the past year, the directors had thought it prudent to first secure the business against unforeseen contingencies that might arise in consequence of the unpretingencies that hiight arise in consequence of the unpre-cedented situation created by the sudden change from long years of peace to a state of war on a colossal scale. They, therefore, decided not to add to the already large reserve fund, but to carry forward a larger sum than ever before—£66,838. The directors did not anticipate a revival before—£66,838. The directors did not anticipate a revival of active business with the countries engaged in war to any great extent during the war. The firm had contracts booked with such countries, but would be unable to execute them until after the war. Meantime, their works were fairly well employed and they had undertaken certain contracts which the Government placed with well-equipped firms. It was a popular delusion that Government contracts were exceedingly profitable. Such contracts had to be completed under tree. popular delusion that Government contracts were exceedingly profitable. Such contracts had to be completed under tremendous pressure, and it was the duty of contractors on patriotic grounds to make every effort, regardless of cost, to supply the Government with what they needed; by strain and stress and all possible overtime the work had to be done to meet the demands. Another consideration which would affect the profits of most industrial concerns during the war was the indisputable fact that the cost of food had risen, and might still rise to a price that would sensibly affect the war was the indisputable fact that the cost of food had risen, and might still rise, to a price that would sensibly affect the workpeople of the country by seriously diminishing the purchasing value of wages. This was a grave question which employers and all concerned with industrial undertakings should meet sympathetically and patriotically with the desire to lighten the burdens of their workneople. The working classes, being most numerous, furnished most of the fighting men. Their families would feel most acutely the pinch of excessively dear food. It was not right to ask sacrifices of them for the common weal greater than those which all other classes made according to their means. Charitable relief of the working classes was least effective and most demoralising. The greatest help that could be given to workneople was to classes made according to their means. Charitable relief of the working classes was least effective and most demoralising. The greatest help that could be given to workneeple was to provide them with work at a living wage, adjusted to the cost of living frugally and carefully with self-denial and self-restraint on their part during the war. It seemed to him that company directors and shareholders should frankly face the facts affecting the neople's food supply. Large dividends during war times should not be a primary consideration with them. They should first try to provide as much work as possible at wages that would enable workmen to reasonably nourish themselves and their families, having due regard to the avoidance of waste and self-indulgence. Business profits earned under those principles might be small, but shareholders ought to bear the sacrifice of part of their dividends as their contribution towards the relief of the universal suffering which the war had caused. Strenuous efforts should be made to keep the industries of the country alive during the war. Violent trade disputes on account of wages amounted to high treason at such a time. The war would pass all the sooner if those concerned in the industries of the country held well together, and after the war a long, lasting peace, with great prosperity, would repay them for the sacrifices they had now to make in order to secure the victory. had now to make in order to secure the victory.

### Northampton Electric Light and Power Co., Ltd.

THE annual meeting was held at Northampton on the 25th ult. Mr. F. H. Thornton, J.P., presided, and said that the year had been one of continued success and progress. The company had sold nearly £2,000 worth more current than in the previous year, an increase of 8½ per cent. In units the increase was 15 per cent. in power and 8 per cent, in current sold for lighting. They had done that with an increase of only £100 in the cost of coal. That was due to the fact that they had the advantage of the new turbine of 1,800 H.P., which was put in last year, and also to the fact that they bought their coal during the year at a decreased price of 6d. per ton. The company had experienced a great increase in the amount their coal during the year at a decreased price of 6d. per ton. The company had experienced a great increase in the amount of current sold for cooking, which might be attributed to the fact that they were now letting out cooking stoves at 5s. per quarter, and people found that cooking by electricity was as cheap, if not cheaper, than any other form and much pleasanter. They had also had an increase in the current sold for heating, the new type bar radiator giving a very much better heat than the old type. On cold days there was a very appreciable increase in the quantity of current sold for heating. Those two things were most satisfactory, for they showed that people in the town were realising the possibilities of electricity for domestic purposes. They anticipated that they would go on in the future with as much success as in the past. The undertaking had developed in a way they never anticipated eight years ago. They did not anticipate that the cost of coal would increase very materially, and they had even a very favourable contracts for the ensuing year. Although they had favourable contracts for the ensuing year. Although they had had difficulty in getting coal along the railway, because of it being taken up for military purposes, they had been able to get an ample supply in consequence of the Government considering their undertaking to be a valuable concern in

helping the boot industry, which was carrying out big Army contracts. The amount put to the reserve fund was £250 more than last year, but it was the right thing to be on the safe side in that respect. The year had been a strenuous one, but the staff had worked with as much keenness as if the undertaking had been their own. The great difficulty had been to obtain material to carry out orders, with which they were inundated owing to Admiralty contracts.

Mr. W. Tomes seconded. He said the great strides which had been made by the company could be seen by the way in which the mains had been extended throughout the town. They were already supplying one of the suburbs, and they might look for an increased custom in that direction.

### Fife Tramway, Light and Power Co., Ltd.

PRESIDING at the annual meeting, held in Edinburgh, Mr. WILLIAM Low said that the earnings from the Dunfermline and District Tramways Co. during the year, paid over to the company by way of dividends and management fees, amounted to £15,250, compared with £15,020 for the preceding year, and £12,200 for the year 1912. Keeping in view the abnormal conditions since the beginning of August last, shareholders were to be congratulated that this department had done so well. The growth of traffic continued steadily during the first seven months of the year, and at the end of July the earnings were over £1,000 in excess of the corresponding period for the previous year, due to some extent to the opening of an additional line. Notwithstanding the diminution in receipts during the latter part of the year, the tramways revenue was still slightly greater than for any previous year. The company had statutory powers for the construction of a tramway to Rosyth Naval Base and Inverkeithing. These powers expired in July next, and the directors had made application for an extension of time for construction, and for the laying of a connecting line along the North Queensferry Road. Turning to the power and lighting business, the Chairman said the revenue from the Fife Electric Power Co. and the electric light undertakings received by this company as dividends and management fees, amounted to £11,276, as compared with £8,561 for the preceding year—an increase of nearly £3,000. The increase in profits, although very satisfactory, would have been greater had normal conditions prevailed throughout the whole year. The additional generating plant at Townhill power station was installed during the year, and the capacity of the station was hereby nearly doubled. A coal conveyor gear was now being installed and would be complete in a week or two. The economy in coal-handling would largely compensate for any abnormal price of coal during the current year. The transmission lines and mains had also been extended during the year, increasing the of the company's supply. With reference to the current year, notwithstanding the disturbed condition of affairs the directors had every confidence that the earnings would be maintained, and even possibly increased. The earnings of the power company up to date this year were in excess of the corresponding period of last year, but it was somewhat difficult to forecast the earnings of the tramway company. The directors, however, felt confident that the combined properties would produce a result at least equal to that of last year. They had additional debenture powers of approximately £170,000. In the past their directors had taken care of extensions by the issue of ordinary and preference shares, without encroaching, except to a minor degree, on the borrowing powers of the company, which were in reserve for extensions in future.

Mr. George Balfour, in seconding the resolution, pointed out that the power company, without further expenditure apart from expenditure on incidental auxiliary plant and extensions to cables, was now in a position to sell an amount of electricity largely in excess of the present demand.

The report was adopted.

### Rushden: and District Electric Supply Co., Ltd.

The annual meeting was held at Northampton on February 25th. Mr. F. H. Thornton, J.P., presided, and in the absence of the Secretary (Mr. H. St. John Browne), who is away on active service, the duties of secretary were discharged by Mr. E. M. Browne. The Chairman said that for the first year's working the accounts were most satisfactory. There was a small net profit of £6 3s. 8d., and, considering they had nothing to start with, it was creditable to have a profit instead of a loss. The number of customers at the end of the year was 79, and since then it had gone up to 86. The quantity of current sold in the first quarter was £69, in the second £68, in the third £100, while for the Christmas quarter the receipts from the sale of current were £247. They might now look forward to going on upon a paying basis, as people were constantly being connected up. It was an extremely satisfactory thing that they sold so much current for motive power. At first people were a little shy of taking it, but one manufacturer who had just had his factory connected with the mains at once asked if he could buy some shares. That showed how satisfied he was. At the end of the year the number of lamps was 5,561, and they had since added about 1,000. The company was lucky in having oil as its chief fuel. THE annual meeting was held at Northampton on February as it was more easily obtainable along the railway at the present time than coal.

Mr. Clark seconded.

### Liverpool Overhead Railway Co.

THE annual meeting was held on February 23rd at Liverpool, Mr. H. C. WOODWARD presiding.

The CHAIRMAN said that the war had monopolised their thoughts and affected every industrial and trading enterprise, and especially the working of the great system of railways. Their system was placed under the care of the Railway Executive Committee, but that body did not interfere with the actual working and management in detail of the various railways beyond what military necessities might require. The plan involved the pooling of all net receipts, with the intention that those railways that showed an increased net revenue owing to the war, should contribute out of the excess to recoup, to a certain extent those companies that suffered by diminished certain extent, those companies that suffered by diminished traffic. Consequently, as their revenue had increased, they had to pay over a certain amount, not yet exactly ascertained; but seeing that they already had an increase in the first half-year, seeing that they already had an increase in the first half-year, they were practically guaranteed that they should be in **no** worse position than in the previous year; and on the whole he thought it was a fair arrangement, and was agreed to by all the great railway concerns. This plan, of course, affected the form of the accounts. They had carried during the past year, on railway and tramway, exclusive of season-ticket holders, a total of 13,361,944 passengers, being an increase of 178,623 over 1913, and nearly 1,200,000 over 1912, and it was the greatest number carried since the railway was opened for traffic. This represented an increase of 5 per cent, in their traffic. This represented an increase of 5 per cent. in their first-class and 1 per cent. in third-class, but a decrease in the "workmen" class of 3 per cent. The general increase was partly due to the presence in the spring of the new Cunard liner Aquitania in the Gladstone Dock, which proved a great attraction, while the encampment of troops at Seaforth, Water-line and Creeks metrally believed the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state loo, and Crosby materially helped their tramway traffic in the early autumn. After paying preference dividend they recommended a further dividend on the ordinary shares at the rate mended a further dividend on the ordinary shares at the rate of 3½ per cent. per annum (making 3 per cent. for the year). The ordinary dividend was the same as for 1913. The total expenditure on railway and tramways amounted to £56,845, being an increase of £1,369. This was partly accounted for by an increase in wages and extra cost of coal. Out of their employés 42 had joined His Majesty's Forces, which was equivalent to about 12 per cent. of the whole of the staff, and this made them rather short-handed in some departments. It gave him great pleasure again to testify to the good conduct of the men and the ability and energy of the general manager (Mr. E. J. Neachell) and his principal assistants, while he could not pretend that their modest dividend of 3 per cent. on the ordinary stock was entirely satisfactory to the shareholders in these days of high prices, yet, looking to the reports and dividends of other railways throughout the Kingdom, he thought they must be thankful that they were able dom, he thought they must be thankful that they were able to come through so strenuous a year without any reduction of dividend, and with increased reserves.

Mr. G. D. Killey seconded, and the motion was carried.

### London Electric Supply Corporation, Ltd.

MR. R. H. Benson presided on February 25th, at Winchester House, E.C., over the annual meeting. He said that the Board felt very well satisfied with the latest year's addition to the figures, and this happy result had been accomplished simply by minding their business. Special thanks were due to the officials, beginning with Mr. Bain and Mr. Partridge, and including not merely the seniors in the department but also those juniors who had not enlisted, and who were just as useful to their country in this instance by staying at home and cheerfully doing what their hand found to do. The figures established new records in units sold, in cost of generation, and both in net and gross receipts. The gross receipts showed a rise of over £28,000, and the net had increased from £71,753 to £92,234—an increase of no less than £20,481. This in such a year was a result on which the board felt they had the right to congratulate themselves. But for the war the net revenue would have been even higher, for he need not tell them that the rise in the price of coal in the later months had affected their Mr. R. H. Benson presided on February 25th, at Winchester rise in the price of coal in the later months had affected their expenses, whilst the darkening of London at night had diminiexpenses, whist the darkening of London at night had diminished the demand for light. The results financially justified the policy they had pursued now for a good many years of developing, and directing their chief efforts to, power supply. They had always believed that by generating current on a sufficient scale they could sell it as cheaply as any similar company in the world and make profits besides, and they claimed to have done both. They recommended a dividend on the ordinary stock of 4 per cent, instead of 3 per cent, as last year. This, he was aware, might be considered by some shareholders as ultra-conservative, but the conditions were exceptional. The war and the doubt of its duration overshadowed everything, and it affected capital as well as revenue. They could not tell what coal was going to cost them, and therefore they had got to husband their resources until the situation became clearer. Also they had got to face the situation, the solution of which was becoming more necessary, viz., that of their overspent capital account, which now amounted to over £137,000. They would remember that as long as Lord Wantage was alive he provided the money the company needed for additional plant to meet the expansion of the business, and alone shouldered other people's burdens, but since his death they had had to rely or shed the demand for light. The results financially justified the

themselves. Year by year he had had to point out that as the period of their tenure decreased as 1931 approached, so did the amount of the sinking fund increase, which was needed to ex-tinguish fresh issues of capital. For instance, the sinking fund for the redemption of the debenture stock by 1931 demanded for the redemption of the debenture stock by 1931 demanded in cash £12,000 a year out of revenue, in addition to the sums receivable annually from their good friends and neighbours, the Westminster and St. James's Companies. This year out of surplus revenue they had allocated £7,000 to contingencies account and £10,000 to reserve, and they further increased the carry forward from £5,097 to £8,828. That was a measure of conservation prescribed by the necessities of the situation caused by the expansion of their business during wartime. He would like to draw attention to the fact that, concurrently with the large increase in the number of units sold—no less than 11,000,000—they would notice that the total generating cost that 11,000,000—they would notice that the total generating cost that 11,000,000—they would notice that the total generating cost that 11,000,000—they would not 5d. That was, of course, partly the direct result of the larger output, but it could not partly the direct result of the larger output, but it could not have been achieved if they had not in their engineers and staff an altogether exceptional combination of ability, zeal and goodwill, and it was a great pleasure once more to give full testimony to what the Board and the shareholders owed to those on whom the practical working of the business depended. This figure of \( \frac{1}{2}d \), for the cost per unit sold was actually by far the lowest reached in London, and as Mr. Bain pointed out last year, even in Chicago, where the great company sold 1,250 million units per annum, against their 46 millions, it did not equal them. So far as their company was concerned thereyear, even in Chicago, where the great company sold 1,250 million units per annum, against their 46 millions, it did not equal them. So far as their company was concerned therefore, their figures demonstrated that in the area which they served London was not suffering from any lack of a cheap supply of power. That bogey, which had furnished a popular excuse for yearly attacks on the statutory terms on which electrical enterprise was undertaken, was now he hoped finally laid to rest. There was no longer any excuse for outsiders to try and get in between the County Council and the 13 companies and blandish the public with illusory promises of cheaper power. When the war was over it was to be hoped the parties interested would get together, and either under the Act of 1908, or further powers, would "associate," to use the words of the Act, to combine their plant, and so get the utmost economy in generation. For the present, the London County Council had dropped their Bill, and the ten companies, who also had a Bill, had in deference to a suggestion of the Chairman of Committees, also dropped theirs. Therefore, he need not discuss the vexed question of private enterprise compared with municipal enterprise, especially as he did so at some length last year. But he wanted to draw public attention to the solution which had lately been reached for a similar problem, after four years of violent disputes, in the problem is the proper of the lurary and west preventive efficiency. public attention to the solution which had lately been reached for a similar problem, after four years of violent disputes, in one of the larger and most progressive cities in America. The municipality of Kansas City had granted to the Tramway and Lighting Co., a new franchise for 30 years after or during which the undertaking was purchaseable at an agreed fixed price of 5,130 thousand dollars, plus proved capital expenditure during that period, and in the meantime, the municipality was to receive two-thirds of the net revenue remaining after providing certain capital expenditure and 6 per cent. upon the purchase price. In other words, the company got 6 per cent. upon the agreed valuation, plus one-third of the profits, and this profit-sharing of the municipality was a better bargain for the municipality than their fixed rate. America was a great country of experiment and they dashed into all gain for the municipality than their fixed rate. America was a great country of experiment and they dashed into all sorts of things—some successful and some unsuccessful. They might in this country do worse than copy their successful experiments. It was 14 years since Lord Wantage presided over that meeting, and, although he did not live to get a dividend, yet his courage never wavered, and he had the satisfaction before his death of seeing the company in comparatively smooth waters after its costly pioneering in the effort to give the public of London a supply of electric light and power. He had told them how Lord Wantage furnished money on easy terms whenever the company needed it and they would easy terms whenever the company needed it and they would remember that whereas their ordinary share capital was originally £555,000, they wrote off £2 of the £5 shares and reduced it to £33,000, and in that reduction Lord Wantage was the chief sufferer. In 1901, the year after his death, the total capital was £914,700, and the net revenue was £25,220. Last year the capital was £1,291,555, and the net revenue was £93,234. In other words in these 14 years their capital had increased by 41 per cent., while their net revenue had increased by 269 per cent. He need say no more to give them confidence in the company and in its ability to work out its own destiny. He did not mean to say that they could expect such a ratio of increase of net revenue this year. On the contrary, during the wartime, all companies seemed to be expecting a set-back, chiefly because of the price of ceal and the diminution of lighting; but he wanted them to realise the steady progress made year by year for 14 years by the fact that net revenue had increased compared with capitalisation by 6½ to one. tion by 61 to one.

Mr. R. Stewart Bain, the managing director, seconded the

motion and gave as usual some interesting particulars regarding the year's work. He said the capital expenditure had amounted to £34,956, the greater portion of which had been incurred for the new 10,000-kw, turbo-generator ordered in connection with the extension of the electrification of the Brighton Railway. That plant was to have been delivered last November, but owing to the war, delivery had not yet taken place, although they were informed by the manufac-

turers that it was nearing completion. In addition, £8,600 was expended in laying several miles of new mains, particularly in connection with the supply of power for industrial purposes, which he was glad to say was extending very satisfactorily, bringing the total of mains laid to 207 miles. The expenditure was £6,801 more than last year, of which coal accounted for £5,600. As against that they sold over 11 million units more than in 1913, the consumption of coal being 73,000 tons, as compared with 62,000 for the previous year. The average price paid for coal during the year was 14s. 1d. per ton, as against 15s. 2d. in 1913, but the extra cost during the last five months of the year had added nearly 1s. a ton over the whole year. Since the beginning of this year, the price of coal had increased very materially, owing to the difficulty in getting delivery by water. During the last two months the charge for freight alone had been more than the total contract price for the delivery of the coal alongside their wharf. It had been quite an anxious time getting deliveries sufficient for their consumption. He was glad to say that up to the present they had been able to overcome those difficulties without unduly depleting their stock, although the difficulties and the price of coal were daily increasing. The gross revenue showed an increase of £28,000 over the previous difficulties without unduly depleting their stock, although the difficulties and the price of coal were daily increasing. The gross revenue showed an increase of £28,000 over the previous year. The average price received for every unit sold—lighting and power—was 94d., as compared with 1.04d. in 1913, while the cost of production had been reduced from .62d. to a halfpenny. Their executive and technical staff had every reason to feel proud of such excellent results and they were a fine tribute to their efficiency and zeal. As far as that company was concerned, it could not be said that the district which they supplied was suffering from the want of a cheap supply of electric power, and it was doubtful whether unification of the system of supply, or amalgamations of the companies, although beneficial in other respects, would show such good results. The results compared favourably with those of any company, either in this country or abroad. Traction and power supplies again showed satisfactory increases, although power supplies again showed satisfactory increases, although the large increase of power for the extension of the electrifica-tion of the Brighton Railway, which was to have commenced this month, had had to be postponed on account of the war. In common with other companies, a considerable number of their staff had joined the colours, and in such cases the direc-

their staff had joined the colours, and in such cases the directors had agreed to keep their places open and to give them half-pay while they were absent.

Replying to questions, the Chairman said that they always made their coal contracts in the spring when, as a rule, the lowest prices were ruling, but force majcure had superseded all contracts. Nobody regretted more than the directors that they had not been able to pay a larger dividend, but they had only acted prudently in carrying forward £3,000 more than last year.

vear.

The report was adopted.

### Westminster Electric Supply Corporation, Ltd.

MR. J. BROWNE MARTIN presided on February 24th, at the offices, over the annual meeting. After referring to the death of Lord Suffield, the Chairman said that they had recommended a reduced dividend for the half-year. It would have been possible to pay the full 10 per cent., but this would have left them with a much smaller sum to carry forward; they could not recommend that course in view of the present situation for the worked not only reduced receipts that it had could not recommend that course in view of the present situa-tion, for the war had not only reduced receipts, but it had also increased expenses, and might possibly do so still more. The Government lighting regulations considerably reduced the sales for lighting during the last quarter of the year. Coal had increased in cost and was still going up. Carbons for street lighting cost much more than they did. They had also had to spend money on the protection of their stations. Then over 60 of their officials and men were serving with the colours, and they had promised to pay their wives or dependents half over 60 of their officials and men were serving with the colours, and they had promised to pay their wives or dependents half wages during the war, and to keep their places open. These half wages amounted to over £3,000 a year, which had necessitated some readjustment of duties. They had also thought it right to subscribe to the war funds. This would show them that they had had a good deal to contend with, and it was for the shareholders to judge how far they had been successful. They had not increased their charges for supply, they had maintained their full rate of depreciation, and they had only reduced the dividend for the year by one per cent. Had it not been that everyone belonging to the company had put his shoulder to the wheel such a result would have been impossible, and he was sure such a result would have been impossible, and he was sure they would desire him to thank the staff and workmen, who were just as anxious for the success of the company as were the shareholders and directors. Their stations were watched were just as anxious for the success of the company as were the shareholders and directors. Their stations were watched day and night by special constables—gentlemen who had given up their time for the country, and who were patrolling outside in all sorts of weather. It was extremely tiring and monotonous work, and they would, he was sure, wish to show by a hearty vote of thanks their appreciation of what they were doing. In regard to the valuation of their investments, there was the choice of valuing them at three dates:—Dec. 31st, 1913, as the insurance companies were doing with the approval of the Board of Trade; the end of July, 1914, as the banks had done; or December 31st, 1914. The latter date would give no result of any practical value. A date just before the war would have been possible, but credit was then beginthe war would have been possible, but credit was then beginning to be shaken, and they thought that as their investments were not intended for sale it was better to follow the insurance companies. The auditors had approved of this. They had increased their investments by taking up £25,000 of the war loan. In regard to the future, the supply of coal continued to cause anxiety. Deliveries were uncertain and irregular, and prices had gone up considerably. Both electric and gas companies had represented to the Government the difficulty they were in, and something had been done lately to improve matters. But they thought it should be possible to obtain a regular supply at a reasonable rate, and felt there was room for some improvement in both these points, an improvement which only the Government could ensure as they controlled communications. With regard to carbons for street lighting, no reduction in price could be expected for some time to come, and they would have to wait until new factories could be established of sufficient output to bring down the price more nearly to that at which they had hitherto been sold by the big factories in Germany. Their expenses, therefore, were not likely to decrease during the war. Their receipts would also be reduced so long as the present lighting arrangements were necessary. The greater part of the loss was due to reduced shop lighting, but this, he was pleased to say, would not be so heavy in the summer as in the winter. They would probably have seen in the newspapers that the L.C.C. produced yet another Bill to absorb them all, but this Bill had been dropped. They also, with nine other companies, joined in promoting a Bill for forming a company to take over and utilise to the They also, with nine other companies, joined in promoting a Bill for forming a company to take over and utilise to the best advantage the existing resources of the companies supplying electricity in London, with a view to providing eventually one uniform system of supply. The Government had, however, decided that this Bill was contentious, and therefore could not proceed. It had consequently been withdrawn, and he need not trouble them with details.

The Rt. Hon. W. Hayes Fisher, M.P., seconded the motion.

In reply to questions raised, the Chairman said the present Bill of the L.C.C. was dropped, but he could not say that it was dropped for good. As to their company and other companies substituting another Bill for the one which the Government considered contentious, he could only say there was nothing in hand at the present time, but it was only commonsense that when ten companies came together to amalgamate for a certain purpose there should be no difficulty in getting them together again if the opportunity offered. He thought seemething of the kind would have to be done or otherwise the County Council would certainly interfere. They wanted an extension of life as well as amalgamation.

Mr. W. J. Fisher remarked that he had read the company's Bill carefully and he certainly saw a number of contentious points in it. If the companies, however, came together with a reasonable desire to effect consolidation that Bill might form a good basis to go on, with the contentious points eliminated.

nated.

Replying to a question by Mr. Reed as to coal, Professor Kennedy said that in the last half-year of 1914 their coal for the station at Westminster was only about &d. a ton more than in the last half of 1913, but during the last six weeks there was an increase of something like 3s. a ton, and at Grove Road, from which they got the greater part of the supply, the increase had been on the average very considerably greater. They were adopting the policy of getting all the coal they could, and they had no reason to be anxious, but undoubtedly the prices now and in the future would be much greater. It was merely a question of getting the coals up from the collieries. The Government had put some ships at the service of the gas and electric companies, but they had hardly become useful yet, and they had to pay freights which were very high.

The report was adopted. The report was adopted.

Tramways, Light and Power Co., Ltd.

VISCOUNT CHILSTON presided over the second ordinary meeting held at 66, Queen Street, E.C., on February 25th. He said that the outbreak of the war in August had had varying effects in different localities. In some of the districts served by certain subsidiary undertakings the abnormal the abnormal demand which effects in different localities. In some of the districts served by certain subsidiary undertakings the abnormal conditions had created an improved demand which, while not in time to reflect substantially for the year under review, would undoubtedly be an advantage for the current year. In other districts the abnormal conditions had an adverse effect, causing depression in trade, which affected the electric supply companies, and especially deterred prospective consumers from incurring any expenditure on motors and other appliances. Further, the public naturally took less advantage, since the outbreak of the war, of the facilities for travelling offered by the traction undertakings. the facilities for travelling offered by the traction undertakings, owing to the depression. The adverse conditions affected more particularly the districts served by the Nottingham and Derbyparticularly the districts served by the Nottingham and Derbyshire Tramways Co. and the Derbyshire and Nottingham Electric Power Co. The conditions improved in the localities referred to, and since the close of the year they had evidence of a distinct recovery. The various power and light companies were large users of coal, and it was satisfactory to report that the largest user, viz., the Derbyshire and Nottinghamshire Electric Power Co., had contracted well forward at satisfactory prices. But the high price of fuel would probably operate to a certain extent to the advantage of electric supply com-

panies, because power users, and particularly small power users, would more carefully consider the use of electricity at a time when the price of coal was high. It was satisfactory to hear from the London managers, Messrs. Balfour, Beatty, Ltd., that, notwithstanding the difficult conditions of the moment, they anticipated an increase in earnings during the current year from all the properties owned by their company. to hear from the London managers, Messars. Ballours, Beatry, Ltd., that, notwithstanding the difficult conditions of the moment, they anticipated an increase in earnings during the current year from all the properties owned by their company. So far as the year under review was concerned, the directors estimated that the outbreak of war affected the earnings to the extent of at least £3,000. A feature of all the power and light properties was that a large additional revenue could be earned from the money already expended, owing to the fact that the plant installed was sufficient to deal with a very much bigger load than at present connected, and, in addition, the cables laid were capable of serving a large number of additional consumers. The directors recommended an increase in the capital of the company to the extent of £100,000 by the creation of an additional 100,000 six per cent. cumulative preference shares of £1. He might say for the information of the shareholders that notwithstanding the number of undertakings owned by the company, they had managed, owing to the cautious policy adopted, to keep the capital expenditure, including present obligations, to within £50,000 of the amount of the original issue. They would agree that this was a very small sum spread over so many different policies, especially in view of the fact that the power undertakings covered an area of 3,000 square miles. They could, of course, deal with present requirements by issuing a portion of the unissued debentures, but this would hamper their financial arrangements in the future. It was, in their opinion, unwise to use their debenture powers to the maximum unless all development work was completed or could be provided for out of revenue. The directors had not yet decided as to what would be the most opportune time for making the issue, nor the terms. The consent of the Treasury would, of course, be required before the issue was made, but in view of the fact that the development for the national point of view in the present crisis, n

pari passu with the existing shares.

Mr. G. Balfour, in seconding the motion, said that in issuing these shares, rather than taking advantage of their debenture powers, they were following the method successfully adopted by other tramway and electric lighting companies. By keeping their debentures they could meet any emergency in the way of getting additional plant.

The resolution was adopted.

### Bruce Peebles & Co., Ltd.

MR. F. E. Andrews presided at the annual meeting, held at Edinburgh, on Friday last. He said that they maintained their gradual and steady progress in the first half of 1914, and the satisfactory results shown in the accounts for the year would have shown still better improvement over those of 1913 but for the war. Theirs was essentially and entirely a purely British concern, and at the outbreak of hostilities they had not a single German, Austrian, or Hungarian in their employ. More than 150 of their men were serving with the colours, and on their return they would be reinstated in their old or similar positions. The workmen and staff had inaugurated a fund, to which the company was contributing weekly. for and on their return they would be reinstated in their old or similar positions. The workmen and staff had inaugurated a fund, to which the company was contributing weekly, for assisting dependents where it was required. A large proportion of the men were their best and most skilled, and their absence had of necessity caused a certain amount of difficulty in the ordinary routine of the works and offices, but the loyal efforts of those remaining at home had minimised the dislocation. The output from the works, which up to the end of July had been quite satisfactory, and better than the previous year, was naturally affected for some months afterwards by the loss of so many hands. This was being gradually overcome, though they were still suffering to some extent both from the difficulty in obtaining suitable men and from delays in getting supplies of raw materials. They had fully maintained their reputation as makers of high-class electrical machinery and had obtained a good proportion of orders, so that the works had been fairly well occupied. The prices at which these orders had been obtained had also been more

reasonable than was the case two or three years ago, but the margin of profit had naturally been somewhat adversely affected by the events of the latter half of the year. In this country the company continued slowly, but very surely, to enlarge their circle of customers, especially among the better class of buyers, which was a very satisfactory sign. The Peebles-La Cour converter was being adopted by an increasing number of engineers and was also being put down in larger sizes; the largest converter made in Great Britain up to the present time had been installed and was now running at Manchester. They had all along carefully cultivated trade in the Colonies, and the results were quite satisfactory, showing a steadily increasing volume of business, though in Canada conditions had not been favourable during the last twelve-months. In various foreign countries also financial stringency or political disturbance had militated against new work being taken in hand, especially in the case of South America and China. Taking everything into consideration, however, they had no cause to be dissatisfied, and they started the new year with an amount of work sufficient to keep them well employed for some time shead. The profit for the year from manufacturing and trading amounted to £11,649, as compared with £11,751 for 1913 and £3,684 for 1912, so that in spite of the disadvantages since August they had managed to maintain the improvement of the previous year. The net profit was £3,892, as against £2,820 a year ago. This sum went to reduce the adverse balance against profit and loss account, which therefore now stood at £17,783. Debts owing by the company were lower, as were also the debts owing to them, the latter being partly due to the fact that they were able to get somewhat better terms of payment from customers. Cash at bank, £29,084, showed an increase that was very gratifying, because a manufacturing concern such as theirs must have adequate working capital in order to carry on its business in a satisfactory manner, a

British Insulated and Helsby Cables, Ltd.—The directors announce a final dividend, making 15 per cent for the year, as compared with 13 per cent for 1913. There is placed to reserve and depreciation £2,000 less than for 1918, but there is an increase of £21,000 in the amount carried forward.

British L.M. Ericsson Manufacturing Co., Ltd.—The directors recommend a dividend of 8 per cent. per annum on the ordinary shares for 1914, placing to reserve £6,000, and carrying forward £7,023.

Reduction of Capital.—Turners & Manville, Ltd., and Reduced.—A petition for confirmation of reduction of capital from £50,000 to £39,994 has been presented. Particulars of claims, &c., must be sent by March 13th to Mesers. Jackson & Co., Lower Gates, Rochdale, solicitors.

Waste Heat and Gas Electrical Generating Stations, Ltd.—The directors recommend a dividend for the year ended January, 1915, at the rate of 8 per cent. per annum, carrying forward £15,012.

Stock Exchange Notice.—The Committee has been asked to allow the following to be quoted:—Electro Bleach and By-Products, Ltd.—90,200 7 per cent. participating preference shares of £1 each, fully paid, Nos. 1 to 90,200.

Western Telegraph Co., Ltd.—Second quarterly interim dividend, 3s. per hare for the year ending June, 1915, being at the rate of 6% per annum.

Held Over.-Pressure upon our space compels us to hold over until next week various City reports and meetings.

Davis & Timmins, Ltd.—The net profit for 1914, including £15,083 brought forward, after allowing for depreciation and commission to manager, was £31,959. The interim dividend paid in September last on the preference shares absorbed £1,800; that on the ordinary shares at the rate of 6 per cent. per annum for the June half-year £1,410; there has been placed to general reserve account £3,000, and to income-tax account £626, leaving £25,124. Preference dividend on the 6 per cent. preference shares for the December half-year requires £1,800; a balance dividend at the rate of 10 per cent. per annum on the ordinary dividend at the rate of 10 per cent. per annum on the ordinary shares for the December half-year, making 8 per cent. per annum for the year, requires £2,850; a bonus of 12 per cent. out of profits amounts to £5,640; and £15,884 is to be carried forward. Annual meeting, March 9th.

*-The Société d'Electricité de Paris.*—The France.—The Société d'Electricité de Paris.—The chairman of the Société d'Electricité de Paris, which is stated to be under the control of the Empain group of Brussels, informed the shareholders at the recent meeting that the sales in 1914 increased by 20,000,000 kw.-hours to 145,000,000 kw.-hours. After deducting depreciation amounting to £128,000 from the gross profits of £259,000, and providing for interest payments on the loans, the accounts indicate net profits of £102,000, which would permit of the distribution of 16s. on the ordinary shares and 26s. 7d. on the preference shares. It is, however, impossible to make these payments at present as the "liquid funds" are said to be looked up in Stock Exchange investments. be locked up in Stock Exchange investments.

Jarrow and District Electric Traction Co., Ltd. The annual meeting was held on Monday at Electrical Federation Offices, Kingsway, Mr. H. S. Day presiding. In proposing the adoption of the report, of which we gave an abstract last week, the chairman remarked that it was with much satisfaction that the directors were able to recommend the payment of a 3½ per cent, dividend for the past year, as against 2½ per cent, for 1913. The development in Jarrow was very satisfactory, and there was every reason to hope that the business of the company there would continue to be well maintained even if it did not improve. Mr. F. Cooking seconded, and the report was adopted. Cooking seconded, and the report was adopted.

Telegraph Construction and Maintenance Co., Ltd. The directors report that the net profit for 1914 amounted to \$109,186, against \$114.863, after charging the interest on the debentures. To this is added £111.860 brought forward, making £221,047. An interim dividend of 5 per cent, was paid last July, and the directors recommend a further dividend of 10 per cent, together with a bonus of 12s. per share, free of tax. The reserve fund is to be supplemented by £20,000 (making it £145,000), leaving £111,407 to be carried forward.

City of London Electric Lighting Co., Ltd.—Subcity of London Electric Lighting Co., Ltd.—Subject to completion of audit, the directors have decided to place \$50,000 to reserve and to pay 12s. per share (being at the full reserve shares, and 18s. per share (being at the rate of 9 per cent. per annum) on the ordinary shares. On account of these shares 6s. per preference share and 6s. per ordinary share was paid in September, 1914. After payment of the dividend, less income-tax, and providing for other appropriations, £23,500 is to be carried forward.

Lianelly and District Electric Lighting and Traction Co., Ltd.—The accounts for 1914 show a net revenue, including \$2,079 brought forward, of \$12,188. After providing for loan and debenture interest, and setting saide \$2,000 for depreciation and renewals, a dividend of 2 per cent, on the ordinary shares is to be paid, leaving \$1,718 to carry forward. The annual meeting was held at 66, Queen Street, E.O., on February 25th, Mr. A. H. Beatty presiding. The report was adopted.

New York Telephone Co.—The report for 1914 shows not telephone earnings \$16,169,660, a decline of \$1,554,491; and other income, \$1,869,394, an increase of \$463,190. Total, \$18,039,054, a decline of \$1,091,301. Interest charges have absorbed \$4,027,132, an increase of \$448,317; while dividends have taken \$10,008,579, a decline of \$220, leaving balance to surplus and reserves \$4,003,343, a decrease of \$1,539,398.—Financial Times.

T. Henley's Telegraph Works Co., Ltd. Subject to audit the directors recommend a final dividend payable on March 19th on the ordinary shares of 10 per cent. less incometax, making 15 per cent. for the year, and a bonus of 5s, per share less income-tax. For 1913 the distribution was 20 per cent.

### STOCKS AND SHARES.

Tuesday Evening.

Present days are mostly unexciting in Stock Exchange circles. It is as though people had said to themselves that they would do nothing until the war gave indication of further developments. The best news received for some time past was that dealing with the passage of the Dardanelles, which had a distinctly cheering effect upon spirits, but failed

to have any effect upon prices. Definite news of the fall of Constantinople would probably have a stimulating effect; but until something of this sort arrives, investment stays its hand.

hand.

Each new issue as it appears has to be rather more attractive than its predecessor. The Treasury is putting very little obstacle in the way of new emissions; and any company which can show that it requires capital in order to provide employés with work, especially if directly or indirectly connected with Government contracts, need have little hesitation in applying for powers to raise money. At the same time, the Treasury restrictions upon Stock Exchange dealing continue to be so severe that borrowers delay making appeals to the public until they are obliged to do so.

The Home Railway market is obsessed by the latest labour fears. Through the curt intervention of the Government, immediate difficulties are bridged over; but such an erection will be only temporary, and the whole question will be revived in a more acute form later on. Londoners in particular are inclined to look at the labour agitations as reflect-

revived in a more acute form later on. Londoners in particular are inclined to look at the labour agitations as reflecting gravely upon the patriotism of those responsible for the trouble; and the plain man in the street wonders how on earth any compatriot of his can so deliberately throw in his lot with the enemy as to participate in these disturbances before exhausting every conceivable means for settling debate-

before exhausting every conceivable means for settling debateable points peaceably.

Therefore Metropolitans have gone back to 281, Districts to 171, Central London ordinary to 76, while the tone of the market as a whole is drab. Two or three of the big steam stocks are raising more capital, but we have heard no proposals of this sort in connection with the electric lines. As a point of curiosity, it may be mentioned that Metropolitan Consolidated, South Eastern deferred and South Western deferred all stand about the same price, although the dividends recently declared were 11, 1, and 11 respectively. Underground Electric income bonds are ex the dividend of £3 per cent.; at the current price of 80, the return on the money is exactly 71 per cent., paid free of income tax.

The prophets who forefold a reduction of about 1 per cent. in the City of London Electric dividend have proved correct, and the company is now paying 18s. per share—that is, 9 per

The prophets who foretold a reduction of about 1 per cent. in the City of London Electric dividend have proved correct, and the company is now paying 18s. per share—that is, 9 per cent.—against £1 per share, equal to 10 per cent., last year. The County of London maintained its previous dividend, and County preference shares have been a firm market for some time past. Curiously enough, it is difficult to obtain an adequate bid for the ordinary shares. City Lights keep about 14½, with an occasional bargain transacted in them. The Charing Cross Co. announces that the profits on its City undertaking advanced during the last financial year, but its West End receipts fell off by nearly £10,000. Mild interest is taken in the course of the London Electricity Supply Bill No. 2; as to the chance of its successful passage through the House of Commons, opinion has been already ventured here. So far, all the electric lighting companies have announced their dividends, with the exception of the Brompton. Summarised, the results are that the St. James' pays 2 per cent. less than it did a year ago. the City of London, the Charing Cross, Metropolitan, and the Westminster 1 per cent. less Smithfield Markets 1 per cent. less, Kensington, Notting Hill and County the same, and the London 1 per cent. more. All things considered, the achievements may be fairly regarded as good. Prices on the week show small falls in Brompton or dinary. Charing Cross preference, and Westminster preference. St. James' recovered their dividend of 5s., and County preference are also 5s. higher at 112.

We append our usual list of representative stocks and shares:—

11 the foreign group, Anglo-Argentine Trams 1st preference recovered to 44, so wiping out their loss of last week. Brazil Tractions at 51 are 14 higher, on improvement in the Rio exchange. Mexico Trams are a dull and weak market. The 6 per cent. 2nd bonds at 40 are nominally 10 points lower, though what a holder would get, if he wished to sell at the present time, it is difficult to say. The company has just notified that it has no alternative but to defer payment of interest on its bonds in consequence of the action of the Mexican "Government" (inverted commas are ours). Representations have been made to the Government and the United States Government on behalf of the company. Adelaide Supply Debenture stock is better at 103. The Manila Electric Railroad has declared its usual dividend of 14 per cent. for the quarter ended March 31st last.

The Telegraph, Construction Co. maintains its dividend of 20 per cent. free of tax, in spite of a small falling-off in the nett profit for the year; actually, the difference in the disposable balance is the bagatelle of £500, while the reserve fund has been again strengthened by the addition of £20,000. Shares changed hands to-day (Tuesday) at 36\frac{1}{2} and 37\frac{1}{2}. British Westinghouse 4 per cent. debenture stock is changing hands on the basis of 72; and a fairly active market is established in British Aluminium ordinary at 24s. Castner-Kellners have gone back a trifle to 3 3-16. India Rubber shares at 8\frac{1}{2} are 5s. higher, on an enquiry which found no floating supply of shares.

The Telegraph market is very quiet. The feature is a sharp fall in Indo-European shares, which dropped to 51 on the appearance of a small seller. Previously the price had been supposed to stand at 55. Chili Telephones keep dull, and a further fall of \$\frac{1}{2}\$ has occurred. Anglo-American Telegraph deferred eased off \$\frac{1}{2}\$, most securities connected with the United States being somewhat depressed in consequence of the s

dividend, the £5 shares rose to 19; the lowest they have been since is 9½, in 1905, while in the war crisis of last autumn they never fell below 13. At the present price of 14, the return on the money is 7½ per cent., allowing for the dividend

return on the money is 7½ per cent., allowing for the dividend now included in the price.

The principal feature in the raw rubber market is the practical wiping out of the premium on the Pará product, plantation and wild rubber being now virtually the same price. Since the removal of the Government's embargo upon imports of rubber, as it related to the United States, stocks have shown a decided disposition to decrease; and as trade conditions become more and more normal in America, so will the demand for rubber expand, while Japan is also taking substantial quantities. The share market is quiet and steady, without exceptional movements. The armament group improved on the news from the Dardanelles. In which connection, it may be remarked that the outstanding feature is a rise to 15s. in the one shilling shares of the Projectile (1902) Co. Before war broke out, they were about eighteenpence apiece, and almost as unsaleable then as they are difficult to buy now. buy now.

### MARKET QUOTATIONS.

Owing to the war, the prices given below are, of course, more or less nominal.

#### METAL MARKET.

### Fluctuations in February.

Soldering Aluminium.—The last New Zealand mail brings some brief particulars of a new process of soldering aluminium, which has been devised by Mr. W. Overend, a partner of Mr. H. Grinlinton, a cycle importer and manufacturer, of Auckland. It is stated that by the process aluminium can be soldered not only to itself, but also to any other metal, including cast-iron and steel, and also to carbon. It is added that the Auckland Tramways Co. has given Mr. Overend an opportunity of applying his process, and that the New Z-aland Government has placed an experimental order for 100 aluminium terminals soldered direct on carbons. to carbons.

Foreign Concessions in Norway.—It is reported from Christianis that the Council of State has adopted a Bill in regard to waterfalls, mines and other land property, which proposes the introduction of considerably more severe conditions with respect to the grant of concessions, particularly to foreigners, than those contained in the law of September 18th, 1909. In the case of waterfalls, a distinction is drawn between Norwegian companies and companies with foreign capital. Under the Bill the latter are to receive a concession in future only under special circumstances; and the greatest caution is to be exercised in this respect. The maximum period of a concession is to be reduced to 60 years, although in an exceptional case it may be prolonged to 70 years with the consent of the Storthing. On the expiration of the concession the power station and machinery and accessories, together with the workmen's dwellings, are to pass into the possession of the State free of charge. It would, however, be possible for the State in the first place to purchase the undertaking forming the concession at the end of 40 years, or for the local authorities concerned to do so in the event of the State taking no action in the matter. The Bill further provides for the headquarters of the company to be located in Norway, and for the majority of the shareholders to be Norwegian subjects. It is stated that if the Bill were passed by the Storthing, foreign capital would probably no longer come into consideration in connection with waterfalls to receive a concession in future only under special circumstance no longer come into consideration in connection with waterfalls in Norway, and the regulations proposed for the latter would also apply to mines, &c.

### TRAINING FOR THE INDUSTRIAL SIDE OF ENGINEERING.

### By A. P. M. FLEMING, M.I.E.E.

(Abstract of paper read before the Institution of Electrical Engineers, at Manchester, February 23rd, 1915.)

In the manufacture of engineering apparatus keen competi-In the manufacture of engineering apparatus keen competition has directed increased attention to every factor affecting economic production. Labour is one of the most important of these factors, and the object of this paper is to discuss the requirements of training for the various grades of employment in the manufacturing industry and the lines on which such training can most effectively be carried out. In this country, while a great deal of attention has been paid to the training of the technically-educated man, comparatively little has been done to provide the best possible training for youths who are to become skilled workmen.

of the technically-educated man, comparatively little has been done to provide the best possible training for youths who are to become skilled workmen.

The grades of employment to be considered may be divided into two classes, namely, those of a non-technical character, and those for which technical training is essential.

Preparation for "non-technical" positions, in so far as it is made at all in this country, is by means of "trade" apprenticeship, for which youths enter works straight from school at the age of from 14 to 16, and are "bound" to a trade until the age of 21. For the "technical" positions many works provide a special practical course, which may be termed "engineering" apprenticeship, the purpose of which is to afford a broad experience in manufacturing processes and methods rather than a high degree of manual skill.

To secure the greatest gain, both to the individual firm and to the industry as a whole, it is important to aim at training each youth so as to develop to the utmost his latent ability, and to prepare him most expeditiously for the position for which his education and ability fit him. While it is important to provide facilities for the able youth to rise from the ranks to a technical position, it is an error to assume that every trade apprentice is capable of so doing and to direct educational efforts solely to that end. The majority of such apprentices will work at the bench all their lives, and their training should consequently be such as to fit them for this sphere.

NON-TECHNICAL EMPLOYMENT.

The ordinary workmen comprise three main classes: (a) the craftsman or skilled workman, (b) the specialist, and (c) the unskilled labourer.

The craftsman and specialist require quite different knowledge and characteristics. The former needs to concentrate considerable thought upon his work, to possess initiative, delicacy of touch, co-ordination between hand and eye in a marked degree, a knowledge of drawing, a thorough experience of his craft, and a sufficient general knowledge to appreciate the importance and function of his efforts in the whole series of operations bringing about the conversion of raw material to the finished product.

The specialist on the other hand, mainly requires manual

The specialist, on the other hand, mainly requires manual skill in a single operation, or dexterity in operating a machine-

skill in a single operation, or dexterity in operating a machine-tool, and the ability to carry out repetition work continuously without diminution in productive capacity. Sub-division and specialisation in methods of manufacture, and the introduction of machine tools, enable many processes to be carried out by the specialist which originally required the employment of a craftsman, with the result that em-ployers have found it advantageous to exploit juvenile labour on a limited range of work rather than train it for the future supply of skilled workmen and for the ultimate benefit of the industry.

While the problem of devising some satisfactory means for determining the vocational fitness of a youth is engaging condetermining the vocational fitness of a youth is engaging considerable attention, the efforts hitherto applied appear to have resulted in very little practical benefit to the engineering trades. In this connection teachers who are in daily contact with youths in the elementary schools could render much assistance by observing those likely to be suited for skilled handicrafts. If observation is supported by a first-hand knowledge on the part of the teacher of the requirements of the trade and of its scope and possibilities, a latent desire for such a vocation might be developed and fostered in the student. In a number of institutions, recognised by the Board of Education as Junior Technical Schools, pre-apprenticeship training is provided. This includes some bench-work in metals and wood, and instruction in drawing and elementary

training is provided. This includes some bench-work in metals and wood, and instruction in drawing and elementary engineering theory. The courses thus provided are excellent in their way, but the facilities provided by these schools for teaching youths likely to become skilled workmen are insufficient for the requirements of the industry. There is need for the provision in every industrial centre of accommodation for a sufficient number of youths to supply local engineering works, and means for affording suitable preparatory education

Under present conditions the chance of a youth entering skilled trade because of his vocational fitness is so haphazard that organised efforts are necessary to ensure the proper selection of youths. No vocation affords such possibilities of secure employment, coupled with unlimited opportunities of advancement, as that of the engineering trades, and it is reasonable to direct to such a vocation the youth possessing the soundest character, best physique, and greatest intelli-

Under modern conditions a great deal of the apprenticeship period is liable to be inefficiently utilised, and even in those works where special efforts are made to teach manual operations correctly, there is a great deal of trade knowledge of importance to an apprentice which he is unable to obtain readily in the shops.

readily in the shops.

Suitable training comprises two phases, namely, practical experience in the processes and materials pertaining to the craft, and trade instruction, i.e., a knowledge of the principles underlying the methods and processes employed and of such applications of science as bear on the trade. The former can only be acquired satisfactorily in the shops, provided the apprentice is not looked upon merely as a producing unit and that systematic means are taken to teach him the manual operations of his craft. Trade instruction can best be dealt with quite separately on the lines suggested later.

In most engineering works no special facilities are provided for practical training, and an apprentice has usually to pick up such experience as he can in a more or less haphazard fashion. In some works instructors are employed, and in others a separate training shop is provided. An example in this country is the training shop for instrument makers pro-

others a separate training shop is provided. An example in this country is the training shop for instrument makers provided in Mr. Robert Paul's works in London.

The instruction that an apprentice receives during his period of training should be directed primarily to bear on his trade. In most industrial centres, however, the only instruction available is that afforded by evening technical classes, and this, while providing an excellent means by which the ambitious youth can fit himself for technical employment, is usually of little or no assistance to the youth who is to be a workman all his life. Moreover, in most firms it is not compulsory for an apprentice to pursue a course of evening instruction. instruction.

In the case of youths who have had suitable pre-apprentice-ship education, instruction should comprise the processes applying to the trades and the principles underlying them; the names, description, preparation and uses of the tools and appliances; how to read drawings and diagrams; the physical properties of the materials employed; the cost of the apparatus produced in the trade; the importance of avoiding waste of time, effort, and materials, and the function of the apparatus or parts manufactured

or parts manufactured. It is important that the instruction be so imparted as to

It is important that the instruction be so imparted as to stimulate the youth's ambition to attain higher skill, to take pride in his work, and to develop his latent powers of dexterity in workmanship to the utmost. Such trade teaching can be imparted by oral and written means; and this method possesses the important effect of developing a youth's ability to acquire knowledge from other sources than his own personal

experience.
In Germany vocational training is made an important feature In Germany vocational training is made an important feature of compulsory continuation education. Youths are permitted to leave school at the age of 14, but must continue with their education for about eight hours per week throughout the period of apprenticeship, for the most part during working hours. At Munich, around which there are a number of comparatively small industrial works, separate classes are arranged for the youths of each trade, and apart from the continuation of general education, both practical and theoretical instruction is given in the trade by skilled workmen and special instructors. In the larger industries in Northern Germany it is more usual for an apprentice school to be provided in each works, or collectively for several works; such schools are recognised by the State, and their students are exempted from compulsory continuation school studies.

Apprenticeship in engineering trades extends over a period of four years, and at the end of this time an apprentice is required to present himself before a committee of experts who examine his knowledge of the trade, and to whom he has to submit a specimen of his workmanship. Successful apprentices secure a master's certificate, and an employer is not allowed to have apprentices unless their training is supervised by one of his staff who possesses this certificate.

The importance and number of apprentice schools attached to individual works is increasing considerably, and the results obtained appear to be in every way satisfactory.

to individual works is increasing considerably, and the results obtained appear to be in every way satisfactory.

In Switzerland, continuation education of youths embodying

trade instruction is carried out on a plan similar to that in

A typical example of complete apprentice training carried out entirely in school, is that of the Skiensfjorden's Mechanical School at Porsgrund, Norway. Here about 160 youths are

School at Porsgrund, Norway. Here about 160 youths are given trade instruction and practical training during a 3-year course, part of each day being spent in class and part in school workshops. The results are said to be eminently satisfactory. In France and the United States there is as yet no national scheme for the vocational training of juvenile workers, although much has been done in this direction by individual employers in various industries. In some of the trade schools youths attend classes on alternate weeks, and in this way disorganisation and loss due to stoppage of machine tools is avoided. Apprentice schools have been established in many of the large engineering works.

In companies such as the Westinghouse and General Electric, most of the practical experience is gained in a special training shop. In the former company a youth spends about six months in the training shop learning the use of one particu-

lar tool or process, and then proceeds to the main shop, where he does similar work under commercial conditions. He sub-sequently returns to the apprentice school and learns the use of another tool or process, and so on till the end of his apprenticeship. Throughout this time he attends class instruction during a certain number of hours per week.

during a certain number of hours per week.

In the General Electric Company the apprentice spends all his time of training either in class or in the training shop. In the latter he is moved progressively from machine to machine, his proficiency being gauged by when he is able efficiently to "break in" the youth who succeeds him. A 4-year period of apprenticeship is becoming customary in the largest works.

Thering the post faw years considerable interest has been

During the past few years considerable interest has been taken in the development of the apprentice-school method of training, and most of the large works in every kind of industry

are adopting this plan.

In the various industrial countries that have been considered,

training, and most of the large works in every kind of industry are adopting this plan.

In the various industrial countries that have been considered, the combination of practical training either in works or in special training shops and of trade teaching in class is that most favoured for the training of workmen. The apprentice school attached to works represents the simplest and most efficient means of applying this principle. Apprentices work in the shops under commercial conditions for a part of each day, and attend school during certain of the working hours. This method of training affords the most flexible means of dealing with special features peculiar to individual works. The close supervision possible in an apprenticeship school enables those apprentices deserving of promotion to be readily selected. In this way the interest of the remainder is increased, and a spirit of emulation is aroused.

The apprentice-school method of instruction has been adopted by the British Westinghouse Company. Instruction averaging about five hours per week is given during working hours to all "bound" apprentices, numbering altogether about 300, in a school situated in the works. The regular rate of wages is paid during the time spent in study, and all the cost of books and stationery is borne by the firm. The teaching is done by twelve members of the firm's engineering staff, supplemented by lectures from the leading foremen and shop engineers, which deal specially with the trade subjects. The contact between the foremen and apprentices in the school produces excellent results, and removes the diffidence which many of the apprentices feel in approaching the foremen with their difficulties. Where it is required to illustrate special processes or describe particular apparatus, which cannot readily be done in the school by lantern projection or drawings, practical demonstrations are given in the works.

The most promising of the apprentices are selected for work in the testing departments and drawing office, and in other re

is aroused, and as a result increased attention is paid by them

is aroused, and as a result increased attention is paid by them in the shops to the practical training of apprentices.

This apprentice school has only been in operation for about a year, but so far the results both from the point of the company of of the apprentices are most encouraging.

While the primary function of the apprentice school is to prepare youths to become good workmen, its secondary object is to enable a selection to be made of promising youths for promotion to positions where they can be more advantageously employed, as, for instance, charge hands, foremen, and inspectors. In addition to such positions, the apprentice school affords a ready means of selecting apprentices who can profit by technical training and rise to higher posts. The provision of a channel whereby an apprentice can rise from non-technical to technical employment is a most desirable feature, and should be given every encouragement.

### TECHNICAL EMPLOYMENT.

A technically-trained engineer who enters a manufacturer's works and intends to remain in that branch of the industry requires quite different training from that of one who ultimately expects to take up, for example, civil engineering, operating work, or the broader scope met with in colonial

The various kinds of technical employment in engineering

manufacture are as follows

(1) The works side, including such positions as works and departmental managers, shop engineers, leading foremen, assistants in the inspection, testing, estimating, and drafting departments.

(2) Designers.

(3) Commercial engineers.

The works side affords an increasing scope for technically-The works side allords an increasing scope for technically-trained men possessing a bent for organisation, and in whom can be developed the capacity for handling labour and directing manufacturing processes. Such young men, after serving an apprenticeship, should take up junior positions in the works, where they can acquire the further experience and knowledge necessary for economic production. necessary for economic production.

At the present time most young men on leaving a technical

school have a knowledge only of the field of employment offered by design and commercial work, and fail entirely to recognise the importance and possibilities of executive positions in the works. Added to this, there is a feeling that the works and office staffs are of quite a different status—an idea that needs to be vigorously dispelled

The possibilities of effecting economies in the shops justify the employment there of young men of the best intelligence available in a manufacturing organisation. In this connection there is a growing tendency in large works—and one of which full advantage has been taken on the Continent—to employ shop engineers, whose function it is to supervise technical details and processes, to follow up new designs throughout the various stages of manufacture, to investigate troubles and hitches wherever they occur, to devise economic methods of manufacture, and where necessary to alter existing designs so as to enable the most economic and up-to-date methods of manufacture to be employed. Shop engineers require good technical training, suitable shop practice, and drawing-office experience. experience.

experience.

Apart from these positions, important vacancies in the estimating department should be filled by technically-trained men who have an intelligent understanding of works processes. Such men are in a position to detect leakages and determine where economies in working can be effected, which are likely to be overlooked if ordinary derical labour is employed. In the testing department the leading men should also have good technical training. This department is the backbone of the designing office, and scientifically-trained intelligence there is invaluable.

For the design branch scientific training is indicated.

For the design branch, scientific training is indispensable, and a great many technically-trained students look to it for their future employment. It is not sufficiently realised that for such work thorough practical experience in the shops, in-cluding an intimate knowledge of manufacturing costs and processes, is invaluable: Works experience is essential in de-veloping the intuitive capacity which seems to be a particularly marked characteristic of British engineers, and too much attention cannot be paid to this phase of training.

The need for really well-trained engineers for the commercial

side is becoming more and more appreciated by manufacturers. Sound technical knowledge and a considerable amount of practical training are indispensable, especially in the many-

sided electrical industry.

Of the various plans of training for technical positions, the following are those most common:—

(a) By a trade apprenticeship combined with evening or part-time study. This method is particularly applicable to manufacturing.

(b) By a short period in works, then a college course, followed by works apprenticeship. This plan is recommended by

the Institution of Civil Engineers.
(c) By taking a complete college and then a works course.
(d) By sandwiching college and works training in varying

periods

(e) By taking a complete works apprenticeship prior to the technical training. This is not a satisfactory method for training for technical positions in manufacturing.

Of these plans, (a), (b) and (c) are most suitable from the manufacturer's point of view; but whichever method is adopted, it is desirable that the practical training should terminate in the works, since a better opportunity is afforded to the student for obtaining permanent employment with the firm in which he has obtained his training. It is also most important that the entire training be preceded by thoroughly sound general education.

There is a wide diversity of opinion as to how long a period of practical training a technically-educated young man should have, and what its nature should be. Some firms adhere to the 5-year apprenticeship scheme as applying to all young men, whether they are being trained as workmen or for technical positions, but the more modern tendency is to arrange a shortened course for the latter. While long practical experience is excellent, it is not the most effective method of attaining the end in view. Moreover, a man who has had his intelligence developed by a technical-college course should be able to acquire practical experience at a much quicker rate than one not so educated. The object is to afford an insight into manufacturing methods and economics, and to acquire a knowledge of how to handle men.

In addition to the arrangements for training "trades" apprentices already described, the British Westinghouse Company has for the past twelve years trained "engineering" apprentices according to certain well-defined courses.

Young men of the age of 20 and upwards, who have had a There is a wide diversity of opinion as to how long a period

Young men of the age of 20 and upwards, who have had a thorough scientific training at a University and possess an Honours engineering degree or are in other respects considered eligible, are admitted to a 2-year course of apprenticeship on the recommendation of their college authorities. Young men of from 18 to 20 who have had a good technical education are apprenticed for three years.

In addition to the manufacturing departments, the apprentices have opportunities for entering the testing drawing-

tices have opportunities for entering the testing, drawingoffice, designing, and commercial departments. They are
moved from department to department, as a rule every few
months, and every endeavour is made to develop the apprentice's capacity by giving him responsible work to do. The first
six months of apprenticable are served on probable for

six months of apprenticeship are served on probation.

The object of these courses is to train suitable young men for the company's service in either the works or design depart-

ments, or in the commercial sections of the organisation at home and abroad. Prior to the end of their course of training apprentices are usually placed in one or more staff positions on

trial.

Heretofore, during apprenticeship, only a nominal rate of wages has been paid. Owing, however, to the fact that many promising young men have on this account been debarred from undertaking practical training, a rate of wage is now paid to suitable men which is sufficient to render them self-supporting during their period of apprenticeship.

Candidates for apprenticeship are selected strictly on merit, and are discharged during the probationary period if found to be unsatisfactory. There are as a rule about 100 "engineering" apprentices at all times in course of training, and the results of this plan of training have on the whole been excellent.

excellent.

From the foregoing considerations, the need for a clearly-defined plan of training youths for manufacturing employment is evident, and the importance of the subject justifies concerted steps being taken by manufacturers to plan the most suitable means of training, and as far as possible to ensure uniformity of action by all employers.

Special pre-apprenticeship instruction is desirable. The function of the subsequent training is two-fold. One is to select those youths who possess the ability to profit by technical instruction, and to provide for such youths facilities for their advancement to positions where their capabilities may be fully utilised. The other is to train youths lacking in such ability so as best to fulfil their function as workmen. In the efficient training of the latter two requirements must be provided—manual experience and trade instruction

be provided—manual experience and trade instruction.

With regard to trade instruction, the evening technical classes available in most industrial centres are quite unsuitable. Such education should be made directly applicable to the trades of the district, and apprentices should be compelled by their completes attended abscent for quitable instruction.

able. Such education should be made directly applicable to the trades of the district, and apprentices should be compelled by their employers to attend classes for suitable instruction, which should preferably be arranged during the daytime.

The apprentice-school method of training offers many advantages, and the author is of the opinion that in this method will be found the solution of a great many of the difficulties connected with apprentice training.

As regards "engineering" apprentices, it is not so important that the training be arranged on such uniform lines in different works as in the case of trade apprentices.

Attention is directed to the value of scientifically-trained men in works organisation, and to the fact that except in isolated cases the technical colleges have neglected to give attention to this field of employment.

In connection with the training for all positions whether of a technical or non-technical character, the importance of securing the best possible material cannot be over-emphasised, and it is a short-sighted policy for employers to place any obstacle such as financial restrictions in the way of admitting promising young men to the industry.

As to the economic importance of training apprentices, money and service thus expended may be viewed in the light of an investment. Individual employers reap direct benefit

of an investment. Individual employers reap direct benefit due to the fact that trade apprentices, as a result of careful training, mature at an earlier age than those not so trained. Also, owing to their ability to read drawings and make shop calculations, they require less supervision and assistance from their foremen

As to the industry generally, improved labour would have a favourable influence in international competition. The development of each worker to his greatest efficiency and usefulness would be a national gain.

### THE ELECTRICAL EQUIPMENT OF A COUNTRY HOUSE.

BY FREDERIC H. TAYLOR, A.M.I.E.E.

(Abstract of paper read before the Junior Institution of Engineers on February 19th, 1915.)

The importance of the electrical equipment of a country house can hardly be over-rated. Although perhaps the greatest duty entrusted to electricity in the house is lighting, it is called into service over many others, such as: heating, motor drives for domestic machinery, electric bells and tele-

phones.

Plants operated by paraffin engines represent by far the largest part of the installations of the last few years. They are obtainable from 1 to about 12 kw., by a host of makers, and generally are very reliable in character. The paraffin and generally are very reliable in character. The paraffin-electric set, together with the use of metal filament lamps, has entirely revolutionised country house lighting, both as regards prime cost and running cost. Such a plant can be put into the hands of unskilled labour and yet be relied upon to

into the hands of unskilled labour and yet be relied upon to give satisfactory results.

Many people urge that the most economical voltage to employ, except for large houses, is 25 or 50, but 10-watt 100-volt lamps with a satisfactory life can now be obtained, and cases where 50 volts is to be preferred are now few in number. Where current is required for heating, or motor driving, 100 volts becomes virtually a necessity.

The complete plant consists of a paraffin engine, coupled to a dynamo, the engine being started up on petrol, and afterwards switched over on to paraffin. For a small set giving only 3½ to 4 kilowatts, such as one would use for a house containing about 140 lights, a consumption as low as 1.6 pints of paraffin per kilowatt-hour can readily be had. In a case now before me of this size the cost for fuel will work out at something like 5s. per week during the winter months. The dynamo is almost exclusively used for charging a battery of accumulators. When a new house is to be built the space allotted for the electric plant is usually of the very smallest possible dimensions. The placing of a plant in a very confined space cannot produce the greatest efficiency of working. Another common mistake in the lay-out consists in the con-

Another common mistake in the lay-out consists in the con-Another common mistake in the lay-out consists in the connection between the engine room and battery room by means of the main switchboard. Many electric contractors and architects have a hole left in the wall which divides the engine room from the battery room, the main switchboard being recessed into this. Two results may follow. One is that the acid fumes from the battery have free access to all the bare copper and brass connections of the switchboard, and the other is that, with a view to meeting this point, the back of the switchboard is sometimes boxed in with woodwork so as to form a shallow cupboard, to receive later on various as to form a shallow cupboard, to receive later on various odds and ends, and thus provide a good opportunity for fire.

However small the plant may be, the switchboard should be kept absolutely in the engine room with a clear 18 in. space at the back. The battery stands are often only made about 18 in. high, the result being that the cells rarely get properly examined. Preferably, the cells should be on a stand

of a height to allow for convenient and ready inspection, say, 2 ft. 6 in. to 3 ft. high.

Usually mains have to be run from the engine room to the cusually mains have to be run from the engine room to the house, and are laid underground. For some reason, contractors usually favour V.I.R. conductors drawn into a screwed pipe, these conductors being sometimes lead covered. Care and experience is required in this class of work, the usual cause of trouble being a pipe line laid without a proper fall or any means of drainage, or the lead sheathing not being properly earthed, even if earthed at all, with consequent risk of corrosion and subsequent breakdown of corrosion and subsequent breakdown.

of corrosion and subsequent breakdown.

In country houses requiring only 50 to 80 lights, the main conductors which feed distribution boards can readily be run in pipe work chased into the main walls. In houses of larger size sometimes the architect provides a small trench, which runs right round the house, to contain the electric mains as well as the pipes required for the other services. Usually it is too limited in size, and often the hot and cold water services are so mixed up with the electric pipe lines that the latter are apt to suffer. A separate trench should be provided for the electric work only.

The mains between the engine room and house cheefed here.

The mains between the engine room and house should be

fused at each end.

Generally, there should be at least one distribution board Generally, there should be at least one distribution board for each floor, and the lighting fed from any board should be limited to the one floor or part of the house which it is intended to serve. The tendency is for the distribution board system to be much too limited and one has noticed, for instance, a small country house carrying about 100 lights fed entirely from one 10-way distribution board.

The wiring system mostly favoured, particularly for new property, is some class of pipe work, and in this grave errors are often made. A notable instance is the use of slip-socket tube laid under plaster work, which is objectionable. If welded or other absolutely closed tube is used, the point most commonly omitted is the proper earthing of all metal work. Many contractors altogether ignore the question of voltage drop, so that when a small proportion of the lights are turned on or off a visible jump occurs to the lamps remaining on

on or off a visible jump occurs to the lamps remaining on.

Tests properly carried out are mostly conspicuous by their absence. Not only should the work be tested on completion, but also at regular intervals afterwards, either quarterly, half-yearly or yearly, and a proper record kept of the results. The earthing should be tested as well as the insulation resist-

Great conveniences can be obtained by proper methods of switch control, commonly known as 2-way and intermediate switching, by means of which a lamp or lamps can be turned "on" or "off" from any one of 2, 3, or more positions regardless of how the switches may have been left at the other receiting.

positions.

These switches have been almost entirely developed by one firm (Messrs. A. P. Lundberg & Sons), to whom very much credit is due for the good results obtained. The art of multiple-way lamp switching has now become quite a big

The automatic time-switch is of great advantage in securing economy in the use of electricity in the servants' quarters, where, unfortunately, waste will most freely occur. An ordinary lamp switch should be provided to short-circuit the automatic switch in case of emergency.

The scientific treatment of illumination is of great importance, but a compromise has to be struck, and in most cases the scientific treatment has to give way entirely to the so-called artistic tastes of those who will use the rooms. Certain cardinal points can often be adopted if one is tactful enough to avoid too much specific reference to them when advising the user.

Illumination tests are of immense value, practically as well as scientifically. Generally, the illumination must be somewhere between 1 and 2 ft. candles, but for local illumination, such as the dining table or the dressing table, more like 4 ft. candles are requisite, some persons preferring even 6, and for such a special purpose as the billiard table 12 to 15 ft. candles are considered more appropriate.

The Holophane Lumeter is exceedingly useful in taking measurements of illumination and for other photometric work.

### ELECTRICITY APPLIED TO MINING.

By C. P. SPARKS, M.I.E.E.

(Abstract of paper read before the Institution of Electrical Engineers, February 25th, 1915.)

Progress during the last nine years has been so substantial that, in addition to the conversion of a large proportion of existing plant to electric drive, modern collieries are now entirely driven by electricity.

The present paper deals principally with the development of electric driving in the Powell Duffryn Collieries, which are raising coal at the rate of about four million tons per annum.

raising coal at the rate of about four million tons per annum. In 1905 the author described the Aberdare section of the Powell Duffryn undertaking, the power house then having a capacity of 3,000 killowatts, the rating of the motors connected totalling 4,500 killowatts, the rating of the motors connected totalling 4,500 killowatts, and the annual output being 4½ million units. The plant now in use by the company in the Aberdare and Rhymney Valleys is rated at 24,000 killowatts, the motors being of 44,500 killowatts, which represents something like 60 per cent, of the total power requirements. The output during 1914 was about 50 million units, and the estimated output for

being of 44,800 B.B.P., which represents something like 60 per cent. of the total power requirements. The output during 1914 was about 50 million units, and the estimated output for the present year is 62 million units.

The area worked by the Powell Duffryn Company is 16,000 acres. In the Aberdare Valley there are nine collieries, the distance from the power house to the furthest colliery being 24 miles; and in the Rhymney Valley six collieries, the distance of the furthest pit from the power house at Penallta being seven miles. The distance between the Middle Duffryn power house (Aberdare Valley) and Britannia Colliery (Rhymney Valley) is some nine miles.

After considering alternative advantages of main steam winding, the Powell Duffryn Company decided to drive the whole of the plant at the new Britannia Colliery electrically. The main winder house and the electrical equipment were erected before the sinking was started. The sinking was commenced in June, 1910, and the two shafts, each 22 feet in diameter, were sunk to a depth of 750 yards by September, 1913. This sinking was seriously impeded by the quantity of water met with, and for many months the continuous input for pumping alone averaged 1,000 kilowatts.

### System.

Aberdare Valley-3,000 volts 3-phase 50 periods, neutral carthed.

Rhymney Valley-10,000 volts 3-phase 50 periods, neutral earthed.

Transmission-Aberdare to Rhymney, 20,000 volts 3-phase 50 periods.

Individual drive—Larger motors, 3,000 volts 3-phase; motors below 50 H.P., 500 volts 3-phase; lighting, 110 volts single-

While no one system is completely satisfactory for every

while no one system is completely satisfactory for every form of drive, in the opinion of the author the 3-phase 50-period system is more flexible than any other.

When a supply is available from a power company it should pay individual collieries to purchase the electrical energy required, and so avoid adding to the already multifarious duties of the colliery management, the necessity of supervising an electric power station. Where, however, the requirements of a single colliery undertaking exceed the output of the smaller power companies, it is advisable for such undertaking to generate its own electricity supply.

The use of exhaust-steam or mixed-pressure turbines has increased the field for separate generation. In other cases, coke-oven gas is available, which can be profitably utilised. Provided that the amount of power be sufficient and the colliery suitably located, joint working with a power company should be mutually advantageous in both the above cases.

With the increasing frequency and severity of labour troubles in recent years, the advantage of installing generating plant for pumping and ventilation at each important centre has become of increasing importance. In the case of the Powell Duffryn Company this point has been met by erecting as stand-by plant the original reciprocating sets which have been displaced from the main power house by larger plant, so that power may be available in an emergency at each main centre.

The generating plant, aggregating 24,000 kw., is distributed

centre.

The generating plant, aggregating 24,000 kw., is distributed

Aberaman Valley.—Middle Duffryn Power Station.—One 5,000-kw. Escher Wyss-Siemens turbo-alternator; two 2,000-

kw. Eecher Wyss-Westinghouse turbo-alternators; and one 2,000-kw. Curtis turbo-alternator, all running at 1,500 r.p.m.; total rating 11,000 kw.

Rhymney Valley—Penallta.—Two 3,000-kw. mixed-pressure Westinghouse turbo-alternators at 1,500 r.p.m.; total rating

Bargoed.—Two 1,600-κw. Nuremberg gas engines driving A.E.G. flywheel alternators, and one 800-κw. set of the same type, running at 100 r.p.m.; one 2,000-κw. Fraser & Chalmers-Siemens mixed-pressure turbo-alternator at 3,000 τ.p.m.; total 6,000 kw.

Elliot Pit.-Two 500-kw. Fraser & Chalmers exhaust-steam

turbines driving Dick Kerr generators at 1,500 r.p.m.
At the Middle Duffryn power station water is drawn from the Cynon River, which has been damined to form a cooling pond.

At Penallta the only source of circulating water is the pit. Originally the circulating water was cooled by sprays over a shallow pond; owing to the difficulty of keeping this pond watertight, through settlement due to the workings, the pond

has been supplemented by two cooling towers by Messra. Balcke, each having a capacity of 330,000 gallons per hour.

At Bargoed an ample supply of water is available from the Rhymney River, and at Elhot circulating water is cooled in spray coolers, make-up water being obtained from the pit or the Rhymney River.

The largest turking unit at Middle Duffren power house is

the Rhymney River.

The largest turbine unit at Middle Duffryn power house is the 5,000-kw. Escher Wyss-Siemens set, which has been in operation about nine months. The turbine is of the Zoelly 12-stage type, steam being supplied at the stop valve at 150 lb. per sq. in. pressure with 100° F. superheat and exhausting to a vacuum of 95 per cent. The plant is governed by an oil relay controlled by a governor, which actuates a double-seated throttle valve. Overload to the amount of 20 per cent. is obtained by means of a by-pass valve actuated automatically from the main governor and controlling live steam admission to the fourth stage. The turbine speed is regulated from the switchboard. The alternator is star-connected, for working with the neutral earthed through a resistance, and has the exciter armature mounted on an extension of the main shaft.

exciter armature mounted on an extension of the main shaft. A fan on the rotor draws air from a wet-air filter through channels in the base of the stator and discharges it through an outlet in the top. The surface condenser, which has 12,800 sq. ft. of cooling surface, is immediately under the turbine; the turbine exhaust and the condenser are connected by a water-select dead.

the turbine exhaust and the condenser are connected by a water-scaled gland.

The condensing auxiliaries consist of three centrifugal pumps, driven by vertical shafts from motors of the induction slip-ring type. The circulating water pump is driven by a 140-H.P. motor and the air and water extraction pump by a 75-H.P. motor, air being extracted by a jet of high-pressure water forced by the centrifugal pump through the air ejector.

The motors are connected at the floor level, so that in the event of the basement being flooded the auxiliaries could still be run, any water entering the basement being discharged by the opening of a valve on the circulating-pump suction.

Exhaust steam from existing winders and compressors is

Exhaust steam from existing winders and compressors is utilised at the following collieries:—

		Maximum rate of flow per minute.	Average per hour winding shift.
Elliot		 	 50,000 lb.
Penallta	• • •	 2,600 lb.	 60,000 ,,
Bargoed		 2,000 ,,	 75,000 ,,

The first exhaust-steam plant was erected at Elliot Pit, and consisted of two 500-KW. exhaust-steam Rateau turbines and Dick Kerr alternators, steam being delivered from the main winders to two Rateau accumulators. The use of this plant is limited to the day shift, as it cannot be run efficiently on

live steam.

The second application was at Penallta, where the exhaust steam from the two main winders and a compressor is utilised through two Rateau steam accumulators in conjunction with two 3,000-kw. Westinghouse mixed-pressure turbo-alternators. The turbines are designed to give an output of 1,800 kilowatts with 60,000 lb. of low-pressure steam, and when working mixed pressure to give an output of 3,000 kilowatts with 60,000 lb. of low-pressure steam and 19,000 lb. of high-pressure steam at 150 lb. per sq. in., 100° F, superheat.

As this plant works in parallel with the gas-engine station at Bargoed, close speed regulation was necessary, otherwise the gas-engine plant would have been over-loaded each time the plant changed from high-pressure to low-pressure steam. The makers were very successful in this application, tests showing that the alteration of frequency when changing from high-pressure to low-pressure steam did not exceed 0.3 of a period. The interchange of load when the gas-engine station is working at an average load of 1.800 kilowatts and the turbine load is 2.000 kilowatts does not exceed 500 kilowatts.

The condensing plant for each turbine is designed to deal with steament the rest of 500 kilowatts.

bine load is 2,000 kilowatts does not exceed 500 kilowatts. The condensing plant for each turbine is designed to deal with steam at the rate of 80,000 lb. per hour, the surface condensers having a cooling surface of 15,000 sq. ft. The condenser auxiliaries consist of an auxiliary steam turbine driving a Leblanc air pump, a centrifugal cooling-water pump, and a condensed-steam extracting pump running at 2,000 r.p.m. The auxiliary turbine, which develops 150 B.H.P., exhausts into the low-pressure steam system between the accumulator and the main turbine. the main turbine.

(To be continued.)

#### WAR ITEMS.

Birmingham Electrical Volunteer Force.—The following is a copy of a circular letter which has been issued this week:—" It is our pleasing duty to acquaint you with the purpose and constitution of the Birmingham Electrical Volunteer Force which was formed in Birmingham last November. It is a serious attempt to organise on a military basis for the purpose of Home Defence, all those connected with the electrical and allied industries in Birmingham who for sufficient reasons—which must entirely satisfy the Combasis for the purpose of Home Defence, all those connected with the electrical and allied industries in Birmingham who for sufficient reasons—which must entirely satisfy the Committee of Management—are unable to join the Regular Forces of the Crown. It is recognised that the members of the electrical and allied industries possess high technical knowledge and skill which only require a course of military training to become mobile and capable of effective military application. This is the work we are now engaged upon. The force is fortunate in its military advisers and instructors, and the Committee of Management is composed of men who are prominent in local engineering circles. Two large drill halls are occupied three nights each week for manual training; dummy rifles and miniature range rifles have been purchased and a rifle range has been secured. The following sections have now been organised:—Air Line, Cable Line, Wireless, Signalling, Searchlight, Fortress, Works, Motor Transport, Electric Transport, etc. A room has kindly been placed at our disposal in the Central Technical School, where a series of lectures will be given on military engineering. It is hoped that the force will soon be 1,000 strong, and efficiently prepared to take its part in the defence of our country should the necessity arise. In order to make it easy for manual workers to join us, the subscription has been fixed at a nominal figure, and we have no hesitation in asking for your generous support of the movement, which so closely concerns us all. A sum of £1,000 is required immediately for the provision of the equipment necessary to enable the force to attain military efficiency. The War Office have decided that no grants will be given by them and that all volunteer corps must be self-supporting. Most of our members are working men who are not in a position to contribute more than the nominal subscription already fixed. In these circumstances and owing to the expensive nature of the equipment required for a technical force, it is essenti should be obtained.

should be obtained.

"The undermentioned donations have already been promised:—General Electric Co., Ltd., £100; Callender's Cable Co., Ltd., £100; Babcock & Wilcox, Ltd., £50; George Ellison, Esq., £50; W. & T. Avery, Ltd. (Automatic Dept.), £25; R. A. Chattock, £10; Donovan & Co., £10; S. R. Hare, £5; D. Shanks, £5.

"The Treasurer will gratefully acknowledge your donation."

Russia: Trade Routes.—In view of the existing difficulties in shipping goods to and from Russia, the following extract from an American report just issued will be of interest:—"Freight for Russia, which has been going into Archangel and thence by rail via Vologda to Petrograd, can probably not be landed there any more until next summer, because, notwithstanding all the efforts of icebreakers to keep the White Sea open, the harbour of Archangel is now reported to be frozen solid from two to four feet thick. As there is a great accumulation of freight now at that port awaiting rail transportation, it will probably not make much difference for several months. New interest is being taken in the all-rail route from eastern Scotland or England ports to Bergen, Norway, thence to Christiania, Stockholm, Boden, Tornea; thence south through Viborg to Petrograd. There is, however, a gap in the northern portion of this route. This reaches from Tornea to Karungia, say 15 to 20 miles. I met a man a few days ago who had just come over that gap. He said that there was good sledding, enabling freight to be transported now very easily in that manner. He said it took him six days to go from Petrograd to Stockholm. This route, however, ought to offer good attractions for shipment of American freight of any kind to Russia. American ships might run to Peterhead, Scotland, or to Newcastle, and thence to Bergen; or they might, of course, run direct to Bergen. It is reported that a new steamship line is arranging to run between Stavanger, Norway, and some point in England. No doubt this service could be utilised for a certain amount of American package freight, shipped primarily to Liverpool, and going over this route to Bergen for the all-rail route to Russia. In making arrangements for handling this new Russian traffic it is well to remember that our trade with Sweden is rapidly increasing, and the same arrangements for carrying through Russian traffic could be utilised for this growing Swed

remember that our trade with Sweden is rapidly increasing, and the same arrangements for carrying through Russian traffic could be utilised for this growing Swedish business."

A New Veto on German Electrical Exports.—A further extension of the many existing prohibitions has now been made by the German Government by the imposition of veto on the export trade and transit trade in the following classes of electrical manufactures:—(1) Dynamos, motors, converters, transformers, choking coils, and complete armatures and commutators if they are intended for ships, search-

lights and installations for wireless telephony and tele-graphy; (2) copper wire, cable and strands, aluminium and alloys of aluminium, plain or covered and with or without alloys of aluminium, plain or covered and with or without an outer metallic armouring; also flexible insulated wires of short length which, as component parts of electric lighting manufactures, are connected with these, or which are provided with contact devices at both ends; (3) searchlights and their constituent parts, excepting so-called projector lanterns; (4) carbons; (5) contrivances for telephony and telegraphy and for wireless telephony and telegraphy, including component parts, excepting telephone, walk and table installations; (6) telegraph standards and other masts for conductors, made of wood; (7) those component parts of installations of conductors for telephony and telegraphy, which in themselves are not subject to prohibition, if they are intended for such installations; (8) pocket lamps, hand lamps and torches and the batteries and accumulators suitable for them, and constituent parts of the same; (9) glow lamps and their component parts; (10) special apparatus for able for them, and constituent parts of the same; (9) glow lamps and their component parts; (10) special apparatus for the transmission of orders and compass movements, and their constituent parts; (11) mines and ignition apparatus, together with magnetos; and (12) all electrical products not specially prohibited, if they are goods which fall under the veto on imports, exports and transit trade from the standpoint of their material nature or according to their use.

Thermit, Ltd.—We have been asked to publish the following statement:—"By order of the High Court upon application by the Board of Trade, I have been appointed Controller of Thermit, Ltd., as it appeared to be in the public interest that the company's business should be continued without interference. In view of my appointment, which does not in any way reflect upon the management of the company in this country, as was stated by country for the company in this country—as was stated by counsel for the Crown in open court—I am in a position to assure you that no moneys or profits will reach the alien enemy sharethat no moneys or profits will reach the alien enemy shareholders of the company. As regards the patents, the Board of Trade have decided to avoid two patents belonging to the company, viz., Nos. 10,859/01 and 24,439/02, the first of which would, in any case, have lapsed in about three months from now, and the second about a year after. The company, however, do not regard the loss of these patents as a very serious matter, as for modern practice welding they rely on a number of subsequent improvements, besides certain secret knowledge which will enable them to deliver certain secret knowledge which will enable them to deliver material of exactly the same welding properties as they have hitherto supplied. All materials, etc., required for rail

material of exactly the same welding properties as they have hitherto supplied. All materials, etc., required for rail welding are manufactured in the company's works, at 675, Commercial Road, London, E., and both the office staff and workmen employed are exclusively of British nationality.

"Hudson, Smith, Briggs, Smith & Taylor,

"Chartered Accountants,

"London and Bristol."

Glow-Lamp Manufacture in Holland.—The annual report of Philips Gloeilampen Fabrieken, of Eindhoven, which is one of the largest works in the world, is stated to show gross profits of £208,000 for 1914, as compared with £149,000 in the preceding year. It is proposed to appropriate £60,800 for depreciation of machinery, as against £54,000 in 1913, and £28,000 for depreciation of works and buildings as contrasted with £24,000, and to set aside a further sum as provision for war risks in relation to debts owing to the company. The balance of net profits amounts to £106,000, as against £66,000 in 1913, and the directors to £106,000, as against £66,000 in 1913, and the directors recommend dividends of 7 per cent. on the preference capital of £187,000, and 11 per cent. on the ordinary capital of 2291,000, and 11 per cent. on the ordinary capital of £291,000, being the same rates as in the previous year. As compared with the total capital the balance sheet is noteworthy from the standpoint of the large amounts allocated to depreciation, and from the holding of £295,000 in cash, first-class securities, etc., as against £138,000 in 1913.

The War Office and Messrs. Siemens.—A question was asked in Parliament on Monday, by Mr. R. Gwynne, with reference to the placing of War Office contracts with Messrs. Siemens. In reply, Mr. H. Baker said that such contracts were given to the firm named, and he was aware of the constitution of the board. The firm employed a very large staff of British workers, and had given an undertaking that no part of any payments received on War Office contracts would be transmitted to enemy shareholders. He was informed (savs the "Times" report) that there were no British-owned firms not already engaged on Government work who were capable of undertaking the contracts which this firm had received. In the circumstances, he did not think it was in the public interest to dispense with the firm's services. He believed it was an absolutely trustworthy firm. If Mr. Gwynne, and indeed every other member of the House of Commons, were to read the Electrical Review, the time of Parliament now spent in answering unnecessary questions would be saved.

Coal Prices.—Coal merchants have given notice to Dar-

Coal Prices.—Coal merchants have given notice to Dar-**Coal Prices.**—Coal merchants have given notice to Darwen Electricity Committee that, owing to the reduction of the output of coal through workmen enlisting, they are compelled to reduce the supply by 25 per cent., and that any coal delivered over 75 per cent. of the contract quantity will be charged at the rate of 1s. 6d. per ton above the contract

More Diabolical Ingenuity of the Enemy.—In the "Wireless World," it is stated that the German trenches

are being protected by barbed wireless. Terrible havoc has been wrought through our troops marching into it without seeing it.

out seeing it.

Signal Service 1st London Divisional Engineers.—A third Signal Company will shortly be raised. Applications to enlist are required from young well-educated electrical engineers or electrical engineering students. Applicants should possess a practical working knowledge of some branch of the electrical industry or have studied at some technical institute. The work of the company being of a highly technical nature, the experience gained after some months' service renders a man better qualified for appointments in civil life. Most of the men are mounted, but those unable to ride will be taught. The pay and allowances are at the special Royal Engineers' rates, with separation allowance to dependents. Applications for enlistment should be made, in the first place in writing, to the Recruiting Officer, c/o O.C. 2/1 London Divisional Signal Company, 10, Victoria Park Square, Bethnal Green, E. Park Square, Bethnal Green, E.

Park Square, Bethnal Green, E.

Uruguay-German Enterprise.—In a recent report to his Government the American Consul at Montevideo states that German competition in that market is still an important factor, though at the beginning of the war it was generally assumed that German trade with South America would be practically suspended. There was an ample supply of German manufactured articles in Montevideo at the beginning of the war, and goods shipped from Germany since the war started are stated to have been offered in Uruguay at competitive prices. The German importing houses and industrial enterprises in the country are expected to serve as effective bases for trade operations after the war, as they did before, and the Germans are quietly making necessary preparations for re-establishing their old business and trade relations as soon as peace is declared.

preparations for re-establishing their old business and trade relations as soon as peace is declared.

Australia and German Trade.—From various reports to hand it is apparent that the movement in Australia for avoiding future trading with Germany, and giving substantial preferential treatment to British and Allied countries, is gathering force. A permanent transfer of trade connections from Germany is what is being aimed at, and statesmen and others are not hesitating to say that whatever may have been their views in the past, the war has taught the necessity for considering our own people first. necessity for considering our own people first.

necessity for considering our own people first.

War Bonus.—The Potteries Electric Traction Company have intimated that men in their employ will receive 2s., and boys 1s., weekly bonus while the war lasts.

Personal.—Included in the first batch of English wounded prisoners exchanged for German prisoners, were Private J. Hopwood, of Astley Street, Dukinfield, and Private Willie Edwards, of Hurst, both of whom were up till recently employed at the Tudor Accumulator Works at Dukinfield.

Accrington Electricity Committee, after considering what to pay Captain Gray, the chief electrical engineer, during the time he is serving in the new Howitzer Brigade, recommends the Council to supplement the captain's army pay by such sum as will make it equal to his salary as chief engineer, and to continue such a rate of payment during the war.

Mr. Wilfrid Gonde, electrical engineer, of Alverston (Lancs.), has joined Kitchener's second army, being recruited at Cambridge.

Roll of Honour.—Sergt. Stephen Gilbert (24), of the King's Royal Rifles, formerly employed at the United Electric Car Works, Preston, has died at Gustrow, Germany. Wm. Hy. Hunt, a private in the Royal Marine Light Infantry, a former employé of Blackpool and Fleetwood Tramroad Co., is stated to have been among the crew of the armed liner "Clan McNaughton," reported by the Admiralty to have been lost with all hands.

#### The Government and Foreign Trade.

The Government and Foreign Trade.

Referring to your remarks under this heading on page 848 of your issue dated December 25th, it is with great satisfaction that this Committee has seen this matter taken up by such an important institution as the British Engineers' Association.

This Committee, although formed for the express purpose of sending home volunteers for Lord Kitchener's Army, has also been giving attention to trade questions, and this matter has been under study for some time. We are entirely in agreement with the chairman of the British Engineers' Association that reforms are required in the Consular service if British trade is to be properly looked after in the future.

A great many instances could be cited from this country alone to show how British foreign trade has been neglected in the past,

to show how British foreign trade has been neglected in the past, and it is the hope of this Committee that some measures will be taken that will ensure the proper attention being given to

this very important matter.

We have no hesitation in saying that the need for reform is felt by Briti-b trade throughout the world, and advantage should be taken of the present patriotic awakening to ensure that we do not fall again into the state of indifference existing before the outbreak of war.

Small British communities abroad can do yery little more than appeal to those at home, and we trust that all the important journals, such as the ELECTRICAL REVIEW, will take this matter up seriously, and put it before the public authorities in such a way that it will be thoroughly inquired into and dealt with without delay.

Wm. Johnston, M.I.E.E., Hon. Secretary, British Patriotic Fund.

Santiago, January 28th, 1915.

#### Consulting "Engineers."

I think "Station Engineer" has voiced a complaint that does need immediate attention, but he does not go far enough, for what about cases like this (I can vouch for it). There is a large institution, having extensive works up and down the country, where the chief engineer has never been inside a works in his life, has absolutely no practical knowledge, and could not even point out with any degree of certainty which is the positive terminal of a Leclanoné cell. This "engineer" has the preparation of schemes and specifications for electrical and mechanical work. The contractors know this, and have a good time at the firm's expense, for work is not inspected by an engineer who knows his jub, although there are some in the office who do, and it is thanks to these men that he is able to "get through." Could nothing be done to make it necessary for positions like these to fall to men who have qualified for such? for there are many who have spent years and a fortuge in training.

#### Batteries for Electric Vehicles.

Perhaps you would be good enough to find space for some comments of ours on the recent article appearing in the Commercial Motor on the "Choice of a Battery." As pioneers of the commercial electric vehicle in this country, we naturally feel astonished that after the Edison accumulator has been on the

astonished that after the Edison accumulator has been on the market for seven years it should be possible for the writer of the article in question to fall into so many serious errors of fact.

First, concerning some of the Commercial Motor's general statements. The lead battery is certainly not the more popular one for electric vehicles in Great Britain, as there are, in fact, about 90 per cent, of all the commercial electrics in this country confirmed with the Edison accumulator as against 10 per cent. equipped with the Edison accumulator, as against 10 per cent. with other types.

One concern alone will shortly have nearly 50 Edison accumulator vehicles, having started only about two years ago with a single van. There should be no special difficulty in deciding what type of battery to employ, if it is required to run an electric vehicle at the least possible expense. Where an electric vehicle is in constant and reasonably vigorous service, we assert that the Edison accumulator offers the nearest solution to the problem of economy. Our reasons in support of this statement we have adduced on numerous occasions, and we shall be willing to quote

adduced on numerous occasions, and we shall be willing to quote actual figures, which we would guarantee for a given set of conditions, to any bone fide inquirer.

Referring to lead batteries in general, it is a fact that no lead battery whatever, excepting the "Ironolad" Exide, is sold with a guarantee in this country. As a battery is mentioned which is sold with a guarantee of two years, we conclude that this one must be the "Ironolad" Exide. The guarantee in this case warrante 80 per cent. of the rated capacity after two years' service. The majority of lead batteries will not give more than from 8,000 to 10,000 miles service, under commercial conditions, and even then must be exceedingly well looked after during the whole of their lifetime, to prevent the injurious sulphation, which, at very alight provocation, will quickly ruin such batteries.

The next statement is unprecedented in our experience of the many extremely inaccurate statements that have appeared, with regard to the Etison accumulator. It should be well known by now that the inherent chemical principle on which the action of the Edison cell is based, preserves it completely from all but the

the Edison cell is based, preserves it completely from all but the slightest traces of deterioration on op-n circuit, and that, therefore, the Commercial Motor's statement that "the Edison must of necessity be replaced at the end of four years, whether it has been used or not "could not be more inaccurate. In point of actual fact, the Edison cell is warranted, without reserve, for electric vehicle service, that after four years' daily operation in a commercial electric vehicle, it will give 100 per cent, of its normal rated output and efficiency, and will, moreover, during the interim cost nothing whatever for mechanical repairs—that is, no plate renewals or upkeep. If the Edison cell be allowed to remain on open circuit, then the amount of deterioration that occurs is nil; if only used for a few cycles of obarge and discharge per annum, its life will undoubtedly be indefinite, running, perhaps, into 40 or 50 years, though this cannot be positively proven by quoting practically-derived figures, as the modern type of Edison cell has

practically-derived tigures, as the modern type of Edison cell has only been commercially available for seven years.

Concerning life, we do, however, positively know that in cases where Edison accumulator-equipped trucks have been in service five years, having run 50,000 miles during that time with the same set of batteries, the latter have shown no signs of depreciation below their normal capacity, but have on the contrary given below their normal capacity, but have, on the contrary, given more than 10 per cent. above rating at the end of this period. Is above rating after four years, which shows 10 per cent, above rating after five years? The Adam Express Co., in the United States, which has 800 of its cars equipped with the Edison accumulator, could and would, no doubt, give some first-hand information on its reasons for choosing this type in preference to

others which, as the Commercial Motor's article states, should for all-round work be the better proposition.

It is quite true that most lead accumulators maintain their voltage better on very high rate discharges, that is, when going up hill, but against that must be set the fact that especially towards the end of discharge, it is extremely detrimental to the lead type of cell to take high currents therefrom, as this causes not only buckling of the positive plates and shrinking of the negatives, but also severe sulphation, unless the cells be charged soon after receiving such maltreatment. Contrast this with the nickel-iron Edison cell, which may be completely short-circuited and left out of commission, should that be necessi eary, for an indefinite period, without being in the least harmed thereby.

Referring to weight, the annexed table indicates the ratio of

weights of the Edison cell, compared with two of the best known makes of lead accumulators. These figures are taken from data supplied by the manufacturers themselves, through the medium of the Electric Vehicle Association.

Make of battery.	Rated xwhr. output.	Gross weight in lb.	Weight in lb. per xwhr. at rating.	Excess of weight over Edison type.
Ironolad	10.6	1,350	127	53 % 28 %
El. S B. Co. thin plate	12.8	1,350	105	28 %
Edison A-4	108	900	84	_
Ironolad	13.3	1,620	123	50 %
EJ.S B.Co. thin plate	17.1	1,720	100	50 % 22 %
Edison A.5	13.2	1,100	82	
Ironolad	18.2	2,200	119	45 %
El. S.B. Co. thin plate	21.4	2,100	98	19 %
Edison A-6	16.3	1,260	78	-
Ironolad	23.8	2,750	115	40 %
El.S.B.Co.thin plate	27 8	2,650	96	17 %
Edicon A-8	21.6	1,820	84	-
Ironolad	26.4	8,080	117	43 %
El. S.B. Co. thin plate	32.1	3.080	96	43 % 17 %
Edison A-10	27.0	2.250	84	_
Edison A-12	82'4	2,700	84	_

NOTE.—The weight characteristic taken above for the Edison cell is a conservative figure of 82 lb. per kw.-hr. In actual practice this is generally considerably less, vis., about 75 lb. per kw.-hr.

As to re-charging, although the constant-potential method, involving a steady pressure of 2.3 volts per cell, is frequently advocated by the lead-battery makers, and is, no doubt, very good for ensuring the longest possible life of this type, it should not be forgotten that the procedure is a lengthy one, taking from 11 to 13 hours, and even then does not achieve a complete charging effect, it being necessary to supplement the constant-potential charging by over-charging once a week or thereshouts. Moreover, the lead type of cell, without exception, is not improved by boostthe lead type of cell, without exception, is not improved by boosting, carried out under conditions such as generally obtain in every-day service. That is, boosting must be kept below the rate at which violent gassing is produced, else the lead type of cell is greatly injured thereby and its life reduced. With the Edison cell, gassing is unimportant, from a destructive standpoint, and merely signifies the wasting of a small amount of current. In fact, boosting rates are possible with the Edison cell, which would after may six months, service reduce the majority of lead cells to a after, say, six months' service reduce the majority of lead cells to a heap of lead oxide in the bottom of their containers.

From the above it is clear that the actual service life of the Edison cell may be expected to be far in excess of that indicated by

the guarantee period.

Further advantages in favour of the Edison cell lie in its perfect immunity from the effects of long-continued mechanical vibraimmunity from the effects of long-continued mechanical vibilition and the consequent injury occasioned, not only to the plates, but to the containers. Obviously a container made of rolled steel plate with a welded seam is a better mechanical job than any should or rubber compound container could be. Moreover, and ebonite or rubber compound container could be. Moreover, the Rdison cell uses a steel-preserving electrolyte, in the place of acid, thus eliminating a whole train of minor di-advantages which often prove a great nuisance under practical conditions. Anybody who has "suffered" from sulphuric acid will agree hereauent.

who has "surered "from sulphuric acid will agree nereshent.

Whilst the general upkeep of the Edison cell involves merely charging as and when required, and the occasional addition of distilled water, together with the simple precaution of not allowing the exterior of the cells to become dirty and wet, the procedure in the exterior of the cells to become dirty and wet, the procedure in the case of the lead battery is relatively complex and includes a large number of "don'ts" and precautions which may be completely ignored when operating a steel battery. It is also simpler to determine the state of charge and discharge of an Edison cell, since it is a property of the nickel-iron type that its ampere-hour capacity is more or less constant, within practical limits, at all rates; energy withdrawn from an Edison battery may be determined merely by measuring the ampere-hours withdrawn by means of an integrating ampere-hour meter. If this instrument be set to run slower on charge, by an amount slightly exceeding the difference between 100 per cent. and actual ampere-hour efficiency, then the readings of such an instrument represent hour efficiency, then the readings of such an instrument represent safely, at any given moment, the state of charge or discharge of the battery, and no considerations as to voltage, &c., are necessary. An Edison cell is quite unharmed by being discharged to complete exhaustion. It may be left in that state for long periods, and does not suffer in consequence.

We are, of course, prepared by all the usual means to justify the remarks made in this communication, and shall be glad at any time, either personally or through the Press, to substantiate the

claims which we herewith make.

For Edison Accumulators, Ltd., RAYMOND J. MITCHELL, Commercial Engineer.

London, S.W., March 1st, 1915.

#### Trouble with Oil.

Referring to the letter of "Inquirer," in your issue of February 26th, re a 1,000-KW. D.O. set driven by a Belliss & Morcom engine throwing oil, a few months ago we were experiencing the same trouble with a set of the same make. After having come to the same conclusion as "Inquirer," that the oil was carried in in the form of vapour, and after trying endless devices for preventing the collection of oil in the armature, the idea of a fan was struck

An out-throwing fan driven by a 1½-H.P. motor was fitted in the wall about 14 ft. above the top of the engine cylinders, and 8 ft. away, which gave excellent results.

The set has been running on and off for the last 12 months, and for the last 9 months we have had no trouble with oil collecting or

eeping, and the shaft is always perfectly dry.

It is obvious that in the construction of large modern dynamos, the ventilating air-space being so large, a set running at 250 to 300 B.P.M. will create a vacuum inside the armature, and draw in oil vapour from the engine room, which is thrown up through the armature windings, thus forming, if allowed to remain, a thick coating of grease and dust.

Trusting that this information will be of some use to "Inquirer."

Charge Engineer.

Referring to the letter of "Inquirer," I experienced a similar difficulty some little time ago on a somewhat smaller set, and found that the trouble was caused by oily vapour from the H.P. glands of the engine. This vapour rose above the engine, and ultimately was drawn into the generator at the commutator end. The difficulty was overcome by fitting new packing, and by careful attention being paid to the glands.

W. H. R.

#### Electric Light Switching.

The results of the electric light switching competition, published in last week's issue of the electrical Press, make

interesting reading.

There is one outstanding feature, however, which illustrates how the "art of switching" is coming to the fore not merely as a novelty but as a means of efficiently controlling various electrical apparatus—that the various Polytechnics are giving greater attention to the subject.

The recent list contains the names of no fewer than 17 students of the South-Western Polytechnic, who have succeeded in gaining between them one cash prize, five book prizes, and 17 certificates.

East Ham Technical College students obtained one book prize

and three certificates.

W. E. S.

#### Writer's Cramp.

I shall be very much obliged if any reader can advise me regarding the proposed use of an electrically-operated massage vibrator or induction coil or continuous-current battery, in the following case:—One of my clerks, who for some few years past has had to confine his handwriting during office hours largely to signing his own name and initials, now experiences some pain in his wrist when writing—whether it be his name or an ordinary letter. His hand twitches so much at times that it is frequently

difficult for him to sign his name neatly.

I understand that electrical treatment has been found of much use in cases of this kind, and if anyone could state from experience the result of such treatment by either of the means suggested above, it would be very greatly appreciated.

## FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

-A decree of December 4th, 1914, effective from January 1st, 1915, increases the river tax on goods transported on the Magdalena River between Barranquilla and the interior of Colombia. The new rates are \$4 in place of \$2 per metric ton (2.204 6 lb.) on imports, and \$1.60 instead of \$1 per ton on native exports. In view of this increase in the river tax and the fact that Customs duties in Colombia are collected on gross weight, whinners to the interior of Colombia are collected on gross weight, shippers to the interior of Colombia will see the advantage of combining lightness with strength in the packing of their merchandise.

SPAIN.—In a cablegram to the United States Governments from Madrid dated January 27th, Commercial Attaché C. W. A. Veditz, of the American Department of Commerce, reports that on that date the Spanish Government appointed a new tariff Commission to prepare for tariff revision. It is provided in the Customs tariff law of Spain that the rates of duty shall be revised every five years, in order to take into account the changes in the values of merchandise on which the duties are based. The latest revised tariff became effective on January 1st, 1912, and it is assumed that the revision entrusted to the present newly appointed Commission will go into effect five years from that date.

#### EDUCATION AND INDUSTRY.

FROM the Times of February 22nd we learn that the Board of Trade has authorised an Exhibition to be held in London with a view to "a more scientific co-operation between education and the industrial arts in this country." This has been done at the instance of a body of men, among whom are Lord Aberconway, Mr. Frank Brangwyn, the artist, Mr. F. V. Burridge, of the Central School of Arts and Crafts, Mr. H. G. Wells, Mr. Gordon Selfridge and Mr. Ambrose Heal. The Exhibition is intended, we gather, to show, as an object lesson to ourselves, how German manufacturers have used the Art Schools of their country to train designers for their particular needs, and have taken steps at the same time to educate public taste and discrimination. In recent years we have seen in this country such a process carried out with great energy, and conspicuous success, by the great furnishing firms. Specimen room, and in some cases suites of rooms representing whole houses, have been shown by leading firms, and everyone went to the Ideal Home Exhibition. No one could help seeing there what great judgment and care were required for much of the exhibit, and the general taste and appreciation of the purchasing public has much improved in every direction in late years. We believe this country is now recognised as leading the world in the furnishing trade, and this must be attributed to the action of the manufacturing firms in developing artistic design parallel with skilled workmanship and efficient manufacturing.

The process can be carried out to a greater or less degree in a great number of trades, and the proposed Exhibition will show that German thoroughness has introduced it into trade manufacturing to an extent which few of us would suspect. We look forward to the Exhibition with great interest, and hope that the results may fully answer the expectations of the promoters.

This proposal deals, however, with but one section of a greater question. How are we to rearrange the educational system of the country so that school training shall be part of an ordered and intelligible process, by which a child grows into an efficient and capable worker? The question has been discussed more than once in these columns, and is the crucial problem of national education.

The main scheme of our educational system is far from being closely in touch with trade and industry. Indeed, these hardly come into the picture at all. There is no difficulty in accounting for it. The history of the civilisation of Europe is a sufficient account. But while we have allowed the matter to run on in the groove in which our ancestors started it, Germany has known how to set a wiser course, and has been reaping the advantage of her wisdom. The result is that in this country the secondary schools implicitly, if not explicitly, present to their pupils as the object of training, mental cultivation of the literary and scientific kind, while the ideals of industrial enterprise are not presented at all. The instruction given at our great public schools and the Universities is really not wide enough for

Digitized by Google

all modern purposes. If one were to tell a man who had built a successful career on the basis of such education, say one of the Judges, or a young Bishop or headmaster, that the scope of his instruction had been extremely imperfect, he might be surprised; he might even be rude; but the fact is that while English public schools are admirable places for learning manners and conduct, and the ars vivendi, their instructional curriculum is very narrow. This may not be a serious matter, having regard to the class from which the boys come; indeed, for their purposes the curriculum is probably wide enough, but it is not wide enough for other schools; and what is serious is that they, unluckily, set a pattern and standard to the schools for the middle and upper working classes which is quite unsuitable and is extremely mischievous.

We expect that this promised exhibition will emphasise once more the necessity in this country for an extended system of secondary schools, organised with a clear purpose

of industrial training.

#### RUSSIA.

VARIOUS reports and other communications that have lately reached us from Russian sources bear evidence of the great desire that exists among electrical men in the leading cities of that vast Empire to throw off the German yoke and avail themselves of British electrical manufacturing facilities. The new bond of Russo-British friendship will hold good for many a year, and one of its consequences will be to furnish us with opportunities to assist in the electrical and engineering development of a wonderful field for enterprise; but, at the moment, sheer necessity presses, because German sources, upon which so much dependence has been placed for electrical goods in the past, have been closed for many months. From what we have already read and heard of the efforts that our Russian electrical friends desire to make for removing German influences and control, we are led to hope that they will, as time passes, exhibit in this connection the same determination and resourcefulness which have distinguished the military operations of the Grand Duke Nicholas and his dauntless millions.

We believe, too, that when the Czar's Government comes to deliberate seriously respecting the regulation of matters relating to internal industries and to export and import trade, it will not be found wanting, but will be prepared to render assistance to electrical and engineering works and traders in such ways as shall facilitate the operations of the Allies in competition with present enemies. These enemies have been enabled to prepare to wage this terrible warfare partly by securing profits to the tune of many millions per annum from electrical concessions and trade in the country whose deep-snowed lands have now been dyed in human blood. This Governmental assistance, however, is hardly a matter of immediate possibilitywill doubtless develop a new and sweeping international trade policy in due course, and we may reckon that, as far as practicable, that policy will be favourable to ourselves and our Allies, and perhaps some neutrals. When that time comes, probably, the present projects of British electrical manufacturers will have been carried to such a stage that will be enabled to co-operate from present and extended manufactories. But at the moment, all information is to the effect that, as we have said, sheer necessity for electrical supplies urgently presses. The difficulties that stand in the way of immediate electrical trading operations between us seem to be very great, but the proceedings in the Dardanelles give ground for encouragement, for, when these are successful, providing there is shipping accommodation available—a point which is not likely to have been lost sight of by those responsible for the approach through the Narrows there will be a free flow of exports and imports again which will inevitably relieve the financial situation and

remove or lessen the rate-of-exchange difficulty. British exporters no less than Russian importers are hoping for this relief to come as speedily as possible; until it does come there must, we suppose, be a continuation of the handicap on trading operations, though we trust that our firms will not be too hurried in turning down the business which is actually offering. We are well aware that our manufacturing ability is to a large extent monopolised by Government demands, and that there is a certain amount of shyness or wariness in relation to the Russian market, but it will be fatal to any schemes that we may cherish for later trade developments if we allow Russian buyers to get the impression that it is useless for them to expect to get what they need from British works. We ought to do our utmost to prevent them thinking either that we can't, or don't want to, do business with them. If such ideas be permitted to gain currency, sheer necessity, when the War is over, will drive them, sentiment notwithstanding, to deal with enemies that are geographically near and have laid themselves out to meet Russian electrical requirements.

It is such considerations as these that should seriously be weighed by us in organising our efforts to "capture" German trade in the Russian market. It is for the future to decide what course the Czar's Government will see fit to adopt, and what course financial settlements will dictate, in regard to German electrical concessions and works in Russia. Ownership of concessions, in German hands at any rate, generally means a German monopoly of most of the electrical needs arising in connection with the development We should like to see more of such concessions. British money invested in Russian electrical concessions, and to have some assurances that the investment of such money will bring us actual business as well as dividends. But, whatever may happen in these directions, we think it is obvious to all who have studied the peculiarities of the position, that Russian electrical trade is not going to be won, and held, unless measures are adopted commensurate to the present and prospective value of the trade, and suited to the difficulties of the case. We believe it is generally recognised that in Canada, a British Dominion, the Americans have been able to secure a firm hold upon some departments of electrical trade by influencing in the past the character of Canadian electrical engineering work. Geographical situation and seizure of early opportunities have assisted to produce this state of things, and the result is that, to British firms, Canada has proved to be one of the least easy of all British Colonies to work.

Now, to an Englishman the Russian character and point of view are not likely to be easier to understand than the Canadian, for our small knowledge of the language at once forms a handicap.

It seems to us that we have got to recognise that when we are not at war, the position in Russia is somewhat similar to that in Canada so far as British electrical firms are concerned. There are on the side of Germany all the advantages that ensue from geographical situation, long years of close study of the market and of the Russian peop'e, financial control, and linguistic attainments. The Allied Russians will not want to buy from Germany, but our kith and kin in Canada have frequently said that they wanted to order from England—in actual fact, however, they more often go South over the border to get what they want if Canadian factories, often of American ownership and control, cannot meet them. What will happen to those German-owned factories in Russia is, as we say, an interesting question for the future, but we put forward this brief comparison between the land of an Ally and a British Colony more with the view to. assisting the trade to a proper understanding of the position so that measures conceived, and plans elaborated, shall be of a suitable character.

By the courtesy of a correspondent we are enabled to publish below some extracts from a letter received from an Englishman long resident in Russia and doing business there in electrical and engineering goods. We believe that they will repay study.

I may say plainly that quality and endurance are most important points for the market in electric lamps here, for we are flooded with lamps with very short lives, as I know to my cost. An "All-Russian lamp" factory is now just starting in Moscow. . . . It is said that the duty on foreign lamps is to be raised, and this

may help it in competing with foreign lamps. The present duty is 30 roubles per pood. A pood is 36 English lb., but what a rouble is at present (30/13t. December, 1914) it is difficult to say. Before the war it meant 9.5 roubles for £1, but just now, it is about 11.70 for £1. This makes a big difference. Another trouble is that no banks are issuing foreign cheques, so it is impossible to transmit any money at present, but the local papers say that negotiations are on foot between the British and Russian Governments to arrange some modus vivendi, so as not to put a stop to all business. In the district of Kieff there are about 300 sugar factories . . . . they require a good lot of lamps. Commission must be liberal in Russia owing to the enormous distances to be travelled, and the hotel expenses, &c., not to speak of the well-known Russian system of bribery. Every order has to be bought. [This impression is discredited by other authorities.—Eds. E.R.]. In Western Europe one can see from one town to another, but here at Kieff it takes 12 hours in a fast train to get to anywhere—400 miles. Three days ago the railway fares and freights were raised 25 per cent, and refreshment still more, as no drink of any kind is allowed, so that all the profit has to be put on the food. Samples to Russia should be rent per Foreign Parcels Post—not by "Express Agents"; they will be here in about three weeks from date of despatch.

Another Russian correspondent (writing from Finland)

Another Russian correspondent (writing from Finland) lays great stress upon the importance of cheapness if British firms desire to capture the German trade in electric lamps. Unlike the above writer, he says that while British-made lamps are recognised as being "far better, giving a brighter light" than German, the cheaper article is preferred—"inferior quality seems no objection." He suggests that British firms should "use cheaper material and be on the competition line," as unless they can produce cheaply they will never do a trade there.

The Promotion of Russian manufacturers to the necessity for rendering themselves independent of German products resulted in the holding at Petro-

grad, on February 12th, of a conference, which was attended by representatives from all large towns, of the electrical section of the Imperial Technical Association. chairman pointed out, one of the most important problems which had to be solved was to ascertain the factors which would enable the Russian technical industry to dispense with Germany; and this question was followed by a discussion as to the possibility of constructing various apparatus for telephony, telegraphy, and radiography, &c. In this connection it was mentioned that the electrical industry was almost entirely dominated by the Germans, who also controlled most of the patents used in electric lighting work. A great surprise was sprung upon the conference by the announcement that the mines in the district of the Urals, which furnish wolfram ores for the manufacture of incandescent lamps, are still in the possession of the Krupp company of Essen, and that the latter receives delivery of the metal itself at the price of 4 roubles per pood, as compared with the customary charge of 67 roubles per pood. The final result of the conference was the adoption of a resolution deciding to approach the Government with a request for support to the native electrical industry by all means available, in regard to Customs conditions, and freight rates.

AT the evening sitting of the Congress Russia and on the Russian Electrotechnical Industry Electric Lamp on February 13th, Mr. A. V. Olshvang Production. gave a report on the present position of electric lamp production in Russia. He said that at present the Russian factories in Moscow, Petrograd, and Warsaw, engaged in the production of electric incandescent lamps, put on the market an average of 20,000 carbon lamps per day, and about the same quantity of metallic-filament lamps, the aggregate being between 10,000,000 and 12,000,000 lamps a year. But, unfortunately, these so-called Russian lamps included nothing that was Russian except labour, for the Russian factories simply assembled the various parts that had been imported from Germany. The question was, could not Russia make her own lamps without appealing to the foreigner for the half products? He was of opinion that Russia certainly could do so, for she had the material, and all the details of lamp production were well known to

her. But until the war broke out no one thought of taking

up the production in Russia; in fact, there was no profit in it, for, thanks to the low Customs duty, the parts could be bought more cheaply abroad. No factory in Russia was equipped for making the bulbs, but recently the Russian glass factories had undertaken their production, and already lamps furnished with Russian-made bulbs had been put on the market. The tungsten filament, the most delicate and essential part of the lamp, had ceased to be a secret, and one of the laboratories in a Moscow factory was already producing it. Wolfram was found in Siberia, in the Urals, and in the Caucasus. The speaker referred to the Krupp influence, which was also mentioned at the meeting of the Imperial Technical Association, and said that at the beginning of the war, deposits of wolfram were being exploited by Krupp, who had leased them from a Urals industrialist through one of his agents. When the war broke out, Krupp's agent left Russia, and the owner of the deposits cancelled the contract with Krupp, and so, according to Mr. Olshvang, the exploitation of these deposits remained an open question. The lecturer added that this fact showed how important it was that deposits of minerals in Russia should be protected by the Government from foreign contractors.

One Russian factory had already begun the manufacture of filaments, and probably within four or five months lamps would be available that could properly be termed Russian

produced lamps.

The tariff must play a great part in the development of the national production of lamps. Whilst on carbon lamps the import duty was 30 roubles per pood, i.e., about 6 copecks (6 farthings) per lamp, or 20 to 30 per cent. of its cost, the duty on metallic lamps was not high enough, although it had been increased to 65 roubles per pood in respect to them. The position was that the first metallic lamps were somewhat large and not more than 500 went to the pood. But then Germany and other countries began to make miniature lamps, of which more than 1,500 went to the pood. So, whilst previously the duty on a lamp amounted to about 12 copecks (3d.) it became much less for the smaller lamps, making about 1d. each, i.e., about 5 per cent. of the cost. Such an insignificant duty might seriously prejudice the development of the Russian lamp industry. The lecturer's observations closed with an appeal urging the need for exploiting Russia's deposits of wolfram, molybdenum, and nickel.

THE market for rubber although show-Rubber. ing a quiet tendency, has, nevertheless, maintained a very firm front, and there appears no reason to anticipate any material alteration in the general outlines of the position for some little time to come. The export movement of raw material from the Middle East is considerable, the official particulars of shipments of plantation rubber from the Straits Settlements in January being 2,576 tons compared with 2,334 tons in the previous month, and 1,181 tons in the corresponding month of the previous year. Considerable importance attaches to the progress of affairs in the United States, and the fears which had been acute that a quarter of a million men or so might be thrown out of work owing to the British embargo upon shipments of plantation rubber grown in British Colonies in the East, was promptly dissipated earlier in the From then onwards there have been regular shipments of the material made to the United States, and the consuming industries in North America are now more actively engaged than ever before. It can be taken as a fact that the American rubber trade is fully satisfied with the terms of the guarantees imposed in connection with the exportation of rubber goods to the Germans, Austrians and Turks, and also with the arrangements under which it is only possible to export goods to neutral countries by way of Great Britain. At all events, the United States' trade is not unduly hampered by the restrictions imposed, all of which are very necessary for the safeguarding of the British and their Allies, and there is no intention of conceding any points to the enemy in the rubber trade.

It is understood that an amalgamation is to take place between the Linggi and Port Dickson-Lumut Companies. This will certainly be a very interesting event, and one which should be of advantage to both parties to it. In a recently issued report upon the International Rubber Exhibition of last year, the Ceylon Commissioner, Mr. Lyne, makes reference to the relative merits of plantation and fine hand Para rubber, and remarks that he was not able to get any admission from any manufacturer that plantation rubber was as good as fine hard Para where goods that would stand up against the severest tests were required. This is hardly fair, however, to the plantation product, for at least one of the largest rubber using concerns in the country is a strong believer in the cultivated article as against the wild material.

#### SEARCHLIGHT PROJECTORS.

BY C. W. DENNY, A.M.I.E.E.

So much has been achieved in the development of the searchlight, that the latest projectors bear but little similarity in features or in size to the very early types. The writer proposes to give a short historic sketch of their uses and growth, including the numerous improvements which have brought the projector up to its present position of efficiency and utility. Projectors have been largely used for naval and military purposes, for night observations, and signalling, the latter operations being mainly carried out on a semaphore or Morse code system. An early type of projector designed for night signalling by use of a semaphore

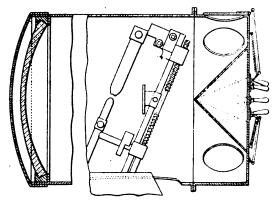

FIG. 1.—EARLY FORM OF PROJECTOR WITH FLASHING SHUTTERS.

system is illustrated in fig. 1, using a lamp with vertical carbons, as against the more modern lamps with horizontal carbons and flashing shutter. The construction of the lamp and body is characteristic of the early projectors; modifications are made with regard to the front, which allows of the direct is nance of the light-rays, the barrel is provided with an octagonal pyramidal reflector placed in the path of the light-rays, and having the apex of the pyramid facing the light. The sides of the pyramid are arranged to make an angle of 45° with the base. The effect of such an arrangement is that the light falling on the reflector is split up into eight beams, which are caused to travel in a direction at right angles with the original beam. The beam which travels vertically downwards not being required in practice, the corresponding reflector is omitted, so that seven beams are formed corresponding to the seven positions of the semaphore system. The beams of light are operated by doors or shutters on the external shell, which cover up the corresponding apertures, usually fitted with a concentrating lens to cause the rays to issue in a parallel The doors or shutters can be worked electrically from a distance, or by hand by a suitable arrangement of levers. Many arrangements of mirrors have been devised for operating a system of semaphore signals as described above. Provision has also been made for injecting into the beams of light jets of steam, smoke, water, or vapour, with a view to rendering the beams more clearly defined.

The optical part of a projector being obviously of great importance, considerable attention has been given to various forms of mirrors, the most efficient and recent being the parabolic mirror, constructed of crystal glass, or, more recently still, of metallic construction, other notable forms of mirrors being the Mangin, aplanatic, and spherical. It

is not strictly true, in the case of the latter, that all rays parallel to the axis meet at a point (the focus), and this irregularity (which is found in lenses also) is known as "spherical aberration." If the pencil of rays is small they may practically be supposed all to pass through the focus, but for wide pencils this is only so in the case of parabolic mirrors; hence their use for projectors. Parabolic reflectors were used as far back as 1763 for lighthouse illuminations by a Mr. Hutchinson, of Liverpool. These mirrors were formed of small facets of silvered glass made up as nearly as possible to a parabolic curve.

The most important improvement from an optical point of view has been the substitution of the gil led metallic mirror for the silvered glass mirror, either Mangin or parabolic. In the production of good metallic reflectors it has been necessary to overcome numerous difficulties, notably those incidental to the design and construction of special machines for working up the parabolic metal pieces, as machines formerly used for glass mirrors could no longer be employed. After working up, the mirror should be polished carefully, and covered with a fairly thick deposit of gold, all of which presents difficulties corresponding to the dimensions of the mirror. Experience has shown that gold-coloured metallic mirrors in clear weather give results comparable with glass mirrors, and as soon as the weather becomes foggy the gilded reflectors are superior to silvered glass. The advantage of metallic mirrors, from a military point of view, are incontestable. They present, besides a complete resistance to variations of weather and temperature, the advantage of withstanding shocks from gun fire, and they can be pierced by bullets without the intensity of the beam being sensibly A further advantage in favour of metallic diminished. mirrors is that of weight, they being considerably lighter than glass mirrors. The weight of a 26-in. metallic mirror is approximately 30 lb., whereas that of a glass mirror of the same size is about 165 lb. The employment of metallic mirrors also permits of much shorter focal lengths than are permissible with glass mirrors, owing to the intense heat generated, which would result in blistering the silver on the mirror, or even breaking the glass if in close proximity. Having found that, especially with horizontal carbons, the central zone of the mirror is practically useless, a central aperture is made in the mirror with a view to rendering more efficacious the ventilation of the silvered surface (in the case of glass mirrors); this also facilitates the manufacture, and enables the mirror to better resist air pressure due to the discharge of heavy guns. Mirrors, whether of metallic construction or of crystal glass, are usually fixed to the body of the projector in an easily detachable frame, to allow of rapid inspection and cleaning operations.

One of the earlier methods of focusing a projector lamp was to move the mirror in relation to the arc, the mirror being mounted in a movable frame or carrier arranged to move parallel with the axis of the pro-The later, and more approved method, is to move the lamp in relation to the mirror. This is usually accomplished by having the lamp mounted on guides or rnnners and attached to an adjusting screw or handle, by means of which the lamp can be moved in either direction This arrangement has the advantage of rapid manipulation, and it can also be used to produce a divergent beam. This is obtained by varying the relative distance between the arc and reflector, which can be done by a few turns of the handle supplied for that purpose, the movement changing the light from a straight beam to a widelydivergent beam, or vice versa. A much more effective method lies in the use of dispersion lenses, sometimes called "divergers," which consists of strips of plano-convex glass, set in a suitable frame for slipping over the front of light projector, or arranged to swing across the beam of light. The rays in passing through these strips are first converged, or brought together, and then, as the rays cross, they spread out again, and continue to spread indefinitely. The effect when placed in front of a searchlight is to spread the light out in the shape of a partly-opened fan. The light is spread out horizontally, but not vertically. The light when thus spread is not so penetrating as a parallel beam. Many forms of dispersion lenses are arranged in a separate ring or mounting, which, when required, has to be fixed over the main glass door. This has always been a troublesome

operation, and after being used a few times the usual practice has been to put the dispersion lens door carefully away and never use it again, notwithstanding the great convenience resulting from its use. A novel method of fixing dispersion lenses inside the barrel has been adopted on some projectors of American design. The lenses in question are arranged in two semi-circular brass rings so pivoted that they can be swung round a vertical axis. On the top of the barrel are provided two brass handles, by means of which the lenses may be swung into position or out, as desired. This takes but a few seconds, and the front door need not be opened. The dispersion lenses when out of use lie in a vertical plane parallel to the beam, and, being of very small section, do not interfere with the efficiency of the beam to any appreciable extent. The usual angles of divergence for, say, a 24-in. projector are 16°, 20° and 30°, other angles being easily obtainable for special requirements. Modifications in the dispersion lenses meet the requirements of the Suez Canal regulations, which stipulate that all ships traversing the Canal at night by means of searchlights shall project a beam of light forward which shall have a shadow in the centre of 5° divergence.

The bifurcated beam thus required has been produced in several ways, some designers preferring a system of metallic strips or shutters placed in front of the dispersion lenses,

while others prefer a series of prismatic lenses.

Flashing Gear.—This can generally be brought under one of two classes—internal or external. The internal flashing shutters were mostly used in conjunction with the vertical carbon lamp, and were usually in the form of a plate or disk of suitable shape arranged to intercept the rays of light between the arc and the mirror.

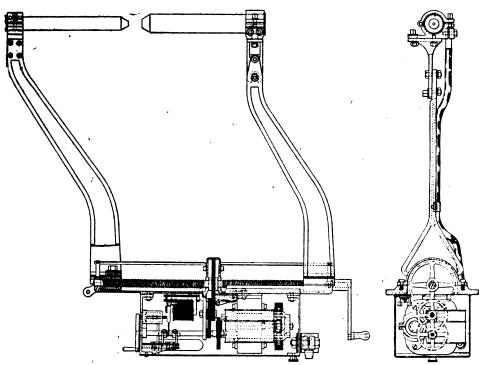

FIG. 2.-MOTOB-DRIVEN PROJECTOR LAMP.

Flashers of this type had numerous drawbacks, the most prominent being the formation of shadows in the beam when the flasher was out of use. These shadows were caused by the flasher plate or its fixings coming within the cone of rays thrown on the mirror by the arc, so that the efficiency of the beam was materially affected. Also the more general use of projector lamps with horizontal carbons makes it difficult to design any really good arrangement of internal flashing gear. The external flasher, consisting of a series of Venetian shutters in front of the door, entirely eliminates his trouble.

Projector Lamps.—The earlier types of projectors nearly all used a lamp in which the carbons were in an inclined position; the result was that the carbons, carbon-holders, and supports caused very bad shadows in the beams of light. The horizontal carbon lamp is now almost universally adopted for projectors. The use of this type of lamp materially adds to the efficiency of the projector, in that there are no

bad shadows produced on the mirror. The lamps are usually of the differential type, operated by a shunt and a series coil, much in the same way as an ordinary vertical arc lamp, the feed mechanism necessarily being modified to suit the requirements of a horizontal position. The carbons are fed by means of a screwed rod having a right and left-hand thread, and actuated by means of a shunt coil through suitable pawl mechanism. Motor-driven projector lamps have been in use, mostly on the Continent, for some 15 to 20 years. An illustration of a motor-driven projector lamp is shown in fig. 2.

(To be concluded.)

# AN ELECTRICALLY-CONTROLLED CANAL BRIDGE.

Acting conjointly, the Corporations of Glasgow and Clydebank have had constructed over the Forth and Clyde Canal, at Dalmuir, a swing bridge which is claimed to be the first bridge in the world where the whole of the functions of opening and closing the bridge and the road, and controlling and safeguarding the vehicular, pedestrian and waterborne traffic, are performed electrically by one man operating from one position. The bridge consists of a single swing span constructed of steel, with a roadway 20 ft. wide between the girders and two footpaths, each 5 ft. wide, carried on brackets projecting outside the main girders. A double line of tramway is laid on the roadway, and the

overhead tramway conductors are carried by light girders with supporting columns on either side of

the bridge.

It was at first thought to be impossible to operate the gates, locking bolts, bridge bolts, jacking gear, runaway points, and signals electrically, and a system of mechanical bell-cranks and levers was suggested, similarly to other swing bridges. Obviously a bridge so arranged would have required a larger staff to operate it than is necessitated by the electric control system that has been adopted.

A scheme for the complete electrical operation was put forward by the Igranic Electric Company, and the obvious practicability of this scheme so favourably impressed the consulting engineers (Messrs. Crouch, Hogg & Easton) and the authorities (The Caledonian Railway Co., and the Glasgow and Clydebank Corporations) that it was decided to ask several of the most prominent electrical

engineering firms to put forward electrical schemes.

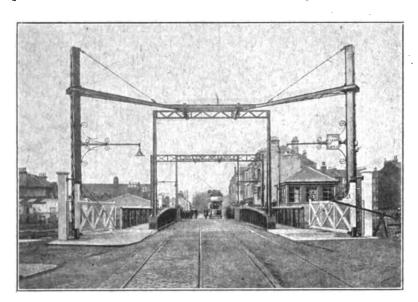

Ultimately that originally put forward by the Igranic Electric Co. was adopted, this firm having had considerable previous experience in the operation of swing and Scherzer rolling bridges. The main objects of the scheme were:—(1) The safety of the public; (2) To make the bridge so fool-proof that it could safely be operated by unskilled and consequently inexpensive labour, and to arrange the operation so that only one man would be needed to do everything necessary for opening or closing the bridge and gates, and that he could operate from one position.

It thus dispenses with the services of two other men, who, under a mechanical scheme, would have been necessary day and night to open and close the road gates, &c. For this purpose the whole of the operations are put under the control of a small master switch in the bridgeman's cabin. This master switch is of the most simple and mistake-proof character. It consists of a small metal box

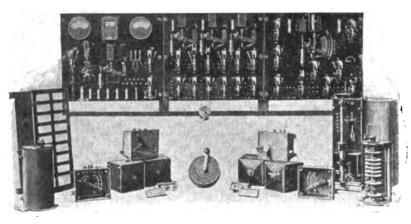

having a vertical handle which is moved in one direction to open the bridge, and in the opposite direction to close the bridge. On the box are marks on each side of the centre, showing the position to which the handle should be moved for each successive operation of opening or closing the bridge. This master switch is the only piece of apparatus that has to be manually operated, all the rest of the controlling gear being automatic.

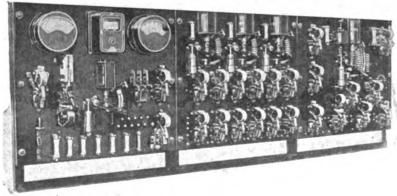

The sequence of operations is as follows:—Assuming the bridge to be closed to canal traffic. To open the bridge the operator moves the master switch handle to the first posi-

ELECTRICALLY-CONTROLLED CANAL BRIDGE AT DALMUIR.

GROUP OF BRIDGE CONTROL GEAR IN WORKS.

MAIN CONTROL PANEL.

tion in the direction marked "open." This first sets at "danger" a semaphore signal at each end of the bridge, and causes a loud ringing bell to sound in the road at each end of the bridge and up the side street. Until this bell has rung for a predetermined time (say 10 seconds), nothing further can be done, no matter how the operator moves the master handle. When this period has expired, it is pos-

sible, by a further movement of the master handle, to open the runaway points so that a runaway tramway car could not run on to the bridge or into the canal, but would be turned on to side lines.

A further movement of the master controller handle switches the electric current from the tramway overhead wires on to the switchboard in the machinery house, so that it is available for turning the bridge, and the overhead wires on the bridge are at the same time made dead.

On moving the handle to the next notch, the road gates on the east side of the bridge are started in the closing direction,

and this movement continues until the gates are within, say, 18 in. of being closed, when they automatically stop. The gates on the west side are then nearly closed in like manner, and after this it is possible to entirely close first the eastern pair of gates, and then the western. The object of this intermediate partial closing of the gates is to prevent the possibility of a child or a careless or intoxicated person being caught and squeezed between the gates. The gates, having been closed, are automatically locked in position.

A further movement of the master handle

A further movement of the master handle unlocks the bridge bolt, which is used to keep the rails on the bridge in correct alignment with those on the road, and when this bolt has been withdrawn, it it possible by a further movement of the master handle to start the jacking motor so that the jack is unscrewed. (This jack is used to take the weight of roadway traffic when the bridge is closed and prevent any movement of the bridge while traffic

MASTER CONTROL SWITCH.

is passing over it.) The bridge is now ready for swinging, and the master handle being moved to the next position the bridge motor starts and the bridge swings in the opening direction. When it is nearly open. it is automatically slowed up and finally stopped without any jar against the abutment, and this slowing and stopping are entirely automatic and demand no care from the bridgeman. The master handle can now be moved to the central position again ready for closing the bridge. To close the bridge the operator would move the master handle step by step in the opposite direction to that for opening. is impossible either when opening or closing the bridge to do anything out of the proper order, no matter how the master controller handle is operated, as the various functions are so interlocked that improper or impatient operation only stops the process of opening or closing and compels the operator to confine himself to the proper method. For example,

should the operator impatiently move his master handle forward to commence any movement of the machinery before the proper preceding movement has been entirely completed, he would only succeed in stopping all movement until he moved his handle back to the correct position and proceeded in the ord-ined manner. He is kept informed of the completion of each movement by a visible signal given

automatically on an illuminated indicator in his cabin. The operator can, in case of emergency, stop any operation at any point and can even, if necessary, reverse it. Furthermore, he can at any time sound the loud alarm bell by merely pressing a button.

Every operation is performed by electrical means and the design is such that any failure of the electrical supply or any breakdown of any part of the gear can at the utmost only stop the operation of the bridge, but cannot produce improper operation and thereby lead to an accident.

A bridge on similar lines is under construction at Kilbowie Road, Clydebank, in connection with the tramway extensions from Clydebank to Drinbocher.

## LEGAL.

RUTHENBERG v. BRITISH ABRASIVE WHEEL Co. (Concluded from page 315.)

THE plaintiff was called, and in the course of his evidence said that the insulation was not first class and suitable for the pres which it had to withstand. He was unable to account for the breakdown. He went to the works of the defendants in company with Mr. Swinburne, the well-known electrical engineer, to make tests. They were met by Mr. Strover, on behalf of the company, who told them that the asbestos cloth insulation for the water-jacket had not arrived. When the asbestos cloth did arrive Mr. Strover and his assistant proceeded to wind it round the electrodes, and bound it with what was known as broom-wire—an iron wire coated with tip. The work was not satisfactory. It was a concoated with tin. The work was not satisfactory. It was a continuous wire, and when it broke the whole uncoiled. It broke immediately they tried to put the electrodes into the jacket. They could only get two electrodes in, and Mr. Strover persisted in using a stump 18 in. long. When remonstrated with, he said he could not afford to throw the stump away. Witness saw the stump brought from the waste dump, where it had been thrown away. It was not possible to get a whole carbon in, and witness was so anytions to get the test over that he agreed to man with the states. anxious to get the test over that he agreed to run with the stump. Witness described in detail the manner in which the test was carried out, and said that the manner in which the test was made was responsible for the failure of the furnace to work properly. Mr Scrover, when the test had been made, said the pump was no good, the furnace was no good, and he (witness) was no good. He (witness) agreed that it was useless to carry on the test under the circumstances

On March 3rd further evidence was called in support of the plaintiff's care

MR. EBNEST ROBERT WATSON related the steps which had been taken by him to test the transformer. He said it was wound for a

high voltage. It broke down owing to a leakage from the bottom.

In cross-examination, he said that assuming proper precautions were taken there would be nothing improper in putting it to a test of 9.000 volte.

ME. JOHN PINNOCK, foreman at the machinery department of Tangye & Co., described the test to which he had put the "jack." He said that he had subjected it to the hydraulic test of 8½ cwt. to the eq. in., which was equal to a carrying power of 3½ tons.

WM. BISHTON, also employed by Tangye & Co., also gave evidence as to other tests.

as to other teste.

MR. CLAVELL SALTER, K.C., in the course of his opening for the defence, said that the contract having been made, the defendants took works on the Tyne where they were going to manufacture the abrasive wheels, and waited for the furnace to come, but it was not delivered until long after the contract time, and when delivered, he contended, it was a worthless thing. A plan was submitted to Mr. Strover, and after examining it, he said in fact, "go ahead," but that could not relieve the plaintiff of responsibility. The specification sent was, in fact, for wholly different furnace. Mr. Ruthenberg asked for £500 efore delivers was complete. The defendants asked for delivery before delivery was complete. The defendants seked for delivery of the remaining parts, but plaintiff disclaimed any guarantee, and said that the furnace as ordered had been delivered, the other parts referred to being outside the contract. The other parts arrived in due course, and the furnace having been erected the power people required to test the transformer, and they submitted it to a fair and proper test under which it broke down. That involved a delay of 10 days for repairs, and it had stood the test afterwards and had been at work since. When the furnace was delivered it was tested, and the result was complete failure, no commercial result being obtained. With the exception of the bood, the furnace was the ordinary electric furnace, and the hood seemed to be an encumbrance rather than an advantage. It was not suggested that the furnace, as worked by the defendants, was a hopeless failure, but as supplied by the plaintiff it was. Some evidence was called in support of counsel's statement.

On Monday, March 8th, further evidence was given for the

defence.

MR. E G. STROVER related the various experiments he had made at the works of the defendants in order to make the furnace effective.

In cross-examination, he said that on July 26th the furnace was erected, in accordance with the plans, with the exception of the

electrodes. On August 26th, he said, they had an explosion, after which he took off the water-jacket. He continued working with the outer shell until September 25th, and then he took the hood off. Subsequently he made various other changes. Witness admitted that the correspondence showed that the plaintiff objected to the removal of the shell or jacket, and that he (witness) had said that it had been removed for the time being because it was in the way. He removed it before it had been

Other witnesses were called, and the hearing was again adjourned. On Tuesday, after counsel's speeches, the Referee gave judgment for the defendants on the claim and counterclaim, with costs, and judgment was entered accordingly.

BRITISH INSULATED AND HRLSBY CABLES, LTD., v. CRITTALL MANUFACTURING Co., LTD.

In the Official Referee's Court, on March 1st, Mr. Muir Mackenzie commenced the hearing of an action for the recovery of £544, the price of an electric welding machine, &c. The defence set up a price of an electric welding machine, &c. The defence set up a counterclaim for breach of contract, the defendants alleging that in view of the contract being carried out they purchased a motor and generator and other electrical plant in connection with the welding machine, at a cost of \$283. The defendants also claimed for expenses incurred in setting up and testing the machine. They contended that the machine did not comply with the specifications and description contained in the contract, and that it was totally unfit for welding casement frames. The machine at the totally unfit for welding casement frames. The machine, at the request of Messrs. Bullock, acting on behalf of the plaintiffs, was returned for further tests and alteration.

MR. GREER, K.C., for the plaintiffs, said there was no dispute as to the order having been given or as to the delivery, and subject to the counterclaim the plaintiffs were entitled to judgment for the amount due. The defendants contended that as the welder had not complied with the contract they were not liable to pay for a copper and rubber cable. The plaintiffs were, said counsel, manufacturers of electric welding machinery, and they had had during the past 20 years considerable experience in that kind of work in this country. The defendants, who were makers of metal casc-ments for windows, got their material in bars, which had to be welded together in order to form the frames. Up to the time when they purchased the plaintiffs' machine, they had welded their bars by means of gas blowpipes, which was not nearly so efficient as the process of applying heat by means of electricity. What the defendants complained of was that the plaintiffs had what the detendants complained of was that the plaintims had undertaken within a given time to deliver a machine which would weld casement metals with a minimum of errors, and this, they said, the plaintiffs' machine did not do, and that further time was allowed the plaintiffs in which to complete the contract, which they failed to do. Counsel detailed the circumstances which led up to the contract and explained that the delays complained of were up to the contract and explained that the delays complained of were brought about by matters which were outside the contract. The defendants, for instance, he said, failed to send the materials which were necessary for making the test under the contract. Another cause of delay was that there was no permanent power plant upon the works. There had been a fire on the works, and the insurance company did not approve of the temporary plant introduced. He contended that the plaintiffs had produced a satisfactory machine, and he suggested that the Referee, with experts representing each side, should visit the works and see the machine at work. at work

The REFEREE expressed his willingness to see the machine,

The RPFEREE expressed his willingness to see the machine, after hearing the evidence, and before giving judgment.

MR. SIDNEY CHAS BULLOCK, manager of the electric fitting department of the plaintiffs' firm, gave evidence in support of the plaintiffs' case. He said that the plaintiffs experimented upon bars sent to them by the defendants in September, 1911, and explained how the welds were made, with results which proved satisfactory when they were submitted to the test of force. Where the welds did not prove satisfactory, it was owing to the parts being of different dimensions. He pointed out to Mr. Crittail that he could never expect to get satisfactory welds with bars which varied in thickness to such an extent as those that had been submitted for test.

In cross-examination as to the importance of the variation in the dimensions of the bars, the WITNESS said that where the ends of the bars did not come into close contact with the clamps, the parts did not heat equally, with the result that an imperfect weld was formed.

On the hearing being resumed on March 3rd, the REFEREE said he would like to see the machine at work, but it would not be convenient for him to visit the works until Tuesday this week, and in the meantime the evidence in support of the plaintiffs' case might be completed.

MR GREER, K.C., said it might not matter whether the machine was now in a complete condition, as, technically, the defendants might say they were entitled to refuse the machine because it was

not demonstrated at the time; but even that would not entitle them to throw upon the plaintiffs the cost of the experiments.

MR. PAUL BUCHER. manager of the plaintiffs' electric welding shop, a postion which he said he had held for eight years. in the course of his evidence described the manner in which the welding was carried out in the case of a printer's chase, the machines for which he had designed and carried out himself. In that case, he said, the material was cold-drawn steel, and at the welded corners the bars were quare cut. Before doing the defendants work he had had no experience in making metal casements. The metal sent to be welded in the first instance differed from that supplied after the machine was delivered to the defendants, and the clamps previously used would not do for the material supplied later.

Clamps were very important in a welding machine, and he could only make the clamps by having the materials to be worked upon, or dimensioned plans.

The hearing was again adjourned.
On March 4th, evidence was given by Ds. Brisler, the British Insulated Co.'s analyst, as to the result of his analyses of the metal submitted to the plaintiffs for the experimental working of the machine. He said that the result of his analyses was that an excess of sulphur existed in the metal, and that that excess was prejudicial to good welding. There were other chemical constituents in the metal in addition to iron, and he was not prepared to say that the fault was attributable to any one of them alone; but for

that the fault was attributable to any one of them alone; but for the purposes of electric welding an excess of sulphur in the metal was a fault which prevented good welding. There was an essential difference between electric welding and welding by gas. The Cable Co. were great experts in electric welding.

Mr. D. Sinclair, electrical engineer and general manager of the plaintiffs' works, said that he had occupied that position since July, 1902, and before that he was 20 years with the National Telephone Co. He had had a wide experience in all varieties of electrical machinery for many years and ence in all varieties of electrical machinery for many years as a buyer, and later as a seller. The turnover of the Cable Co. was in the vicinity of two millions per annum. He took no active part in the designing or preparation of the machine in question; but when the difficulty arose he received a personal letter, in consequence of which he had an interview with Mr. Crittall, sen., at which Mr. Bullock, Mr. Harris and Mr. Bucher were present. The result of the meeting was, more or less, a compromise. Mr. Crittall had refused to pay some money which he (witness) thought had nothing to do with that particular transaction. The money was overdue from another account, and Mr. Crittall ultimately agreed to pay it. Upon that the machine was discussed as well as the size of the iron used for making the frames. It was agreed that the machine should be returned to the works, and that the defendants should supply the company with samples of such iron as they could buy commercially, and the company, on their part, agreed to do all that money and skill could do to make the machine properly. He believed it was understood that a reasonable inspection of the machine would be made by the buyer in conjunction with the company's experts, and he believed that at that time both parties thought they could be satisfied.

that time both parties thought they could be satisfied.

MR. BUCHER was recalled for further cross-examination, and in answer to Mr. Colam, he said that the novelty of the process of answer to Mr. Colam, he said that the novelty of the process of electric welding was that by using a great amount of current in excess of the carrying capacity of the metal heat was generated and the metal melted. The process was a speciality, but there was no difference in principle between the company's process and the process which was in use by German and American firms.

On Friday, March 5th, Mr. Harry Hughes Harrison, A.M.I.E., was called. He said that he was engaged as engineer at the London office of the plaintiff company with whom he had

at the London office of the plaintiff company, with whom he had been for over nine years. He first came into communication with the Crittall Company in 1911, and previous to that date he had not made any mitre welders. He referred to a number of interviews which he had had with the defendants as to the possibility of making successful mitre welds, which ultimately resulted in the contract. After that date he had no further negotiations until June, 1913, and then it was with regard to a compromise. At that time it was pointed out to Crittalls that there were difficulties in regard to the heating, owing to the variations in the bars, and that it would be necessary to provide a modified design of clamp. Mr. Bullock had stated that he and Mr. Bucher had discussed such modification, and that they were confident it would be successful,

but that it would involve a decrease in the rate of output. The amount of decrease was not mentioned, so far as he remembered, but Mr. Crittall stated that they badly wanted the machine.

MB. COLAM. K.C., in stating the case for the defence, said that while experimenting with the machine they were honestly trying to get it to work. He pointed to certain alleged defects, and said that if the defendants were carried and were trying to get it. to get it to work. He pointed to certain alleged derects, and said that if the defendants were captious, and were trying to get rid of the contract they would have at once told the plaintiffs to take the machine away, instead of trying in every way to remedy the defects, and this contention he supported by letters which had passed between the parties.

The hearing was again adjourned.

TUNGSTEN DRAWN WIRE .- PETITION FOR LICENCE.

(Continued from page 315.)

Evidence was given on behalf of the petitioners.

MR. CEGIL DOUGLAS FALCKE, secretary of the Robin Electric Lamp Co., stated that the Association's list price for lamps with a voltage of 200 to 250 was 2s. 8d., and for lamps of a low voltage 2s. 2d. The Association firms issued rules for the re-sale of tungsten lamps

MR CAVE called upon the other side to produce a copy of these rules.

WALTER said he did not care for the Tungsten Lamp sociation. He did not produce the rules.

MR. CAVE said witness had obtained what purported to be a copy. This was handed to the Judge, together with the price lists of the "Mazia," "Wotan," "Osram" and "Ediswan" lamps, which showed that the prices were all the same.

ME FALCKE said his company gave an experimental order for lamps in squirted wire, and these were made at 1s. 4d. each for low-voltage lamps, and 1s. 6d. each for high-voltage lamps. Messrs. Siemens made lamps for them with a voltage of 105 at the price of, he thought, about 1s. 8d.

Cross-examined by MR. WALTER: His company wanted to work Cross-examined by MR. WALTER: His company wanted to work under the Siemens and B.T.H. Co.'s patents, but they had no process at present and were not making any lamps. His company had obtained au estimate for the establishment of a complete factory for making lamps and wire. This was about £25,000. The cash capital of his company was £10,350. The company was promoted by the R. F. Syndicate, which was then taken over by the company with its British and foreign patents for 50,000 £1 shares. Two-filament lamps might be old, but the idea of their cap was new. His company's patent cap could be fitted to the lamps made by others.

MR. WALTER: Your ingenious idea is for a clip round a lamp.

ME. WALTEE: Your ingenious idea is for a clip round a lamp, to take 1s. 2j. as the cost and sell for 2s. 10d. less the discount to the trade, and net a profit per lamp of something like 1s. You now desire to come in after all the pioneer work has been done with a licence to start where others have ended?—That is not our

WITNESS said his company intended to make lamps in all the standard voltages and candle-powers. Cross-examined by MR. COLEFAX, Witness said they rejected an

offer by the Siemens Co. as wholly unreasonable, namely, is higher than the list price.

MB. SPENCER FLOWER, a director of the petitioning company, said they would prefer to buy their drawn tungsten wire from one of the patentees, but if they got a licence they were prepared to make their own. They would have no difficulty in getting compstent employés and in getting capital if the present obstacles were overcome.

Cross-examined by MR. WALTER, Witness said the original purpose of the company was to buy wire and get lamps made for them, but whether they afterwards made lamps themselves was a

them, but whether they afterwards made lamps themselves was a question of policy. It was never their intention to import lamps. Their intention was to fix the price at the same figure as lamps were being sold at. They might charge a few pence extra.

MR. GEORGE HOOKHAM, of Birmingham, stated that he was interested in the Robin Co., but was not a director. He had no doubt as to the practical utility of the Robin lamp, or as to the reception it would meet with at the hands of the public if it were put on the market at a reasonable price.

put on the market at a reasonable price.

ME. JOSEPH T. ROBIN, the inventor of the Robin lamp, said that ME. JOSEPH T. ROBIN, the inventor of the Robin lamp, said that in an interview with the representative of the Siemens Co., the latter said they were very auxious to get the order for making the lamps, but they had to make conditions as to the price. The Tungsten Lamp Association wanted them to impose a price of 2s. higher than the list price, instead of 1s., but as the result of negotiations, the Association agreed to reduce the charge to 1s. more than the list price. The price was fixed on the amount of the discount, but he knew that bigger discounts were being quoted to other people. The Rubin Co had several contemporary waiting for to other people. The Robin Co. had several customers waiting for their lamps

Cross-examined by MR. WALTER: His company had considered the question of importing double-filament lamps, also wire. As to what would be a fair profit, it would not be fair to sell for more than the Tungsten Lemp Association obtained, because they thought that the Association were making too much money out of their lamps.

Re-examined by MR. CAVE, who asked if he had any idea of the profits made by the members of the Association, Witness said he had the word of one of the principal directors in Berlin of the com-

pany which made the Osram lamps that the profits were very high.

MR. S. BIHELLER, of the firm of Weiss & Biheller, Chiswell Street,
E.C., said he could get Austrian and German lamps for re-sale abroad at 6d. each. This would be the same type of lamp as was here charged 2s. 2d. for. He could compete with the Association in China and Australia by buying lamps at 7½d. each. The standard retail price for similar lamps in Germany was 1 mark 50 pfennigs.

Cross-examined by MR. WALTER: He did not sell in this country the lamps he bought at 6d. each because of the existence of the patents. In Canada they were sold to dealers at 18 cents each,

and to the public at 40 cents each.

MESSES. THOMAS ROSE and L. J. SIMON, electrical engineers,

MESSES. THOMAS ROSE and L. J. SIMON, electrical engineers, gave evidence as to the advantages of the Robin lamp. Mr. Rose said the price for drawn tungsten wire sold by the General Electric Co. in the United States was \$5 per 1,000 ft.

MR. MATTHEW ADAMS, an electrical expert who advised the petitioners on the wire patents which he had selected for inclusion in their petition, then gave evidence. Drawn wire, said Mr. Adams, reduced the cost of making up the lamps by not requiring so many joints in the filament. what about the brittleness in the hands of the consumer?

less in the drawn wire than in the pressed wire. In time there is a

tendency to crystallisation which tends to reduce the difference between drawn wire and pressed wire.

Have you found any country in the course of your inquiries outside the United Kingdom where the lamps have achieved so large a rise in price as in the United Kingdom?—No.

In your opinion is the price in the United Kingdom due to the merit of the lamp or other causes?—I think it is largely due to

merit of the lamp or other causes ——I think it is largely due to the great advertising of the people who had it in hand.

On the subject of competition, Witness said the putting of two groups into one combination restrained competition. In the competitive market royalties varied from 1 to 5 per cent, on the net selling price. He had known the royalty go as high as 10 per cent, but in a highly competitive field 10 per cent, would strangle a market

Would the Robin lamp with tantalum have a reasonable prospect -No, because tantalum has gone so much out of use that the public demand is relatively small.

Is the tungsten drawn wire important for commercial success?

Mr. Adams, in reply to further questions, said he gave an order in Italy for drawn-wire lamps, and was supplied with six " Z" lamps and six Phillips. The lamps were shown to his Lordship, who observed that the "Z" was priced at an English equivalent of 8d., and the Phillips at about 8id. Witness said these were the retail prices in the Italian market. As to the uses of tungsten which witness was asked about, he said he could not see why tungsten should not be used more than steel for some purposes, because it gave greater strength than steel and was non-corrodible. Tungsten gave greater strength than steel and was non-corrodible. Tungsten wires might, for example, be used for piano strings, and if there was an industry in the wire there would be many industrial applications of it.

This closed the petitioners' case, and Ms. CAVE summed it up. Whatever test, said Mr. Cave, was applied to the price of 125s. asked for the wire, that price was unreasonable, and it was wholly impossible to justify it. The petitioners were willing to take their relief on any reasonable terms, but his Lordship could not, under the Act, fix the price of the wire. They were willing to take a licence to make the wire only for the purpose of selling their licence to make the wire only for the purpose of selling their lamps, upon the terms of paying a percentage on the sale price. Why should the Robin Co. not get a licence on the terms granted to the Ediswan Co.? They were also willing to import the wire and to pay a royalty upon every metre imported. The Court had never looked with favourable eyes upon combinations of the kind engaged in the tungsten wire business. They were not illegal, of course, but they were prejudicial to the interests of the public. He submitted that the petitioners had made out a case for a compulsory licence.

His LORDSHIP intimated to Mr. Walter that he desired to hear

him on the evidence that had been given.

ME. WALTER said certain sections of the Patents Act were imposed on patentees who were unreasonable, but the case contemplated by the sections had not been attempted to be made out by the present petitioners. They had put their case not on the ground that the public were in any way hurt, but that they, the petitioners, were refused a licence, and that the true construction of the sections was that anyone might have a licence under any letters patent, and that the desire of an individual to work under letters patent, and that the desire of an individual to work under the patent was sufficient to justify the Court granting a licence. The petitioners' case must be put as high as that. They said they would like to have a licence under a group of patents which covered a large number of alternative methods of working, and then they would elect what they would do. There was no evidence of any existing trade or industry being unfairly prejudiced, or of any new trade or industry being unfairly prejudiced. Neither was there any evidence of any demand for the tungsted. Neither was there any evidence of any demand for the tungsted where others had sown by adding a small improvement to an existing invention and obtaining the benefit for themselver. They did not say under which patent they wanted to work, but they came to the Court for a general licence.

ME. COLEFAX said his clients, Siemens Broe., were the owners of three patents, and the patented article in respect of each was

three patents, and the patented article in respect of each was different, because the process was different. No default on the part of his clients had been proved as regarded the manufacture of the patented article. Meesrs, Siemens offered the petitioners to make their lamps on terms that were not unreasonable. The petitioners gave it out that their lamp would be a double-life lamp, petitioners gave it out that their lamp would be a double-life lamp, and that was the basis on which they were going to conduct their business. It would be a great injustice to the Siemens Co. if the petitioners were to be put in a position of being able to come into the market, and with a lamp that was going to last twice as long as a single-life lamp and sell at the same price. The Siemens Co. therefore said to the petitioners: "We will supply you with the lamp, and all we ask of you is that you shall sell it at not less than 1s. above the single-filament lamp." That was not an unreasonable request.

unreasonable request.

His LORDSHIP, in reserving his judgment, said that if he desired to hear the respondents' evidence, he would give counsel notice and

#### R. L. Jones & Co., v. ORPHEUM, LTD.

MR. VEBEY, one of the High Court's Official Referees, on Friday March 5th, commenced the hearing of an action in which plaintiffs, a firm of electrical engineers carrying on business at Teddington, sought to recover from defendants, a Cinema Theatre Cc., running picture palaces in various parts of the country, the balance of an account for electrical fittings, &c., for a theatre at Croydon.

The claim, said MB. WOODCOCK. who appeared for the plaintiffs, was divided into two parts, the first two items of £50 each coming under a general contract for fitting up the theatre, a concoming under a general contract for fitting up the theatre, a contract which provided for payments upon architect's certificates, and as to those he (counsel) contended that it was not competent for the defendants to go outside their contract. The other item of £46 11s, was for an electric motor and gear for raising the curtain, which was outside the contract work, which was to be done for £298. Specifications and an estimate were submitted by the plaintiffs, and approved by Mr. Gilbert Booth, the defendants' architect, who wrote an acceptance, the plaintiffs' undertaking being to do all the work of electric lighting and installing plant at the theatre. The work proceeded, and payments were made from time to time on certificates; but, notwith-standing the certificates, the defendants now sought to go behind them, and defended the claim on the ground that the work was not carried out according to contract, and that it was negligently and improperly performed. On particulars being applied for, they said that the motor-generators were not fixed so as to avoid vibration, the result of which was damage to the building, and noise causing annoyance to the audience. The generators, said counsel,

were fixed under the supervision of the defendants' own architect were fixed under the supervision of the defendants own architect, who chose the places where they were to be fixed, and he would not allow the generators to be bolted into proper cement-beds. If there were vibration, counsel contended, it could easily have been remedied, and throughout the whole of the correspondence he could find no complaint in regard to them. It was not until particulars were filed in the action that any complaints were made about without the complaints were made to the country of the complaints. particulars were filed in the action that any complaints were made about vibration. Defendants further complained that motor-generators sparked badly, but plaintiffs said that if there were sparking, it resulted from proper attention not being given to the machines. When fitted they were not sparking unduly, and were showing no signs of defect. The plaintiffs supplied Newton generators, which were the best on the market. The architect was satisfied, and there was no suggestion by him that they were not what they should be. were the best on the market. The architect was satisfied, and there was no suggestion by him that they were not what they should be. Then the defendants said that the lighting was defective, but that was denied by the plaintiffs, who stated that any small defects were remedied at once. All the small matters complained of had been remedied, and no complaint had been made afterwards until affidavits were filed under Order 14. The work was wards until amounts were fied under Order 11. The work was duly passed by the local authorities, by the lighting authority, by the police, and by their own architect. There was, moreover, no condition in the contract as to the silent working of the motor. It was quite impossible, where a curtain motor was placed inside the theatre, to avoid some noise, and consequently the common thing was to have the motor placed outside. In this case the architect had to say where it should be placed, and he chose a place under the stage, although it was pointed out to him that there might be noise owing to the stage acting as a sounding

Some evidence was given in confirmation of the statements of counsel, and the hearing was adjourned until Monday, March 15th.

#### SINCLAIR v. LEVINSKY.

In the Shoreditch County Court on Friday, before his Honour Judge Cluer, Charles Sinclair, trading as the MacFarland Electrical Co., of 83, Camberwell Road, S.E., sued Abraham Lavinsky, of Canonbury, to recover £63 10s. for electrical goods sold and delivered for the Daleton Playhouse Cinema, Kingsland. The case had been remitted from the High Court.

Mr. A. E. Robinson appeared for the plaintiff, and the defendant

in person.

It appeared that arrangements were made to build the cinema, and Mesers. Gasson, Cockerill & Cc., Ltd., got the building contract. Payment had mostly been made by bills, accepted by a Mr. Davis, who made the contract, and had formed the subject of High Court actions. It was alleged that although Davis was the signatory to the contract, the real one concerned was the defendant, whom, it was quite understood, was financing Mr. Davis. The wholin, it was quite understood, was limined mit. Davis.

electrical goods concerned in the action, it was suggested, were extra to the building contract, and the defendant himself chose them and ordered them, together with Mr. Davis.

The PLAINTIFF gave evidence as to this, and said the only one he recognised in the matter was the defendant, who was introduced

to him by the architect. It was true Mr. Davis was present when the goods were selected, but he appeared to be in the position of adviser, as the defendant did not appear to understand things thoroughly, but nothing was ordered except with the sanction of

the defendant.

MR. ERNEST CANNELL, the architect, said the defendant said he would see that the plaintiff was paid every penny. The builders refused to order the electrical fittings, as they said they were extra to the contract. Had the work gone through the builders it

would have cost 10 per cent. more—their profit.

After a good deal of detailed evidence had been given, judgment was entered for the plaintiff, with costs.

#### A QUESTION OF DISCOUNT.

In the City of London Court, on March 5th, before his Honour Judge Rentoul, K.C., Mr. George Braulik, electrician, 8. Lambeth Hill, E.C., brought an action against Mr. E. C. Goodfellow, electrician, 28, High Street, Highgate, to recover £1 17s. 5d., being the balance of a substantial account for electrical accessories supplied. The defendant said that when the plaintiff executed his various orders it was agreed that he was to have 5 per cent. off various orders it was agreed that he was to have 5 per cent. off the catalogue list in addition to 50 per cent. if he bought goods to the value of £25 or more. He put it on the order so there should be no misunderstanding. The plaintiff's representative said that they had given the defendant 50 per cent. discount, and their point was their traveller had agreed to give another 5 per cent. if the money was paid within a reasonable time, and that in their view the defendant had not made his payments within a reasonable time. Judge Rentoul, K.C., said in the absence of the traveller he must accept the defendant's description of the transaction. The plaintiff, like all other suppliers of electrical access traveller he must accept the defendant's description of the transaction. The plaintiff, like all other suppliers of electrical accessories, issued a catalogue charging 100 per cent. more than he was willing to take for the goods. That was done for the benefit of the innocent, but with traders like the defendant they knew they could get 50 per cent. cff. It was a business matter. It was very similar in the piano trade, where people could tell their friends that they had bought an instrument listed at 100 guineas when they had in fact paid £45 for it. He went through the accounts, and in the end gave judgment for the plaintiff for 9s. 7d. and costs. The defendant subsequently returned and asked for his costs, but was informed he would have to pay the plaintiff's costs instead of receiving any for himself.

#### POWER HOUSE ACCIDENT.—RAILWAY CO. FINED.

AT Formby, on March 3rd, the Lancs. and Yorkshire Bailway Co. were summoned for a breach of the Factory and Workshops Act in connection with an accident which occurred at the Formby power house. Mr. Samuel Pope (instructed by the Mr. L. S. Holmes), appeared for the Director of Public Prosecutions, and Mr. Hyslop Maxwell (instructed by Mr. Parmiter), represented the company.

The accident, it was stated, occurred as the result of two men continuing to work at a live switchboard. According to regulacontinuing to work at a live switchboard. According to regulations, they should have left the work until midnight, when the switchboard would be dead. They did the work on their own responsibility. When Hindley, one of the men, was on a step ladder, a cable he was carrying caught a live part of the plant. He was thrown from the ladder and severely burned. He was receiving hospital treatment, and the company were paying him compensation.

MR. MAXWELL pointed out that the company could have taken proceedings against Hindley for his action in working contrary to regulations, but they had preferred to take the responsibility for what he had done.

The MAGISTRATE imposed a penalty of £20 and £20 costs.

#### DAMAGES AGAINST WEST HAM COBPORATION.

DAMAGES to the amount of £300 were awarded in the King's Bench Division, on Friday, before Mr. Justice Shearman and a common jury to Herbert Spicer, a baker's assistant of Leyton, against the West Ham Corporation. Last May he was driving his van along the Broadway, Stratford, when a wheel was wrenched off, it was alleged, owing to the defective condition of the tramway route. Plaintiff was thrown to the road and broke his arm, and it was said that the movement of the arm was permanently impaired. The Corporation denied the allegations on which the claimed was based. claimed was based.

#### HOLBBOOK v. FORD.

Holbrook v. Ford.

In the City of London Court, on February 25th, before Mr. Registrar Wild, Meers. J. Holbrook & Co., electricians, Foeter Lane, E.C., sued Mr. Ford, shirtmaker, for 13s. 6d. for fitting up electric light at premises situate in Cheapside.

The plaintiffs' witness said that Mr. Ford made an application to them to fit the premises up with electric light. The work was carried out and no complaint was made. There were several applications for payment, and then Mr. Ford said he would let them have something on account. Later it was suggested to them that it was Mrs. Ford for whom the work had been done, and she had since been added to the proceedings. In January Mr. Ford came to them and told them he had nothing whatever to do with the business. That was the only evidence they had on that matter. The defendant, Mr. Ford, said he was instructed by Mrs. Ford to have the electric light put up. He (defendant) was only working as a porter for Mrs. Ford, and was getting no salary. Mrs. Ford had asked him as as favour to get the light put in. The Registrar said that the defendant went to the plaintiffs and did not say a word about Mrs. Ford being liable, but had himself given the plaintiffs the order for the work. What Mrs. Ford had said to him (defendant) was not conveyed to the plaintiffs. The defendant said what he had done was done on behalf of Mrs. Ford.

The Begistrars said the defendant should have given the plaintiffs the opportunity of trusting Mrs. Ford.

done was done on behalf of Mrs. Ford.

The BEGISTRAR said the defendant should have given the plaintiff; the opportunity of trusting Mrs. Ford. The defendant had made himself responsible for the work. There was no evidence in the case except what the defendant said about Mrs. Ford, and she would be struck out of the proceedings.

The DEFENDANT said he had nothing to do with the matter.

The REGISTRAR: You have everything to do with it. You have given the order for the work. You say you act as agent for Mrs. Ford, but inasmuch as you never mentioned it to the plaintiffs, you have made yourself responsible. It is no use your now saying the have made yourself responsible. It is no use your now saying the debt belongs to someone else.

Judgment was given for the plaintiffs, and an order made for payment in 14 days.

## THE VALUE OF A DOG.

AT the Manchester Assizes on February 26th, James Billington, travelling dealer, of Hilds Street, Moston, brought an action for damages against the Manchester Corporation, alleging that he received injuries while travelling on a city tramcar, through the driver pulling up the car suddenly. The driver of the car stated that he pulled up suddenly to avoid running over a dog. Damages of £100 were awarded to the plaintiff, and the jury expressed the hope that the driver would not suffer in any way. Mr. Justice Sankey expressed a similar hope, and couped undestook to convey Sankey expressed a similar hope, and counsel undertook to convey these expressions to his clients—the Corporation.

Ban on Electricity in Russian Churches.—The Bparchial Congress of Divines, having considered the principle and the practical aspect of allowing electric lighting in the churches in no case to be allowed in chandeliers, or before the sacred ikons (images), has proposed to lay a tax on the churches that use electricity, in favour of the Eparchial chandle factory. The tax is to be 40 copecks (about 10.1.) per lamp per year. The only lamps to be exempt from this tax are those illuminating vestibules. Cold churches, where services are only held in the summer time, will pay only half the tax.

#### WAR ITEMS.

American Electrical Exports.—The American "Electrical Review and Western Electrician" publishes the following particulars of the U.S. electrical exports for last December,

particulars of the U.S. electrical exports for last December, and also for the calendar year 1914:—

The December total was slightly below that of the preceding month, and still much below that of the corresponding month in 1913. For the four classes for which the number of articles shipped is given in the Government reports, there were exported in December the following: Electric fans, 693; arc lamps, 52; carbon-filament lamps, 34,856; metal-filament lamps, 383,545.

14,000, inclui-mament lamps,	000,	710.	
Articles.		Dec. 1914	l. Dec. 1913.
Batteries		\$ 58,947	\$ 45,928
Dynamos or generators		262,325	181,407
Fans	·	13,784	19,012
Insulated wire and cables		92,146	190,090
Interior wiring supplies,	etc.	•	•
(including fixtures)		54,8 <b>36</b>	52,125
Lamps—			
Arc		742	2,776
Carbon-filament		3,962	14,785
Metal-filament		64,058	21,267
Meters and other measu	rring		
instruments	•••	21,200	
Motors	•••	271,192	376,122
Static transformers	•••	62,097	134,213
Telegraph instruments (inc	clud-		
wireless apparatus)	•••	2,118	31,999
Telephones	• • •	113,627	<b>159,030</b>
All other	•••	599,529	1,005,245
Total	<b></b>	\$1,620,563	\$2,233,999

The table of monthly totals for the year 1914 shows that early in the year already there was a decline month by month from the high totals of 1913, which became most marked, however, in August, the first month of the war:—

						Electrical
Months, 1	1914.					Exports.
January	•••	•••			•••	\$1,947,646
February	•••	•••			•••	1,930,513
March	•••	•••	•••	•••	•••	2,104,332

American Electrical Industry: Its Opportunity.-" In American Electrical Industry: Its Opportunity.—"In every industry the business leaders are realising that an emergency exists. Methods and policies are changing. The overworked word "efficiency" which rolled so smoothly from the tongues of many for several years, has come to have a new meaning. We all know that intensified production and efficiency in the shop and in the office have been, to a great degree, matters of a conversational character. To-day men are more than ever earnestly seeking better ways of doing business, and it is a part of every business man's creed that it is along the lines of intensified producways of doing business, and it is a part of every business man's creed that it is along the lines of intensified production and increased efficiency of operative movements that increased profits lie. Business men are planning ways and means to-day that either because of conservatism or fear would have received but scant consideration only a short time ago. The dearth of raw materials forced upon us by the European war, which has deprived us of easy and economical access to many things regarded as indispensable in the fabrication of many materials has quickened the economical access to many things regarded as indispensable in the fabrication of many materials, has quickened the impulse of the American inventor and manufacturer, and new industries are springing up where it has heretofore been considered impossible to make a safe investment, to say nothing of gaining a decent livelihood. The necessity for quickly establishing new industrial relations and a better for quickly establishing new industrial relations and a better understanding of manufacturers in general of the economy and refinement of control of electrical energy, are attracting the brightest minds of aggressive manufacturers in every line of commercial activity to the use of electrical apparatus. . . . The present crisis is the opportunity of the electrical industry. As our factories become busier and busier there will be a greater demand for motor-driven apparatus, for other electrical appliances, and as the busy

plants work up to their normal capacity the greater will become the demand for controlled power. As the necessity for night work comes on the desirability of the use of elec-tricity as a medium of illumination will become more and more apparent. Any material prosperity which may come to other industries means a tenfold increase in the prosperity of those having to do with the generation of electrical energy and the manufacture and distribution of industrial electrical appliances."—" Electrical Review and Western Electrician."

Electrical appliances."—" Electrical Keview and Western Electrician."

An Appeal for Belgian Refugees.—Seventy little Belgian orphan children whose home (the Cathedral Orphanage) in Malines was burnt to the ground by the Huns, arrived in England, via Holland, in charge of their matron and Canon de Weerdt, in a pitiable plight. A place of refuge was found for them at "Highfield," Hendon, near London. "Highfield" was formerly a high school for girls, but it is now the property of the International Correspondence Schools, who purchased it the month before the war as a site for new headquarters for the Schools. The military authorities accepted the I.C.S. offer of the premises for accommodating wounded soldiers, but the claim of the seventy little ones was more immediately pressing and the buildings were placed at the disposal of the Reverend Mother of La Sagesse Convent, which is near by, as a Home for Refugees, for twelve months at a rental of one shilling per annum, the upkeep of the grounds and the other incidental expenses of the estate being undertaken by the directors of the I.C.S. The story of how the necessary furniture was got together, how the continuous flight from Belgium brought heavy demands, increasing the number in the home to 175, including 90 orphans, how all of these have been and are being fed and clothed, and the children taught and trained, how supplies have run perilously short, and how urgent is the need for assistance in order that the merest necessaries may fed and clothed, and the children taught and trained, how supplies have run perilously short, and how urgent is the need for assistance in order that the merest necessaries may be provided—all these things and more are told in a pamphlet issued by the I.C.S. The claims of Belgium are common to all Englishmen, and we pass on the appeal of the Reverend Mother and the Sisters of the Convent, heartily commending it to the generosity of our readers. One way in which support may be given is by purchasing tickets for a special matinee of "A Country Girl" that Mr. George Edwardes has kindly consented to give at Daly's Theatre on Wednesday, March 24th, for the benefit of the Home. These may be obtained from Mr. Edgcumbe Brighten, at the I.C.S. Offices in Kingsway. Offices in Kingsway.

The Swiss Aluminium Co.—The Chairman of the Neuhausen Aluminium Industry Co. has now made a definite statement setting forth the purely Swiss character of this undertaking, whilst the shareholders have unanimously sanctioned an alteration in the company's statutes expressing the Swiss nature of the enterprise in a more definite form. Why such steps should be deemed necessary is explained by the fact that the French Government has placed plained by the fact that the French Government has placed under compulsory administration—sequestration according to the Chairman—the company's subsidiary in Marseilles, which bears the title of the Société Française pour l'Industrie de l'Aluminium. The Chairman, in the course of the declaration made at the recent annual meeting, emphasised that the undertaking is a purely Swiss company which was formed 26 years ago, and still remains under the same chairmanship and the same management, and by far the greatest number of the shares have been in Swiss ownership for many years past. The company has lodged a protest against the action taken by the French Government, and hopes, with the support of the Swiss Federal Council, to secure the removal of the sequestration of the French branch company. Colonel Huber, the chairman, is reported to have further stated that the rumours circulated that the company was a stated that the rumours circulated that the company was a German undertaking emanated from former French partners and collaborators who wished to injure the enterprise on the pretext of patriotism. However that may be, we note from the reports published in the German newspapers of the company's meeting that an addition of three Swiss had been made to the board of directors, which now consists of nine Swiss and six—not Germans but "foreigners." If then, no addition had been made to the board, the number of "foreigners" would have still been equal to the Swiss. It seems unfortunate that the number of native Swiss has not been in a majority for years past.

Japan and Australia.—"The Sydney Morning Hereld."

Japan and Australia.—"The Sydney Morning Herald" states that Japanese Trade Commissioners were in Australia in January with the object of forming a stronger bond of commerce between the two nations. The head of the delegation, Dr. J. Miura, who is secretary to the Department of Commerce of the Japanese Government, interviewed some of the directors and heads of departments of business firms. Dr. Miura intends to stay in Sydney for two months, after which he will visit Melbourne, Adelaide, Tasmania, and New Zealand. His object is to interview the officials of the various State and Commonwealth Governments. The other members of the delegation, Messrs. F. S. Nakagawa, N. Matumora, and K. Hishida, are all business men in a large way in their own country, and they are at present getting into touch with the heads of the big business houses in Sydney. Mr. Matumora stated that he intended to investigate conditions and find out what was wanted. His firm were large general importers and exporters. They would take in Japan almost Japan and Australia.—" The Sydney Morning Herald"

anything that Australia could offer. Till recently they had been importing large quantities of machinery from England, but this was now obtainable only in limited quantities. The but this was now obtainable only in limited quantities. The market in Japan was dull, and they were looking farther afield for trade. He saw great possibilities for a market in Australia for glassware, which they could produce in unlimited quantities in Japan.

Board of Trade Assistance.—In connection with the special arrangements which have been made in the Commercial Intelligence Branch of the Board of Trade for dealing with appurities a lite of goods which forms in this countries.

ing with enquiries, a list of goods which firms in this country have intimated that they are prepared to suppy is now ready, and may be obtained on application to the Director of the Branch at 73, Basinghall Street, London, E.C. The Branch has also issued List No. 9 of articles which enquirers desire to purchase.

electric Lighting Engineers.—A Cardiff paper says that on March 3rd the Second Reserve Electric Lighting Companies of the Glamorgan Fortress Engineers left Cardiff for Milford Haven. They numbered 61 and were under the command of Captain Courtis, the other officers being Lieut. E. P. Rees and Lieut. Price.

Bradford Electricity Employés' Wages.—The Electricity Committee of the Bradford Corporation recently passed a resolution advancing the wages of engineers in the employ of the department by 3s. per week and reducing their hours to eight per day.

to eight per day.

Roll of Honour.-Private John Horrocks, who has died at Blackpool, where he was in training, was formerly employed by the Lancashire Dynamo and Motor Co., Trafford Park, and representatives of the firm attended the funeral

last week.
Private Walter Haynes (19) formerly in the employ of the Salford Tramways Department, has been killed in

action. On January 23rd, Private H. Dixon, of the 1st West Yorkshire Regiment, was fatally shot by a German sniper. He was a reservist, and prior to the war was employed as a conductor on the Leeds tramways.

## BUSINESS NOTES.

Trade Announcements,-Messes. T. Wainwright AND SONS, LTD., electricians, have removed from 257 to 329, Lord Street, Southport, their old premises being required for demoli-

THE LONDON AND RUGBY ENGINEERING Co., LTD., have removed to 36 and 37, Queen Street, E.C., which will also be the London address of THE RUGBY LAMP Co., LTD., and MESSES JAS. PROCTOR, LTD. Their telephone number "City 5252," and telegraphic address: "Cleodora, Cannon, London," remain un-

Russia.—H.M. Consul-General at Moscow reports that a firm in that city wishes to purchase, from United Kingdom manufacturers, electrical fittings and appliances. The firm is a large concern. Further communications should be addressed to the British Consulate-General, Moscow.

Bankrupicy Proceedings.—Albert Whiteley, electrical and mechanical engineer, Tudno Works, Tudno Street, Llandudo, Carnarvon.—The public examination of this debtor took place at the Magistrate's Room, Bangor, last week, when the statement of affairs showed an estimated deficiency of £310. The failure was due to want of capital, loss of money in former partnership and to the giving of long credit. The debtor stated that he commenced with borrowed capital, and had never been able to repay the loans. When in partnership he and his partner drew out about £55. a week. He made more than that as a workman. There were now no remaining liabilities of the partnership. When he commenced to trade on his own account he had about £50 worth of stock and borrowed about £40. Altogether he borrowed about £150 from his mother, which was still unpaid. He had borrowed other sums. He sublet part of his workshop for £10 a year. It coet him £8 plus rates and taxes. He used to obtain a fair amount of contract work apart from cinema contract work. He had kept two men regularly, and had to pay their wages whether he had work or not. He borrowed some of the money to pay a specified creditor. He had no account to show what profit or loss he had made. He claimed a substantial balance of an account against a cinema company, and an independent engineer had been called in who had not yet given his report. His claim was for £142. Of late he had drawn £2 a week out of the business which, however, could not really afford it. He had intended to offer a composition, but that idea fell through. The examination was closed, the Official Receiver remarking that the debtor had given every help in the elucidation of his affaire.

GEO DRIVER & SON, electrical and mechanical engineers, Hythe Road, Willesden Junction, N.W.—Receiving order made March 5th Bankruptcy Proceedings.—ALBERT WHITELEY, elec-

GEO DRIVER & Son, electrical and mechanical engineers, Hythe Road, Willesden Junction, N.W.—Receiving order made March 5th on creditor's petition. First meeting, March 23rd; public examination, April 22nd, both at Carey Street, W.C.

For Sale.—Walthamstow U.D.C. have for disposal one 160-kw. and one 133-kw. vertical Westinghouse gas engines, direct coupled to 460-volt D.C. generators. Tenders by March 24th. Particulars are given in our advertisement pages to-day.

Catalogues and Lists.—Edison & Swan United Electric Light Co., Ltd., Ponder's End.—Two new cards—one a postal card and the other a folder. The former gives prices of Royal Ediswan drawn-wire lamps; the latter gives fuller information, prices and illustrations of the same lamps. Both bear in colour a new Ediswan pictorial design for war time, the object of which is to emphasise that the lamps give a strong and penetrating light, and, we suppose, will stand anything. A publicity novelty in the shape of a small blotter has also been received.

JACKSON ELECTRIC STOVE CO., Ltd., 38. Blandford Street.

JACKSON ELECTRIC STOVE Co., LTD., 38, Blandford Street, London, W.—Two price cards (Nos. 9 and 10) with illustrations and brief particulars of their electric grills and breakfast cooker

and brief particulars of their electric grills and breakfast cooker respectively.

GENEBAL ELECTBIC CO., LTD., 67, Queen Victoria Street, E.C.—Leaflet No. H 1,858, illustrating and describing Magnet portable electric cookers, models A and B.

THE ST. HELENS CABLE AND RUBBEE Co., LTD., Warrington.—Booklet giving the actual experience of users of cab-tire sheathed cable, with other information. The uses referred to include the wiring of chemical works, outdoor cranes, collieries, dye works, galvanising tanks, ironworks, lavatories, soap works, stables, and many other difficult situations, such as motor-cars, lifts, &c.

THE EDISON AND SWAN UNITED ELECTBIC LIGHT CO., LTD., 123-125, Queen Victoria Street, E.C.—Leaflet relating to Ozonair apparatus, to which a display has been organised at the above address, machines being shown suitable for a variety of domestic and business purposes.

and business purposes.

Book Notices.—The February number of the Journal of the Tramways and Light Railways Association contains extracts (including table matter) from the Board of Trade return respecting the working of tramways, light railways and railless trolley

ing the working of tramways, light railways and railless trolley systems for 1913-14; also interesting excerpts from the report of the London Traffic Branch of the Board of Trade.

Annuaire de l'Electricité. Paris: La Lumière Electrique. Price 4 fr.—This is the second edition of a very useful publication, containing a mass of information relating to the electrical industry in France. More than half the volume consists of a list of towns and villages which have a supply of electricity, with the name of the supply authority, particulars regarding the supply, and the tariff. Hamlets of a few hundred inhabitants are included, and we notice one of only 29.

the supply authority, particulars regarding the supply, and the tariff. Hamlets of a few hundred inhabitants are included, and we notice one of only 29.

Other sections deal with traction, electricity companies, public bodies and societies, legislation relating to electricity, educational institutions and personnel, the electrical Press, and electrical manufacturers. The work is very complete, and should prove useful to many who have business relations with our Ally.

The Relsy Automatic Telephone Co., Ltd., of Marconi House, London, have issued a booklet describing the system devised by Messrs. Betulander and Palmgren, of which an account was given in the Electrical Aleview of July 10th, 1914; the method of operation of the numerous relsys upon which the system wholly depends for its action is difficult to follow, but in this booklet excellent diagrams are given, showing the successive operations clearly, with explanatory letterpress, and illustrations of actual apparatus. The revolutionary character of this system, as compared with all previous automatic systems, and the importance of the new departure thus made, were emphasised in our pages at the time of its introduction.

Universal Electrical Directory (J. A. Berly's). 34th Annual Edition. London: H. Alabaster, Gatehouse & Co.

Trade with Canada.—In accordance with the practice that has been established for H.M. Trade Commissioners in the British Self-Governing Dominions to visit the United Kingdom officially from time to time, so that manufacturers and merchants may have the opportunity of consulting them on any matters connected with their business, or of obtaining information as to the possibilities of extending their trade, it has been arranged that H.M. Trade Commissioner for Canada (Mr. C. Hamilton Wickes) shall shortly pay an official visit to this country. H.M. Trade Commissioner's visit is particularly opportune at the present time, when United Kingdom manufacturers are attempting to capture trade hitherto done by German firms in Canada, and it is anticipated that a very large number of firms will wish to take advantage of this opportunity to consult him. Among the matters in regard to which he is prepared to give information and advice are the appointment of agents, methods of marketing and distribution, terms of payment, names of probable buyers of British goods, statistics of imports, and rates of Customs duties, in Canada.

Mr. Hamilton Wickes will attend first at the offices of the Commercial Intelligence Branch of the Board of Trade in order to meet representatives of those firms who may be able to see him in London, and afterwards he will visit such trade and industrial centres in the provinces as it may appear most advantageous to visit in view of applications that may be received from firms in or near those centres, and from Chambers of Commerce.

near those centres, and from Chambers of Commerce.

In order that appointments may be satisfactorily arranged, firms who may desire to have an interview with Mr. Wickes are requested to make their applications as soon as possible. Such applications should be addressed to the Director, Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C. The reference number C.I.B. 10732/15 should be quoted.

British Trade with Nigeria.—Mr. C. A. Birtwistle, Commercial Intelligence Officer in Nigeria, the Correspondent of the Board of Trade for that Colony, who is now on a visit to England, will attend at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C., on Wednesday, Thursday and Friday, March 17th, 18th and 19th, between the hours of 10 a.m. and 5 p.m., and will be pleased to see, by appointment, British manufacturers and traders who may desire to consult him regarding trade conditions and openings in Nigeria. Applications for appointments with Mr. Birtwistle should be made promptly to the Director of the Commercial Intelligence Branch

Exhibition. - Messrs. Ward & Goldstone are exhibiting a large range of their British-made electric pare tamps, torches, cycle lamps, novelties, &c., at the Toy Fair and Market, which opens at the Agricultural Hall, Islington, on March 16th. Purchasers of these lines will be welcomed at Stand

Dissolution.—PARKER & JUBB, electrical engineers, King Street, Wakefield.—Messrs. P. Parker & S. Jubb have dissolved partnership. Mr. E. A. Fowlie, of 15, King Street, Wakefield, will attend to debts.

Exhibition Postponed.—The Shipping, Engineering and Machinery Exhibition, which was to have been held at Olympi last September, and was postponed on account of the war, is to be further postponed until August and September, 1917.

## LIGHTING and POWER NOTES.

Australia.—The Taree (N.S.W.) Municipal Council proposes to establish an electricity undertaking in the town, and an inquiry was to be held into the question of borrowing money to finance the scheme.

The Campbelltown (N.S.W.) Municipal Council has decided to recommend the ratepayers to adopt electricity for street lighting, and has resolved to obtain expert advice with regard to the cost of the installation.

The Tenterfield (N.S.W.) Municipal Council propos

£6,200 for the purpose of establishing electricity works.

The Warwick (Queensland) Municipal Council has adopted the report of the Government hydraulic engineer on the Canning Downs water scheme; the energy for pumping purposes is to be obtained from the Warwick Electric Supply Co.—Tenders.

Bacup.—Public Lighting.—The T.C. is substituting electricity for gas lighting on the Todmorden Road.

-Workhouse Lighting.- In view of further information, the B. of G. has decided to reconsider the question of producing its own current for lighting the workhouse, with a view to the supply being obtained from the North Metropolitan

Batley.—Loan Sanction.—The L.G.B. has sanctioned the borrowing of £6,500 for electric cable extensions in the districts of Healey, Staincliffe, Carlinghow and Bradford Road

A Sub-Committee has been deputed to consider tenders for transformers and switchgear, and also to report as to the provision of sub-stations, &c., in connection with the proposed cable

Blackburn.—RESTRICTED LIGHTING.—The order for reduced lighting which has now come into force, affects the public arc and tramway lighting, while outside shop lighting is prohibited.

Bexhill.—COAL PRICES, &c.—The T.C. has decided to pay the contractors an additional le. 6d. per ton over the contract price for the supply of coal to the electricity works. The Electricity Committee has reduced the public lighting account by £51 for the three months ended December last owing to the restricted lighting. It was stated that instructions had been given for further reductions in the lighting of the streets.

Bradford.—The Electricity Committee has decided that, pending the settlement of the wages question between the Federated Employers and the Amalgamated Society, and commencing immediately, a 15 per cent. war bonus be paid to the mechanics, smiths, fitters and other workmen in the electricity department

ELECTRIC COOKING. - An official inspection of the electric cooking installation at the Kurssal (Queen's Hall), by the members of the Council, took place on Tuesday evening.

The Lord Mayor occupied the chair at the dinner which followed,

and which was cooked electrically.

In the course of the evening, Mr. R. S. Downe, on behalf of the Brompton and Kensington Accessories Co., Ltd., who supplied the installation, referred to the advantages of electric cooking, and to the up-to-date character of the Kursaal equipment, which is designed to provide a table de hôte dinner for 500 persons. In an ordinary middle class house he said the cost of electric cooking. ordinary middle-class house, he said, the cost of electric cooking would not exceed 1½d, per head per day, with energy at 1d. per unit. In the B. and K. electric restaurant the energy used did

not exceed 3 unit per head, and if they had 250 meals a day, he would guarantee that the energy for cooking would not exceed 3 unit per head. Amongst the apparatus installed are a central range fitted with Bain Marie and four ovens, a circular steamer, fish frier, grill and water urns. In the ground floor café a carving table and hot cupboard, tea urns, a toaster, cooker and hot-water table and hot cupboard, tea urns, a toaster, cooker and hot-water geyser are provided, while further apparatus is fitted in the middle café. Electrically-heated towel-rails are provided in each of the cafés, these and a geyser for the wash-bowls having been supplied by the British Electric Heater Co., Glasgow.

The Corporation has appointed the Chairman of the Electricity Committee and the Town Clerk to represent it on a Joint Committee of representatives of West Riding County Boroughs, who have lodged petitions against the Yorkshire Electric Power Bill, to watch the interest of the combined authorities.

Burton-on-Trent.—RATE RELIEF.—A sum of £4,000 is to be appropriated from the electricity and gas departments in aid of the rates, subject to the approval of the Council.

Cahirciveen (Kerry).—E.L. SCHEME.—A public meeting was held during last week to consider a proposal for the electric lighting of the town. Mr. E. L. Cantwell, of the Ampere Electrical Co., explained the scheme, and a Committee was formed to canvas the district.

Canada.—Amongst the contracts reported to have been placed in connection with the war is one for the supply of 300 electric heaters for use in the trenches.

Chertsey.—The Ascot District Gas and Electricity Co. has informed the R.D.C. that it has been decided to reduce the price for current in the whole district of Ascot to 6d. a unit, flat rate, for lighting purposer. The consumers in the Woking area would thus be entitled to the same terms.

Continental Notes.—Norway.—As previously reported, the order for the six generators and turbines for the new power station, Bjukan II, of the Norwegian Hydro-Electrical Co., was placed with the Allmana Svenska Elektriska A/B, and these are the largest hydro-electric sets in the world. The work of installation has now been going on for some time, and the first generator was recently run on trial. The result showed a maximum capacity of 18,900 KW.

Before the war there were rumours that the Norwegian A/3 for Electrochemical Industry was carrying on negotiations with the Government for the purchase of energy from some large waterfalls Government for the purchase of energy from some large waterfalls at Hemnas, in Ranen, belonging to the State. Ranenfjord is situated about on the same latitude as the Polar Circle. Last year the company bought two large deposits of limestone in the neighbourhood, and negotiations for a third one have been completed, thus providing materials for the future manufacture of nitrates or kindred products. As the company occupies a strong financial position, it is not improbable that the district, in a few years' time, may be turned into an industrial centre like Rjukan. The available energy of this district is roughly estimated to amount to more than 200,000 H.P.; a portion of it will, no doubt, be reserved for the electrical smelting of iron ore, and for a projected electrical railway from Trondbjem to Bado, but there will still be sufficient left for the nitrate industry or the electrochemical industry. chemical industry.

A new company—the A/3 Blasfildene—has been formed to acquire the water rights of the River Blaselven, in the province of Sondhardland in Western Norway, which will produce 100 000 HP. The company has also bought a large area of ground at Indre-Motre, suitable for sites for the future electrical works and factories, and an application for the necessary concession has been submitted to the Government. The capital of the new company is £27,800, which, however, will be increased when the concession is in order

is in order.

The Faaberg Municipality, in the neighbourhood of the town of Lillehammer, has decided to take up a loan of £5,500 for the purpose of distributing electrical energy among the inhabitants.

At the well-known tourist centre of Balestrand, in Western Norwsy, an electrical station, deriving power from two small rivers in the neighbourhood, has been built.

The parish of Basde, near Fredrikstad, has decided to erect a sub-station to be supplied from the Kykkelarud works—which supply Christiania—and to distribute energy in the neighbourhood.

The parish of Skaanevik has recently approach the sub-station of Skaanevik has recently approach the supplied to the supplied to the supplied to the supplied from the Kykkelarud works—which supply Christiania—and to distribute energy in the neighbourhood.

sub-station to be supplied from the Kykkelarud works—which supply Christiania—and to distribute energy in the neighbourhood. The parish of Skaanevik has recently secured the water rights of the Lia River, in Motre, and will develop 5,000 H.P., which is sufficient to cover the requirements of the district.

The authorities of the Province of Akershus, to the north of Christiania, have purchased the large Remasfos, which is a waterfall capable of delivering 25,000 electrical H.P. The price was £55,000, and it was originally intended to develop the fall at once, but this may be deferred owing to financial difficulties. The probut this may be deferred owing to financial difficulties. The province of Akershus has a population of 130,000, and some of the parishes have no supplies of energy as yet. The project is not connected with any large industrial enterprise, as the whole amount will be needed by the population at the rate of  $\frac{1}{3}$  H.P. per capita.

Cuba.—The following persons have been granted permission to install electric generating and lighting plant in Cuba:

Senores Maristany and Florez Estrada, at Campo Florido, Province of Havana; Senor Galvani, in the town of Antilla, Province of Oriente; Senores Pollo and Herrera, at Coliseo, Province of Matanzas; and Senor Cuesta, in Arroyos de Mantua, Province of Pinar del Rio.—B. of T. Journal.

Darlington.—Proposed Loan.—The T.C. has decided make application to the L.G.B. for sanction to a loan of

to make application to the L.G.B. for sanction to a loan of £13,000 to meet the expenditure for mains, services and transformers during the next three years.

In answer to the Corporation's representations, the L.G.B. has extended the period for the repayment of a loan of £9,500 for mains, services and transformers, from 15 to 25 years, and in respect of another loan of £1,690, half to be paid in ten years (the original period fixed), and the other half in 20 years.

-RAILWAY SUPPLY.—The T.C. has concluded an agreement with the South-Eastern and Chatham Railway Co. for a supply of current to the new Pier Station. The Council will supply up to 15,000 units a year at 4½d., and beyond that at 31d. per unit.

Dublin,—The City Electricity Committee has agreed that no commission be paid to canvassers bringing in orders unless with a guarantee from consumers to use £5 worth of electricity

annually for five years.

The Chairman of the Dublin (Electric) Tramways Co., replying The Unairman or the Dublin (Siectric) Tramways co., replying to statements made at the last Corporation meeting as to the relative charges for electricity in Dublin and Cork, says the Cork Co. supply power to private users in some cases as low as \{d. per unit, while the charge for tramway power is still lower—viz., '61 of a penny. The average price for light and power in Cork is 1'95d. per unit assists a Dublin average of 2'90d unit against a Dublin average of 2.99d.

Eastbourne.—New Turbine Plant.—The T.C. has adopted the recommendation of the Electricity Committee to purchase a 1,250-kw. Ljungstrom turbo-alternator, at a cost of

Fleetwood.—School Lighting.—The Education Committee has decided to light a new school by electricity, and the U.D.C. is to be asked to extend its mains for the purpose.

Fowey.-E.L. SCHEME.-The T.C. has referred to the Lighting Committee a communication from Mr. H. O. H. Wenman, of Wolverhampton, regarding an electricity scheme for the town. He offers to establish the works, and to supply electricity at 6d. per unit, the Council to have the option of purchase at the end of 14, 21 or 28 years.

Gillingham (Kent).—The T.C. has asked the Chatham T.C. to consent to Gillingham laying E.L. mains in the borough of Chatham, such consent to cover future cases, on the understanding that as soon as the mains for the Kent E.P. Co. are laid in the locality, the Council will cease to supply current. The Chatham Council recently refused a similar request.

-GAS FIRING.—A Joint Committee of the Electricity and Gas Committees has under consideration the ques-Electricity and Gas Committees has under consideration the question of providing appliances for the gas firing of boilers at the generating stations, and the extraction of the tar, &c., from the coal carbonised. It has been decided to arrange for a joint experiment with the Maclaurin process, as the same type of apparatus used in that process is also used for the production of smokeless fuel. The electricity department is in a position to use the gas during experiments for firing the boilers at the generating stations where the plant will be installed.

Grimsby.—The T.C. last week, by 17 votes to 16, decided to postpone the new battery scheme for six months

Heywood.—L.G.B. Inquiry.—An inquiry was held on March 5th respecting the application of the Corporation for permission to borrow £12,460 in connection with the arrangement whereby a bulk supply of electricity is to be taken from the Bury whereby a bulk supply of electricity is to be taken from the Bury Corporation. The inspector announced that the L.G.B. was acting in conjunction with the Treasury, and that no borrowing powers would be sanctioned during the war except under extraordinary circumstances and for work required to be done to execute Government contracts. Everything that was proposed to be done would have to be shown to be absolutely necessary. The electrical engineer stated that several local firms were executing Government contracts and had applied for electricity for power proposes. contracts and had applied for electricity for power purpose

India.—On February 1st, the Commissioner in Sind opened the central generating station of the Karachi Electric Supply Corporation at Karachi.

Kingstown.—E.L. Scheme.—The U.D.C. has received application for immediate payment of £3,067, the amount of the arbitrator's award in connection with the promotion of the electric light scheme.

It is estimated that the cost of the transfer of the undertaking will be about £5,000; the Electric Lighting Committee recommends that the Council should now formulate an electric lighting scheme, and apply to the L.G.B. for the necessary loan.

Leeds.—L.G.B. INQUIRY.—On Friday last an inquiry was made into the application of the Corporation for power to

was made into the application of the Corporation for power to borrow £25,000 for further electrical plant.

At a meeting of the City Council last week the question was raised of the permission which had been given to the Yorks Electric Power Cc. to supply electricity in various parts of Rodley; it was pointed out that if the Corporation ultimately found itself in a position to provide the supply, the company would be bound to withdraw.

Llandudno. — Proposed Loan. — The U.D.C. has applied for a loan of £1,720 for additional plant, &2., at the elec-

London.--L.C.C. LOANS.—The Treasury has intimated London.—L.C.C. Loans.—The Treasury has intimated that it is undesirable to incur capital expenditure at the present time, and has asked that applications for sanction to loans of £28,000, including £5,000 for Battereas B.C. and £10,000 for Hammersmith B.C., both for electricity purposes, should be reconsidered. Pending a definite statement from the Treasury, the Council is withholding advances to local authorities, and is postponing the completion of loans already agreed to.

HACKNEY.—The Electricity Committee reports as to the negociations with the trustees of Messre. Allen & Co. in the action, Allen & Co. r. the B.C., and recommends as a basis of settlement that the Council make payment to the trustees of £1,090 and £350, the latter sum being in lieu of returning the plant taken over by the Council; also payment of 17 guineas on insurances paid by the trustees.

paid by the trustees

The Special Committee of the BC. appointed to consider the subject of the accountancy at the electricity department recommends that no alteration be made in the present system of dealing with the accounts of the undertaking, but that the annual stocktaking be carried out by independent stock takers in future, and that professional accountants having experience in the audit of electricity securats be emplyed each year to conduct a commercial audit of the accounts of the electricity department, independently of the L.G.B. auditor.

LONDON ELECTRICITY SUPPLY.—The Special Committee of the L.C.C. repures that it has had under consideration the situation created by the fact that the proposed Bill will not be proceeded with in the present session, with a view to deciding whether or not it would submit any further proposals to the Council in the

matter.

FULHAM.—As owing to abnormally low tides difficulty has been experienced at the electricity works in obtaining sufficient water for condensing purposes, a survey is to be made of the river bed near the works.

Loughborough.—ELECTRIC HEATING AND COOKING.-The T.C. has discussed at some length a report by the electrical The T.C. has discussed at some length a report by the electrical engineer on the subject of electric heating and cooking supply, and has adopted a tariff of 12½ per cent on the rateable value of the house, plus ¾ 1. per unit. In opposing this decision, the chairman of the Gas Committee suggested that it was a plot to get hold of the gas heating and cooking, intimating that there were 4,000 gas stoves in the town, representing £15,000, and he could not think the Council would be so foolish as to throw that amount away. Nevertheless the Council, as reported, decided to be "foolish," and give electricity consumers the opportunity of adopting electric heating and cooking.

Manchester. — Barton Scheme. — Owing to the Treasury withholding sanction to the raising of new capital, the carrying out of the Barton extension scheme will be delayed. It is understood that the Committee will endeavour to commence the work in the coming year.

Middleton.--Public Lighting. - A scheme has been approved for lighting Long Street and Rochdale Road by means of 14 half-watt lamps

New Zealand.—The lighting returns of the Wellington City electricity department shows that for the nine months ended December 31st last 297,834 more units were sold than in the corresponding period of 1913.

corresponding period of 1913.

The scheme of the Dominion Portland Cement Co. to obtain power from the Wairus Falls, for a modern cement mill at Tikorangi, on the south shore of the Whangarei Harbour, is making rapid progress, and the mill is expected to be working in September next, with an initial annual output of 60,000 tons; the whole project involves a capital expenditure of £200 000.

The contract for the pipe lines and turbines has been placed with Messrs. Boving & Co., the erection of these on the site will be carried out by Messrs. G. Fraser & Sons; two 1,500-H P. generating sets are being installed, but the station is planned for four such units. The transmission will be worked at a pressure of 22 000 vol s.

22 000 vol s.

The transmission line from the river to the company's works has been completed, and a branch line from the works to Whan-garei is expected to be completed this month, making a length of transmission line of 22 miles. The Whangarei Council is starting its electricity scheme, and the lighting of the town is expected to be complete in May.

Nuneaton.—The T.C. has decided to carry out a modified scheme for the supply of current to the Stocking ford district, at a cost of £1,75%, for mains. The scheme will, for the first few years, entail a loss of £140 a year, but it is estimated that after three years' working the extension will show a profit.

Pembroke (Co. Dublin).—The Council has decided. in view of the increase in capital and other charges, and the prospect of a further rise in the price of coal, to make a 5 per cent. temporary increase on electric light accounts for 1915-16.

-Mr. W. J. Howard, mains engineer in the electric supply department, has devised a special system of power transformer protection. It has been adopted by a firm of electrical switchgear manufacturers on royalty, and 40 of these protective devices have been installed on the Corporation apparatus,

resulting in a saving of capital expenditure.

The Corporation has been recommended to petition against the Yorkshire Electric Power Bill. The L.G.B. has decided to issue the prov. order applied for by the City Council to amend the "Sheffield Electric Lighting (Transfer) Act, so as to enable the Corporation to erect shops in connection with the proposed new offices in Bow Street. The Electric Supply Committee proposes to extend mains in various parts of the city, at a cost of approximately £4.950. £1,950.

Shipley.—Textile Driving.—The U.D.C. has concluded an agreement with Meser. Frank Hartley & Cr., wool-combers, to supply current for an electric drive throughout their works. The firm will be the Council's largest power consumers.

Shelton and Brotton.—The U.D.C. has decided that in cases where installations for the E.L. are provided by firms on the instalment system, the instalments due shall be collected by the Councu's collector when calling for payments due to the Council.

St. Anne's,—Public Lighting.—The chairman of the Electricity and Lighting Committee and the electrical engineer

Electricity and Lighting Committee and the electrical engineer are to prepare a report upon the lighting of the Ashton Gardene.

In a report submited to the U.D.C. this week, it was stated that the consumption of electricity for heating purposes showed a steary increase under the stimulus of the reduced price and more efficient heaters. The increased consumption for industrial purposes is also regarded as satisfactory in view of the limitations to that demand in the resort.

Stafford,—A Special Committee, which has had the matter under consideration, has been unable to make any reconmendation as to constituting separate Committees for gas and electricity. The Council has asked for a further report.

Wimbledon.—The Electric Lighting Committee has decided to hire out electrical irons at a charge of 1s. per quarter.

Walsall.—It is proposed to adopt revised scales of waisall.—It is proposed to adopt revised scales of charges for energy for power purposes; for D.C. or low-pressure A.C. the price will vary from 1½d, per unit for under 500 units per quarter to 1½d, with discount, for over 3.750 units. For bulk supply to factories the price will range downwards per KW. per quarter from £1 10s for over 20 KW. demand, plus '35d, per unit'. Special bu k supplies of alternating current will be given at prices ranging from 11d, to '55d, per unit based on consumption and load factor. For electric vehicles, 1½d, per unit will be charged off peak, minimum 2s, 6d, per charge. The B. of T. has sanctioned the alteration of the system of supply from D.C. to A.C.

PROPOSAL.—The Liverpool -Linking-up Waterloo.-District Lighting Co., Ltd., is applying to the B. of T. for sanction to make a connection between its cables and those of the Botle T.O. at the boundary at Seaforth, in order to provide a duplicate supply in case of emergency, and has asked for the U.D.C.'s consent. The Council has referred the matter to a Committee, with power to act.

Wolverhampton.—The Corporation Electricity Committee has decided that the sum of £2,215 in aid of the improvement rate be included in the Finance Committee's estimates for the ensuing financial year.

## TRAMWAY and RAILWAY NOTES.

Bradford.—The Tramways Committee has instructed the general manager to pay full wages to any Bradford tramway employ 63 discharged from the Navy or Army owing to disablement received on active service, until such time as the question shall have been dealt with on general principles applicable to the entire Corporation services.

The new railless trolley route from Forster Square (City), to Bolton Woods, ria Canal Ruad, is now completed and awaiting

Board of Trade inspectior.

ROAD MAINTENANCE.—The Joint Street, D. ainage and Works and Tramways Sub-Committee has recommended that some annual contribution, on a basis to be determined later, be made by the Tramways Committee to the funds of the Street, Drainage and Works Committee, without projudice to the position of either of the Committees concerned, in respect of the extra expenditure found to be necessary for the maintenance of roads on railless trolley vehicle routes in the city.

Bury (Lancs.).—At the T.C. meeting last week it was stated that owing to the war the receipts of the Corporation tram ways showed a falling off of £150 a week, and the allowance to members of the staff who had joined the Army or Navy was £30 a week, which might be increased at a later date. There two items alone would take nearly £10,000 per annum, so that while the war continued the tramway undertaking would have as much as it could do to make both ends meet.

Doncaster.—The T.C. has sanctioned an expenditure of £5,300 on additional tramcars, and £1,800 on enlargement of tram sheds.

Glasgow.—A Special Committee of the T.C., consisting of the conveners and sub-conveners of all standing Committees, has been appointed to consider an application for an advance of wages by sections of employes in every Department of the Corporawages by sections of employees in every Department of the Composition's activities. In the tramway department the application is on behalf of all workers, excepting motormen and conductors, tradesmen at Coplawhill car works, set dressers, paviors, time-keepers, ticket inspectors, controller men at respective car dejôts, and foremen and clerks at head office; and in the electricity department, all employés excepting bricklayers, masons, foremen and meter inspectors.

Leeds. - THIRD-PARTY INSURANCE. - The City Council has signified its approval of a suggestion that the Corporation insurance in regard to the trisks in connection with third-party insurance in regard to the tramway undertaking. During the last three years the cost of the third-party insurance through insurance companies has cost over 1s, per 100 miles as compared with the former payment of 6d, for the same distance. If the Corporation took the risk itself it would be able to save at least

£3,000 per annum.

The Watch Committee has decided to purchase tokens from the Tramways Committee to be supplied to the special constables of the

Tramways Committee to be supplied to the special constables of the city in order that they may use the cars to convey them to and from points of duty without payment.

TRAMWAY EXTENSIONS.—The tramway department has completed the extension of the Guiseley line to the White Cross Hotel, near Menston, an addition of nearly a mile, and also the new depôt at the end of the line. Good progress is being made with the installation of the railless traction system into Wharfedale, and it is expected that cars will be running to Otlaw and Runlaw by May or Inne. Otley and Burley by May or June.

Leicester.—YEAR'S WORKING.—According to the statement of accounts of the tramway undertaking (including electric supply by direct current for power purposes) for the year ended December 31st last, the receipts (including interest on reserve fund investments) in excess of working expenses, and the cost of repairs and maintenance, amounted to £53,288. The interest and sinking fund charges, income-tax, bank interest, and allowances to employée on service in H.M. Forces amounted to £42,066, and sums amounting to £10,741 have been applied for various purposes, leaving a net balance of £479 to be varied to the district fund. The receipts in excess of working expenses and the cost of repairs and maintenance of the Aylestone electric lighting undertaking for the same year amounted to £22,712. After payment of interest and sinking fund charges there remains a net surplus of £7,643, which it is recommended should be carried to the district fund in relief of rates.

London. — The Highways Committee of the L.C.C. reports that the total safe working overload capacity of the plant reports that the total safe working overload capacity of the plant at the Green wich generating station, excluding No. 2 reciprocating engine, which will shortly be dismantled, is 39,000 kW, and with the 3,500 kW. additional supply about to be obtained from the Lundon Electric Supply Corporation, the total capacity is 42,500 k.W. The present load on the station plant is 32,000 kW, so that the capacity of the spare plant will amount to 10,500 kW. The Committee recommends that, in order that more spare plant may be available and additional cars may be run, a further reserve supply of about \$,000 kW. be obtained from an outside source. The cost is estimated at £11,800 for cables, ducts, &3.

Mu-selburgh. — STRIKE. — Much inconvenience caused last week by a strike of the drivers and conductors of the Musselburgh District Electric Tramwsy Co.

Sheffield.—In addition to the £2,000 paid annually into the tramway special purposes fund, the Tramways Committee of the Corporation has resolved to pay an additional £600 for the years ending March, 1915 and 1916, out of the tramway accumulated surplus fund.

-The Swinton branch of the Amalgamated Association of Tramway and Vehicle Workers has decided to apply for an increase of 15 per cent, in wages on account of the higher cost of food. There are about 200 members in the branch, all of whom are employed by the South Lance. Tramway Co.

- YEAR'S WORKING. -- The accounts of the tramway undertaking for the year ended December 31st last show a profit of £2,478, after deducting £368 in respect of the final a profit of £2,478, after deducting £368 in respect of the final instalment of cost of alterations and extensions at the Birchills dejôt; £271 in respect of balance of cost of alterations and extensions at tramw.y. offices on the bridge, and £1,000 in respect of contribution in aid of rates of 1914. Working expenses during the 12 months amounted to £21,821, or 7.267d, per car-m:le (as against 7.209d, in the previous year), made up of £8,509 in respect of traffic expenses; £5,670 for power expenses; £4.314 for general repairs and maintenance, and £3,825 for general expenses. Traffic revenus brought in during the year £33,310, or 11.094d, per carrepairs and maintenance, and £3,325 for general expenses.

revenue brought in during the year £33,310, or 11 094d. per carmile (as against 11 007d. in the previous 12 months), which, with sundy other items, brings the total revenue up to £34,089. The Council is recommended to appropriate the net profit as follows:—£2,000 in aid of the rates, and £478 towards the cost of the siding in St. Paul's Street and Darwall Street.

Wolverhampton.—Rate RELIEF.—The Tramways Committee has allocated £4,018 to the borough rate from the profits of the tramway undertaking in respect of the financial year ending March 31st next.

## TELEGRAPH and TELEPHONE NOTES.

Accrington.—The automatic telephone system installed at Accrington was expected to come into operation last week-end. The work has been carried out by the Automatic Telephone Manufacturing Co, of Liverpool, who have recently completed automatic exchanges in several places abroad, and have in progress similar equipments for Leeds, Portsmouth, Blackburn, Paisley, Newport, and Chepstow.

Cable Rates Reduced.—The Pacific Cable Board announces that the telegraphic rates to and from New Zealand will be reduced as from April 1st next. The ordinary rate, now 3. per word, is reduced to 2s. 8d. per word, and the deferred ordinary rate, now 1s. 6d. per word, to 1s. 4d. per word. The "Week-end" rate, now 15s. for 20 words and 9d. for each additional word, is reduced to 13s. 4d. for 20 words and 8d. for each additional word. There are also reductions in the rates to Suva (Fj.) and Norfolk Island, and in the rates between Canada and New Zealand.

- The coast wireless telegraph stations Woosung and Canton, completed for working last summer, have now started regular service; similar stations at Foochow and Hankow are expected to be completed within the next few months. The stations are all of the same construction, each being provided with two masts of a height of 200 ft., giving them a range of 700 nautical miles by day and at least 1,300 nautical miles at night.

Guernsey.—The balance-sheet of the Guernsey States Telephone Department for 1914 shows a total revenue of £7,530, and an expenditure of £6,761, including £2,066 depreciation and and an expenditure of £6.76°, including £2,066 depreciation and sinking fund payments, and £876 for interest on capital; the net profit for the year was £769. The total capital outlay on construction account was £49,154, provided by a loan of £32,000 raised in 1905 (of which £3,251 has been repaid), and £17,154 taken from the reserve funds, which, including this amount, stand at £21,944. The number of subscribers lines at the end of 1914 was 1,772, and the total of all winds 2.152 with a milescence of 1508 miles of over the number of successful hierarchies at the old of 1914 was 1,772, an increase of over-head line and 1,050 miles underground, showing increases of 62 and 235 miles respectively. The number of calls in the year was 1,571,721, an increase of over 200,000. The net profit in 1913 was £763.

Hull.--The City Council has instructed the Telephones Committee to make a thorough investigation with regard to the Committee to make a thorough investigation with regard to the unsatisfactory working of the telephone system, which, in Hull, is the property of the Council. It was alleged that the tariff had been great y increased, and that the service was most inefficient; in defence the inefficiency complained of was ascribed to the loss of a large number of skilled men through the outbreak of war, and to stormy weather.

Telephone Tariffs.—It is reported that in present circumstances the Government has decided to postpone the introduction of revised telephone rates.

Wireless Control Ship.—According to the Journal Télégraphique, the United States Government has equipped a vessel with apparatus for quickly measuring wave-lengths; it will cruise in the Atlantic and will ascertain whether wireless stations conform to the rules relating to the wave-lengths that they must use. It has been noticed during the past year that the regulations are often neglected. The control ship will also take steps to prevent often neglected. The control ship will also take steps to prevent the emission of alarm signals in cases that are not urgent, as has often happened.

Wireless on Aeroplanes.—It is reported from the front that a number of our aeroplanes carry wireless apparatus with which they are capable of signalling to their headquarters, and that it has been found possible, as the result of a wireless signal from the air, for the artillery to locate and hit a moving object before it could reach shelter.

## CONTRACTS OPEN and CLOSED.

OPEN.

Aberdeenshire. - Tenders wanted for electric light work at new parish church, to be erected at Cults, Aberdeenshire, A. M. Mackenzie & Son, Architecte, 343, Union Street, Aberdeer.

Australia.—MELBOURNE.—March 16th. White Wheat-stone receiving tape, for Postmaster-General. See "Official Notices" February 5th.

SYDNEY.—March 23rd. One 150-ton electric revolving fluating crane for Naval Dockyard, Sydney. Particulars may be seen at the Board of Trade Commercial Intelligence Branch in London, and a cabled price will be admissible.

Balls Bridge (Dublin). March 15th. U.D.C. Twelve months' supply of electrical stores. Specification from the Town

Belfast.—March 15th. Twelve months' supply of stores for the Tramways and Electricity Committees, See "Official Notices" February 19th,

Burnley.- March 22nd. Electricians' work for the B. of G. Forms, &c., from Mr. J. S. Horn, Clerk, Union Offices

Carlisle.—March 31st. Corporation. Twelve months' supply of jointing materials, oils and general stores. Forms, &c. from City Electrical Engineer, Victoria Viaduct.

Darlington. — March 18th. Corporation. months' supply of (10,000 tons) small, rough small, or single nut steam coal. Forms, &c., from Electricity Works, Haughton Read.

Dundalk, — March 23rd. U.D.C. Twelve months' supply of stores for the Electricity Department. See "Official Notices" March 5th.

Halifax. — March 26th. Electrical fittings for six months, for the B. of G. Mr. A. T. Longbotham, Clerk, 4, Carleton Street.

Hounslow.-March 15th. Electric light fittings and telephone maintenance at isolation hospitals, Morden and Dockwell, for Richmond, Heston and Isleworth Joint Isolation Hospital Committee. Mr. F. C. Greville-Smith, Clerk, 213, High Street, Hounslow.

Hove. - March 26th. Corporation. One 500-kw. mixed-pressure steam turbine, complete with D.c. 230/285-volt generator and surface condensing plant; also a battery of 115 accumulators. See "Official Notices" March 5th.

-March 20th. Corporation. Six or 12 months' supply of coal for the Tramways Committee. Forms, &c., City Engineer's office.

Kirkcaldy.—March 22nd. Corporation. Twelve months' supply of brass castings, pitch, iron castings, &c., for the Electricity and Tramways Committee. Forms of tender from Mr. O. F. Francis, Burgh Electrical Engineer.

Liverpool.—March 12th. Electrical fittings for a year for the Select Vestry.

-L.C.C.—March 16th. Reconstruction of three London.miles of single-line tramway on the underground conduit system. Specifications, &c. (£5), from Chief Engineer, County Hall, Spring Gardens, S.W.

The Highways Committee recommends that tenders be invited from selected firms for the provision and laying of additional cables, in connection with the Council's tramways.

HORNSEY.—March 16th. Meters, cables and stores, &c., for the T.C. See "Official Notices" February 19th.
WANDSWORTH.—March 15th. B. of G. One month's supply of electrical fittings, for the Wandsworth Union. Forms of tender from the Clerk, Union Offices, St. John's Hill, S.W.

Londonderry. — March 13th. Corporation. Engineroom stores, carbons, meters, bitumen, fuse-boxes.

New Zealand.—Wellington.—April 30th. Supply of a three-unit exciter set, and 1,600-kw. generator for the Lake Coleridge Hydro-electric scheme. Specifications from the Pablic Works Office, Wellington.

Rugby.—March 15th. 10,000 tons of peas, beans, D/S nuts, for the directors of the British Thomson Houston Co., Ltd. Particulars from Mr. W. J. Terry, Supervisor of Purchases.

South Shields.—March 12th. Twelve months' supply of engine-room stores for the electricity works.

Spain. - March 27th. Spanish Post and Telegraph authorities, Madrid. Concession for the establishment and working for a period of 20 years of a telephone exchange in the town of Guardiola (province of Barcelona).

The municipal authorities of Zwigens (province of Almeira) have recently invited tenders for the concession for the electric lighting of the town during a period of 20 years.

Swindon.—March 13th. Corporation. Twelve or six months' stores for Electricity and Tramway Departments. See "Official Notices" February 19th.

Swinton and Pendlebury.—March 19th. Cables, joint-boxes, bitumen and joint-box compound. See "Official Notices" March 5th.

Transvaal. — Bethal. March 25th. Municipality. Supply and erection of generating and pumping plant and overhead electric distribution system. Specifications from the consulting engineer, Mr. H. Hancock. P.O. Box 62, Klerksdorp (deposit £1 18.).

Walthamstow.—March 24th. U.D.C. E.H.T. and L.T. switchgear and cables. See "Official Notices" to-day.

Warrington.-March 16th. Motor, cables, and E.H.T. feeder panel, for the Electricity Department. See "Official Notices" March 5th.

Wigan.-March 16th. Corporation. Supply of stores for the Electric Light Department. See "Official Notices" March

Wretham,-March 17th. Meters, oils, coal, &c., for the Corporation Electricity Department, for a year. Borough Electrical Engineer, Willow Road.

#### CLOSED.

Australia.—The following contracts have been placed:—

Australia.—The following contracts have been placed.—
Perth (W.A.) Municipal Council.—
Switchgear (to replace the A.E.G. switchgear).—British Westinghouse Electric & Mig. Co., Ltd., 27,250.
Melbourne City Council.—
7,330 yards of single conductor lead-covered cables.—Glover & Co., \$2,819.
Victorian Railways Department.—
25 battery signal machines.—Aust. General Electric Co., £925.
P.M.G.'s Department, Queensland.—
26,750 Siemens Obach d'y ce'ls.—Siemens Bros. Dynamo Works, £954.
—Tenders.

Bacup.—The Electricity Committee has accepted the tender of Mr. G. L. Adamson, Roohdale, for wiring and fitting the Market Hall, shops in Lordship Street, municipal offices, Sanitary Inspector's offices, public conveniences and fire station; and that of Messrs. Macintosh & Co., Ltd., for rubber cables.

Bridlington.—The T.C. has accepted the tender of Mr. George Robinson for electrical work on the New Spa.

Burton-on-Trent.-The tenders of Mr. R. B. Barratt for 5,000 tons of fine slack, and of Messrs. Marriott & Co. for 1,000 tons, have been accepted by the T.C. E'estricity Committee.

Bury (Lancs.). — The Borough Insurance Committee

has accepted the tender of Mr. John Jardin, Bury, for installing the electric light at their premises.

The Electricity Committee has accepted the tender of the Bilton Stone and Concrete Co. for the construction of a reinforced concrete retaining wall at the Chamber Hall power station.

Colchester.—The tender of Messrs. Siemens Bros. Dynamo Works, Ltd., for carbon and metal-filament lamps for the Corporation tramways for 12 months, has been accepted.

Darlington,-The T.C. has accepted the tender of Messre. Fraser & Chalmers, of Erith, for a 3,000 kw. turbine and Siemens alternator.

Dartford. - The U.D.C. has accepted the following

tenders for coal for the electricity works:—

John Hudson & Co., Ltd.—178 tons of South Hetton, £1 2s. 8d. per ton.

E. J. & W. Goldsmith, Ltd.—200 tons of Rubbly Cuim, 15s. 4d. per ton.

Bradbury, Son & Co., Ltd.—120 tons of 1½-in. Nailstone, £1 per ton, and 800 tons of 1½-in. nutty slack, £1 1s. per ton.

Elland.—The U.D.C. has accepted the tender of Mr. Newsome, for 1,000 tons of Hodroyd engine nut coal for the electricity works, at 12s. 10d. per ton.

Gloucester. - The T.C. has accepted the following tenders for coal for the electricity works from March 15th to August 15th :-

Park Colliery Co. -1,000 tons of rough small steam, 15s. 10d. per ton. Mr. E. Javrets. -50) tons of No. 2 High Deif, 15s. 3d. per ton, and 300 tons of Yorkley steam, 15s. 6d. per ton.

Llandudno.—The U D.C. has accepted the tender of Messrs. Browett, Lindley & Co. for an engine for the electricity works, at £780; and that of the Electric Construction Co., Ltd., for a dynamo, at £425.

Liverpool,-The following tenders have been accepted for annual supplies to the Electricity Supply Department :-

**Sannal supplies to the Electricity Supply Department:—

Metal-filament lamps.—Pope's Electric Lamp Co., Ltd.
Carbon-filament lamps.—Edison & Swan Co.
Cast-iron troughs and boxes.—E. Wilson & Co.
Brass and copper castings.—Gallie Bros.
Insu'ated cables and wires.—Liverpool Electric Cable Co., Ltd., and
St. Helens Cable and Rubber Co., Ltd.
Stoneware troughing, insulators, &c. - O. Cooban; J. E. Beard & Co., Ltd.;
Callender's Cable Co., Ltd.; J. Bourne & Son; Liverpool Building
Material and Cemont Co., Ltd.

The following have been accented for annual supplies to the

The following have been accepted for annual supplies to the Tramways Department:—

Tramoar motor equipments.—D'ck, Kerr & Co., Ltd.
Steel gears and pinions.—British Hele-Shaw Patent Clutch Co., Ltd.
Iron castings.—Miller & Co., Ltd.; Moston Malleable Castings Co., Ltd.; and E. Wilson & Co.
Rubber goods, &c.—L. Andrew & Co.; Avon India-rubber Co., Ltd.; Hellewell & Co.; North British Rubber Co., Ltd.; New Liverpool Rubber Co., Ltd.
Cils, paints, &c.—Anglo-American Oil Co., Ltd.; Atlas Lubricating Co., Ltd.; Baxendale & Co., Ltd.; Bowring Patroleum Co., Ltd.; British Petroleum Co., Ltd.; John Matthews & Co.; R. R. Minton & Co., Ltd.; Wotor Benzole Co., Ltd.; Pice's Co., Ltd.; Johna Res & Sons, Ltd.; W. H. Samuel & Co.; Siddall & Co.; J. & J. Taylor & Co., Ltd.; United Alkall Co., Ltd.; Wilkinson, Heywood & Clark, Ltd.; and Wm. Wright & Sons, Ltd.
Varnishes and special paints.—Lewis Berg r & Sons, Ltd.; Meredith and Co.; Naylor Bros. (London), Ltd.; Sanitary Paint Co., Ltd.; and Wilkinson, Heywood & Clark, Ltd.
Lubricating cils and greases.—Vacuum Oil Co., Ltd.; Matthew Wells and Co., Ltd.

The following have been accepted for annual supplies to the

Lighting Department: —
Wrought iron lamp standards, brackets, &c.—A. B. Dalzell & Co.; Ashmore and Co.; Killick & Cochran.

Cast-iron lamp columns and plugs.—Killick & Cochran.

Messre Stewarts & Lloyds, Ltd., are to supply steel steam-pipes for connecting the boilers at Nc. 2 station, Lister Drive, with those installed at No. 1 station.

London. - WOOLWICH. - The following tenders have been accepted by the B.C. Electricity Committee:

Ferguson, Pailin & Co.—Switchboard extension, £62.
Babcock & Wile x, Ltd.—Two steam boilers with chain-grate stokers (duplicate of present installation), £7,126.
G. & J. Weir, Ltd.—Feed pump, £195.

HACKNEY.—The Electricity Committee has received the following tanders for pipework and valves for the 5,000 KW. turbo-alternator:

Meter Contracts.—The Llandaff and Dinas Powis R.D.

MCICY CONTRACIS.—The Mandah and Dinas Fowls R.D. Council and the Rhymney Valley and General Electric Supply Co. have both placed 12 months' contracts for single-phase meters with the Electrical Apparatus Co., Ltd.

West Ham Corporation has renewed its contract with Messrs. Venner & Co. for Chamberlain & Hookham A.C. meters for a further 12 months. Messrs. Chamberlain & Hookham, Ltd., have also received the Winchester contract for D.C. meters for the coming

New Zealand.—The Public Service Tender Board has accepted the following tenders:

7,000 table telephones.—B. L. Donne, £2,483.

New Zealand Shipping and Commerce.

New Zealand Shipping and Commerce.

Sheffield.—The Electric Supply Committee has resolved to accept the following tenders in connection with the extension of the Neepsend power house:-

Stirling Boiler Co., Ltd.—Water-tube boilers, mechanical s'okers, super-heaters, economisers, pipework and all accessories. £31,153.
George Longden & Son, Ltd.—Extensions to the engine room and boiler house, new switchrooms and stores, £21,799.
Thomas Smith & Sons.—50-ton overhead electric travelling crane, £2,102.
Gibert Heathcote & Co.—Roof principals and supports, £3,658.

The Committee has also resolved to extend the contract of Messrs. A. Reyrolle & Oo., Ltd., for E.H.T. switchgear at Neepeend, to provide the additional switchgear required in connection with the extensions of plant now in hand, at £5,311, based on the original contract prices; also the contract with the same firm for the supply and delivery of E.H.T. sub-station switchgear to provide for 30 additional panels, at a total cost of £3,604, based on the schedule price in the original contract. The following tenders have been accepted by the Health Committee for supplies of electrical fittings :-

General Electric Co., Ltd.; Tasker, Sons & Co.; I.R., G.P. & Telegraph Works Co., Ltd.; David Ashton & Co.; Thomas A. Ashton, Ltd.; C. Macintosh & Co., Ltd.

Southampton.—The Corporation has extended its present contract for A.C. meters with the British Thomson-Houston Co., Ltd., of Coventry, for another 12 months.

Stretford.—The U.D.C. has accepted the tender of the General Electric Co., at £79, to supply 500 yards of '2 eq. in. cable.

Torquay. — Owing to the difficulties and delays to navigation on the coast, the Town Council has agreed to pay an extra 2a, per ton over the original contract price for any future supplies of coal by Messre. Remwick, Wilton & Co.

Tunbridge Wells.-The T.C. has accepted the tender of Messrs, T. Bates & Sons for the construction of a reservoir for the new cooling tower at the electricity works, at £547.

The T.C. has been recommended to accept the tender of Messra. W. A. Stevens, Ltd., at £5 546, to supply four double-deck and two single-deck petrol-electric buses to the Tramways Department. The tender of Messra. Woodall, Duckham & Co. is further recommended, at £19,845, for the construction of 20 vertical gas retorts with electrically-driven plant.

Watford.—The Electrical Engineer has been authorised to purchase 200 meters from the Electrical Apparatus Co., to be taken when required during a period of two years.

-An offer by the Windsor Electrical Installa-Windsor.—An offer by the Windsor Electrical Installation Co. to install duplicate pumps and motors, to be electrically driven, at the waterworks, for the sum of £1,100, and to take away the existing No. 5 Hayward-Tyler pump, allowing £100 for the same, has been accepted by the Windsor T.C. Each of the new pumps is to be of the Rees Roturbo pattern, with a capacity of 60,000 gallons per hour, to maintain a pressure equivalent to 200 ft. head. The company's estimate also includes the laying of necessary mains to connect with both Slough and Windsor power stations. For his advice and assistance the company's engineer (Mr. Farrow) has been thanked by the Corporation.

Wolverhampton.—The Corporation Tramways Committee has accepted the tender of the United Electric Car Co., Ltd., amounting to £818, for vestibules, staircases, &c., for 18 cars.

#### FORTHCOMING EVENTS.

Institute of Marine Engineers. — Friday, March 12th. At 8 p.m. At Tower Hill, Minories. Abnual Meeting.

Physical Society of London,—Friday, March 12:h. At 8 p.m. At Imperiat College of Science, South Kensington. Papers on "The Estimation of High Temperatures by the Method of Colcur Identity," and "The Unit of Candle-piwer in White Light," by Messrs, C. C. Paterson and B. P. Dudding; and "The Relative Losses in Dielectrics in Equivalent Electric Fields, Steady and Alternating (R.M.S.)," by Mr. G. L. Addenbrooke.

South-Western Polytechnic Institute.—Friday, March 12th. At 8 p.m., At Mauresa Road, Chelsea, S.W. Presentation of Prizes and Certificates.

Greenock Electrical Society.—Saturday, March 13th. Visit Messrs. Mavor and Courson's works, Grasgow.

Thursday, March 18th. At 7.45 p.m. At 21, West Stewart Street.
Paper on "Suction Gas Plant," by Mr. E. P. Duckworth.

Royal Institution of Great Britain.— Saturdays, March 13th and 20th.

At 3 p.m. At Albemarie Street, W. Lectures 1V and V on "Recent Researches on Atoms and Ions," by Sir J. J. Thomson, F.R.S.

Institution of Post Office Electrical Engineers.—Monday, March 15th. At 6 p.m. At Institution of Electrical Engineers, Victoria Embankment, W.C. Paper on "Telephone Economics—Open Construction," by Mr. H. A. Smith.

Institution of Electrical Engineers (Birmingham Local Section).—
Wednesday, March 17th. At 7:30 p.m. At the University, Edmund Street,
Paper on "Electric Cooking, Mainly from the Consumer's Point of View,"
by Mr. W. B. Cooper.

Royal Society of Arts.—Wednesday, March 17th. At 8 p.m. At John Street, Adelphi, W.C. Paper on "The Industrial Uses of Coal Gas," by Mr. H. M. Thornton.

Institution of Mechanical Engineers.—Friday, March 19th. At 8 p m. At Storey's Gate, S.W. General Meeting.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, March 19th. At 7.30 p.m. At Bolbeo Hall, Newcastle-upon-Tyne. General Meeting.

Association of Mining Electrical Engineers (West of Scotland Branch',— Friday, March 19th. At Royal Technical College, Glasgow, Paper on "The Use and Abuse of Oils in Connection with Electrical Plant," by Mr. T. C. Thomsen.

Electro-Harmonic Society.—Friday, March 19th. At Holborn Restaurant, Smoking Concert.

Association of Engineers-in-Charge.—Saturday, March 20th. At 7.30 p.m. At St. Bride's Institute, Bride Lane, E.C.

#### NOTES.

Electro-Harmonic Society.—The last smoking concert Electro-Harmonic Society.—The last smoking concert of the season will be held at the Holborn Restaurant (King's Hall), on Friday, March 19th, at 8 o'clock p.m., Sir John F. C. Snell presiding. The preliminary programme is as follows:—Tenor, Mr. Joseph Cheetham; baritone, Mr. Tom Kinniburgh; elocutionist, Mr. Ernest Meads; humorist, Mr. Fred Curtis; entertainer, Mr. Foden Williams; entertainer at the piano, Mr. Finlay Dunn, and, by desire, a small professional orchestra from the London Symphony Players; conductor, Mr. Charles Woodhouse (the King's Private Band). At the piano, Mr. Bernard Flanders, A.R.A.M.

Another Tramcar Ticket Case.—For refusing to produce a tramcar ticket, W. J. Crockett, of Kingston, was fined £1 and £2 5s. 6d. costs at Kingston, on March 3rd. The Standard says that he did it "for the public" because of the annoyance to which they were subjected, and he declared that he would carry the matter before the High Court.

Charge of Stealing.—At the West London Police Court last week, A. Pamington, electrical engineer, Newcastle Row, Clerkenwell, and T. Bamyard, sales manager, were remanded on bail on a charge of being concerned with Rsoul de Redon (in custody) in stealing and feloniously receiving on February 16th certain X-ray tubes and apparatus, which were described to the Court as the property of the West London and Royal Free Heavitals. Hospitals.

Trade. - THE FEBRUARY FIGURES. -Foreign following are the electrical and machinery figures given in the official returns for February :-

Association: Electric Supply Staffs.—A Committee has been formed of the following chief assistant electrical engineers of undertakings in Greater London, namely:—Messrs. Baron, St. Panoras; Bowden, Hackney; Macalister, Islington; Richardson, Marylebone; Thompson, Battersea; and Young, Stepney, with a view to forming an Association on the lines of the Associated Municipal Electrical Engineers of Greater London. The chief object of the proposed Association will be to endeavour to fill the want which has long existed for an Association which will encourage an interchange of ideas, fortex metal interests and generally execute the terms of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the second control of the foster mutual interests, and generally create a better understanding between the executive staffs of different electric light undertakings. Previous attempts have been made towards the incorporation of the chief assistants in the parent Association, and the formation of an Association of their own, but, unfortunately, without success. Now that a Committee has been formed, however, it is to be hoped that their endeavours will be crowned with success, and that the Association will eventually, hold a position second only to that of the parent body,

Digitized by Google

Hungarian Alaminium Oxide.—It is stated that the Neuhausen Aluminium Industry Co. has concluded a contract with the Bihar Forest Industry and Lime Kiln Co. for the delivery of the Bihar F rest 1 adustry and L me Kiln Co. for the delivery of 50 000 tons of aluminiferous rock (bauxite) per annum as from March 1st. 1915. The latter company, which was originally formed by the L'ége fi m of Lumarche possesses a rope railway, five miles long, which ends in the bauxite district, where arrangements have been made for mining on a large scale. The rope railway joins the Grosswardein-Vaskop local railway, with which the Neuhausen company has also entered into a freight agreement. A certain amount of the production of bauxite is to be treated in Hungary, while the bilance will be exported apprently to the Swiss comwhilt the bilance will be exported, appirently to the Swiss company's new works on the R'ine. This action has partly been suggested by the impossibility of obtaining further supplies of bauxite from France in consequence of the war.

Fatalities.—Sheffield.—According to the Sheffield Telegraph, a boy named Walter Carley, aged 15 years, while putting

and a solution on the premises of a relative, a pork butcher at Attercliffe, on 5:h inst., received a shock which proved fatal.

Pontymister.—An inquest was held on March 4th as to the cause of death of Joseph Grinnell (32), at Pontymister Works.

The evidence showed that while Grinnell and another (G. E. Buck) were in a 10 ft. excavation, Buck in regulating a suction pipe received an electric shock and was thrown on his back. His feet came in contact with the pipe and he was held by the current. He called for help, and Grinnell came to his assistance. A witness found the two men, and received a slight shock in pulling Grinnell away, but the latter was quite stiff and did not speak again. Witness said he did not realise the risk that he was running by catching hold of the decessed with bare hands. Artificial respiravatching hold of the deceased with bare hands. Artificial respira-tion was tried for 25 minutes. The foreman, as reported in the South Wales Daily News, said that the accident was due to the pipe becoming electrically charged, and Benjamin Thomas, who connected the motor, said it would have been impossible to insulate the pipe, but, a rubber pipe wint have been impossible down. The the pipe, but a rubber pipe might have been put down. The verdict was to the effect that deceased was accidentally killed by a discharge of electricity whilst going to the help of another workman.

ABERTRIDWS.—A Cardiff paper reports that an 8-year old boy, named Preece, climbed on the roof of a power station, caught hold of the electric wires, and was killed.

Feeder Reactances. - Feeder reactors are now being in-Proceed in the generating station of the United Electric Light and Power C., N. w York City. Only two reactors are being employed in each three-phase circuit. The units, which have 34 per cent. reactance, are porcelain-clad and mounted vertically in pairs to economise in space. The current rating of the feeder cables is 300 amperes. Besides these reactors there are also 18 per cent. units connected between the 'ous sections, which are designed to carry 2,000 amperes. Further resistance to surges is offered by each generator's inherent reactance, which is about 75 to 8 per cent. The rated full-load current for each generator is 1,387 amps. per phase.—Electrical World.

Liquidation.—British Prometheus Co, Ltd., Birmingham.—A meeting of creditors is called for March 25th, at 12 o'clock noon, at 26, Corporation Street, Birmingham.

New Electric Clock at Birmingham Post Office.—
The G.P.O. are adopting electric turret clocks, when public clocks are required in their buildings, on account of the advantages they offer as regards uniform time-keeping, and the saving on maintenance. Messrs. Gent & Co., Ltd., of Leicester and London, have supplied the first of these clocks purchased by the G.P.O., which has now been erected at the G.P.O., Birmingham. The type selected by the Post Office Engineers is that known as the "Waiting-Train," which is a speciality of the firm mentioned. The new clock is fixed on the bridge which connects the new portions of the G.P.O. buildings to the old. The dial is 5 ft. in diameter, and is provided with 12 distinguishing marks in lieu of the ordinary Roman numerals, as advocated by the late Lord Grimthorpe. It is arranged for internal illumination, which is provided by electric lamps within a reflector which is disposed behind the dial and is the full diameter of the latter.

The small amount of current required for operating the New Electric Clock at Birmingham Post Office.-

The small amount of current required for operating the "Waiting-Train" movement is taken from the accumulator in the building, which has been installed for general purposes. The m chanism is under the constant control of a master clock, the control being effected by the half-minute impulses, in a simple manner, which dispenses with contacts or additional batteries.

manner, which dispenses with contacts or additional batteries.

The hands of the clock are exposed directly in the open, and therefore a clear reading of the dial is obtained under all conditions, the absence of a covering glass eliminating sun glare and reflection which at some part of the day might prevent the reading of the time. The great power of the "Waising-Train" movement renders a covering glass unnecessary, the power developed by this mechanism being in direct proportion to the load put upon it, so that the hands cannot be stopped by snow or the mist severe gales. Many public clocks were stopped, or others were affected, by the heavy gale that swept over the metropolis a few weeks ago, even Big Ben being half an hour slow.

The largest electric clock in the world, on the Rival Liver

Tae largest electric clock in the world, on the Royal Liver Building at Liverpool, which is driven by the "Waiting-Train" movement, has kept time with unfailing accuracy since it was first started on Coronation Day, 1911. The heaviest gales of wind and snow have never affected its time-keeping qualities, despite the great length and weight of the hands required by dials considerably larger than that of London's largest clock, Big Ben Copper,—The diminution in visible supplies during February, 1915, as shown by Mesers. H. B. Marton's statistical circular, was 750 tons, and in English supplies 775 tons. European arrivals from North America amounted to 16,614 tons, alightly less than during December last. Spain and Portugal supplied England and France with 2,381 tons, a quantity seldom corolled ingrease through considerable above the 1913 equalled in peace times, and considerably above the 1913 average. A heavy supply was also drawn from countries not individually classified, equal to a fairly good month before the war. Chile shipments were below average, and Australian, though above the quantity for the four preceding months, was not up to average. Total deliveries, at 28,861 tons, exceed those for August, October, or November last by a considerable amount.

Institution and Lecture Notes.—Institution of Electrical Engineers.—The following are the Council's nomina-tions for the vacancies which will occur on the Committee of the tions for the vacancies which will occur on the Committee of the WESTERN LOCAL SECTION:—Chairman, Mr. D. E. Roberts, Cardiff; Vice-Chairman, Prof. D. Robertson, Bristol. Eight nominations to fill five places on the Committee: Mesvre. A. J. Abraham, Aberdare; M. T. Evans, Bristol; R. H. Fletcher, Llanishen; W. W. Hughes, Swansea; A. C. McWhirter, Cardiff; W. G. Heatb. P. ymouth; C. W. Salt, Torquay; A. L. Stephens, Bristol. At the monthly meeting of the Scottish Local Section, held at Edinburgh on Thesday last, the paper on "Automatic Protective Switchgear for Alternating-Current Systems" was read by Mr. E. B. Wedmore.

E. B. Wedmore.

The STUDENTS' SECTION discussed the "Applications of Electrical Engineering to Warfare," on March 3rd. Section (a) "Communications," was opened by Mr. P. R. Coursey, who said that fire and flashlight signalling had long ceased to be utilised as a means of official communication, and the applications of electrical engineering had enabled great strides to be made towards the ideals of speed and secrecy. It the present war electrical means of communication were being employed to an enormous extent by all the nations involved, five main types of electrical apparatus being used, as follows:—Wireless telegraph, Wheatstone automatic telegraph, Morse sounder, vibrator telegraph and field telephone, the telegraph, Morse sounder, vibrator telegraph and field telephone, the last two being generally combined in one apparatus. Mr. Coursey gave brief descriptions and illustrations of the most general types of military apparatus. Mr. Smith-R se referred to the difficulties of reception of wireless messages on aeroplanes on account of the noise of the engine. Mr. Emtage suggested that it might be posnoise of the engine. Mr. Emtage suggested that it might be possible to detect the approach of Z ppelins and submarines by picking up their ignition sparks by wireless receivers; and also described the pneumatic headpiece "shock absorbers" worn by airmen, which at the same time served to deaden the noises due to the engine, and facilitated wireless reception.

The chairman (Mr. Duddall) and that the great chimbion to

the engine, and facilitated wireless reception.

The chairman (Mr. Duddel) said that the great objection to molern methods of communication was that they all gave too much information to the enemy, and in many cases dispatch-riders were proving to be a more secret means of communicating intelligence. Section (b), "The Firing of Mines and Explosives," was opened by Mr. S. Killingback, who said that the advantages of electrical means for firing mines might be briefly summarised as convenience, greater reliability, remote control, simultaneous firing of several charges. Mines and explosives might be fired either by accumulators or by the portable hand-operated service dynamo. The standard types of electric fuses and detonators required a current of about 0.8 ampere for fusing. Mr. Heslop said that the chief field for electrical firing of mines was for harbour protection, current of about 0.8 ampere for fusing. Mr. Heslop said that the chief field for electrical firing of mines was for harbour protection, as reliable connections and cables could then be laid. The ordinary time-fuses were generally satisfactory in other cases. Section (c), "Searchlights and Projectore," to be opened by Mr. E. L. M. Emtage, was adjourned to March 31st next.

At the meeting of the YORKSHIRE LOCAL SECTION on Wednesday last, a paper was read by Mr. W. B. Cooper, on "Electric Cooking: Mainly from the Consumers' Point of View." The same paper was to be read last night in London.

t) be read last night in London,

National Association of Colliery Managers.—In a paper on "The Electric Safety Lamp in Mines," read to the Association in Edinburgh, on Saturday, Mr. John George, Cambuslang, pointed out that it had to be admitted that the first cost of films lamps was lower than that of electric lamps, but first cost was not everything; with the reduced light furnished by films safety lamps it was nearly impossible to keep coal clean, and, in many instances, managers had to pay for dirt when they ought to be getting coal. Then owing to the same cause they were always liable to have falls of roof and sides. There was no doubt that the number of electric lamps in daily use in the mines was increasing by thousands every year, one firm alone having 75,000 lamps in daily use in the pits.

Edison and Benzol.-Mr. T. A. Edison is said to have turned his attention to the problem of recovering benz il from coke-making plants; it is reported that he is engaged on the construction of a plant for that purpose in accordance with his own designs, at J hastown, Pennsylvania, adjoining the by-product coke ovens of the Cambria Steel Co.

Russian Trade.—Apropos of the references to this subject in our leading columns to-day, we are in touch with a French engineer of considerable experience, who speaks and writes Russian fluently, and has business relations with Russia; his services are at the disposal of any reader who is desirous of establishing trade with that country.

Educational.—A well-equipped laboratory for electrotechnical work was recently opened at the Madras College of Engineering, which can now provide courses of instruction up to the highest standard deman'ed for engineering work in I idia.

Appointments Vacant.—Engine driver and switchboard attendant (30s.) for R yal Hilloway College, Eiglefield Green, Surrey; junior shift engineer (25s.), for Heywood Electricity Works; fixter (36:), for R yal Hilloway College, Eiglefield Green, Surrey; a cable engineer is wanted by a company which intends erecting works for the manufacture of vulcanised rubber cables. See our advertisement pages to-day.

Electric Vehicle Charging Stations. - We learn that the General Electric Co., Ltd., have been appointed official manufacturers to the Electric Vehicle Committee of the standard design of illuminated box sign for charging stations and for garages where charging facilities are provided. The sign, wir d complete, with terminal box, and arranged for bolting to the face complete, with terminal box, and arranged for bolting to the face of a wall, or supporting from the usual type of bracket, is made in four standard sizes. The two standard sizes, 30 in. square and 18 in. square, each size with either a single or double face, are those recommended by the Electrical Vehicle Committee. This sign is also the subject of a leafit, No. F. 1.887. The frame and case are of stove-enamelled iron, black outside and white inside, and the panels are of duplex glazing, formed of a front sheet fired with red and white permanent colours, backed by a sheet of clear glass. The advantages of this method of glazing are:—Bright colours which show well both by day and night; strength; and smooth surfaces on both sides of the panel, which keep clean longer and are easily cleaned. are easily cleaned.

Action Against the Marconi Co.-For some days past Mr. Justice Avory and a special jury have been occupied with the hearing of the case of J. W. Hamilton r. Marconis' Wireless Telegraph Co., Ltd. The plaintiff, who acted as defendant's sole agent in Australia and secured a number of important contracts there, claims damages for wrongful termination of his engagement. The company has a counterclaim for damages. The hearing stands

Patents and Alien Enemies.—Application has been made to the Board of Trade by the Manchester Armature Repair Co. to avoid or suspend the following patents:—10,457/16, granted to Hopfelt; 2,711/10, 20.634/10 and 9,941/11, granted to the Specialfabrik für Aluminium-Spulen und Leitungen G.w.b.H.; and 27,651/12 granted to Leewenthal. The hearings are fixed for March 23rd.

For Sale.—Salford Corporation invites tenders, by March 22nd, for the purchase of storage battery, booster, two balancers and electric motors. Particulars are given in our advertisement pages to-day.

Black Smoke Offences: Electrical Cable Manufacturers and War Orders.—Two electrical cable manufacturers having works in Manchester were amought a number of defendant firms summoned at the Manches'er Police Court on Wednesday for permitting emissions of black smoke from their works' chimneys. A representative of one of the firms suggested that the local Sanitary Committee (who authorise these prosecutions) should allow more latitude under the present exceptional circumstances. They were busy on army contracts, and their difficulties were added to by the fact that they had been, owing to enlistments amongst the men, compelled to find fresh firemen. They had had five firemen in one month, and the man they had now

was not satisfactory.

A similar representation was made in the second case, but fines and costs were, nevertheless, imposed in each case.

Pocket Torches.—According to a note in the Evening News, a British-made battery, as good as the German article but at a lower price, called the "Diehard," is now available for nocket torches. This battery, we may add, is made by Mes rs. Signum Ltd., of 46, Kingaway, W.C.

#### OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—Under a scheme for the re-arrangement of the staff of the Walsall electric supply department, the following and other alterations are proposed:—Management staff—(1) C. W. COOKSON, now chief clerk and collector, to be

accountant and collector at his present salary; (2) D. Mills, second clerk (now £104 per annum), to be appointed chief clerk, at £136 per annum, increasing by £10 annually to £150 per annum. Distribution staff—(1) a meter tester and installation inspector to Distribution staff—(1) a meter tester and installation inspector to be appointed at £2 2s. per week, rising to £2 10°. per week; (2) E. EYNON, senior sub-station attendant, to be temporarily substation foreman, at £1 17°s. 61°, rising to £2 2s.; (3) new substation attendant to be appointed at (orobably) 30°s. per week; (4) the wages of sub-station attendants, G. ALRIDGE and J. STOKES, to be advanced by 2s. 6d. per week each. Sales department staff—(1) the canvasser (ME. H. HOPKINSON) to be sales engineer and canvasser, at £2 7°s. 6d. per week, an increase of 5°s. 6°l. per week. The question of appointing a separate canvasser has been deferred for three months. The immediate annual increase in salaries and wages under the proposed re-organisation is £438, a large proportion whereof is in respect of new work which will be self-supporting. supporting.

MR. J. ELLIS and MR. V. A. WOODLAND have resigned their MR. J. ELLIS and MR. V. A. WOODLAND have resigned their appointments as shift engineer and meter inspector, respectively, at the Watford electricity works. Increases in the salaries of the undermentioned employés at the electricity works, are to be made as follows:—J. E. WALLEY, mains engineer, £145 to £170 per annum; W. MIDDLETON, shift engineer, £90 to £100 per annum; rising by annual increments of £5 to £110; E. E. POPE, shift engineer, ditto; F. H. JOHNSTONE, meter inspector, 30s. to 35s. per week. The Electricity Committee has been given authority to select candidates and make appointments in all vacancies coming under its notice up to and including £100 per annum.

MR. J. H. PARKER on leaving the Green ock electricity works.

MR. J. H. PARKER, on leaving the Green ock electricity works to take up his position at C ovdon, was presented by the staff and employes with an electric floor standard and shade. Mr. F. H. Whysall, chief engineer, made the presentation.

MB. C. CRANDON has resigned his appointment as switchboard attendant at the Tunbridge Wells electricity works in order to take up an appointment at the Chel ea electricity works.

Woolwich T.C. on March 3rd increased the salary of MR. S. H. PENNING, deputy electrical engineer, by two equal instalments of £15, to a maximum of £250 a year; and that of MB. C. Hobson, charge engineer. from £130 to £140.

Lineaster T.C. has appointed Ms. J. B. Patterson, works superintendent at the electricity works, as assistant engineer, he to be paid £3 3s, per week whilst the electrical engineer is absent on military service.

Rotherham T.C. has appointed Ms. J. R. LILLEKER, who has been on the staff for 14 years, as assistant electrical engineer, at a salary of £200 a year. He succeeds Mr. J. Williams, who is now electrical engineer and tramway manager at Erith.

Maidenhead T.C. has appointed, out of over 150 applicants, MR. WILLIAM EDWARD CLARET, of South Tottenham, as station superintendent at the electricity works, at £175 per annum.

MR. H. E. WRIGHT, of the Dover Corporation electricity staff, has resigned, and his successor is Mr. Byles, an old student at the works.

Mr. H. Partington, who was appointed to the sub-station superintendent vacancy at S ifford, has now decided to remain with the Scottish Central Electric Power Co., Falkirk.

Tramway Officials.—The Plymouth Tramways Com mittee has recommended the appointment of Mr. C. R. EVERSON a tramways manager, at a salary of £500 a year and house, for three years from Novembur 9th, 1914, with an option to extend the term for a further period of a year, the compensation to which Mr. Everson is entitled to be suspended whilst he holds the office.

The Darlington T.C. has appointed Mr. Fraser, of Kilmarnock, as tramway traffic manager.

General.—The foremen of Messrs. Howard & Bullough, presented Mr. G. W. Somerville with a smoking cabinet suitably inscribed, and a gold mounted walking stick, as a token of esteem, on his resignation of the position of chief electrical engineer at Globe Works last week. The presentation was made by Mr. James Arrowsmith, the oldest foreman. Mr. Semerville had previously been presented with a suit case and military hairbrush by the men employed in the firm's electrical department. He is now interested in the Unity Wood and Iron Co. Padiham, and is also in wratice as a convention and Iron Co., Padiham, and is also in practice as a consulting

and inspecting engineer.

We are informed that Mr. B. T. Durran, an English director of the Allgemeine Elektrici'a's Gesellschaft, Berlin, and its English and foreign sub-idiary companies, who was responsible for the organisation and management of the A.E.G 's large foreign business, returned to this country from Germany some months ago. We understand that Mr. Durran's departure from Germany was made possible by the a scistance of Dr. R thenau and Mr. Deutsch,

made possible by the assistance of Dr. Rethense and Mr. Doutsen, the heads of the A.E.G.
MR. V. T. TAYLOR, who, we understand, is well known in South African electrical circles, has recently returned from the St. John Del R.y Gold Mines, Brazil, and has taken up a position with Sir W. Armstrong, Whitworth & Co., Elewick Works, for the duration of the ware of the war.

of the war.

MR. A. P. TROTTER'S official address is 8, Richmond Terrace.

Whitehall, London, S.W., and not the one printed by accident in
the List of Members of the Institution of Electrical Engineers.

MR. REGINALD P. WILSON is now on his way back to London,
after an extended visit to South America.

MR. GEORGE BALFOUR has joined the board of the Cordoba
Light, Power and Traction Co., Ltd.

Obituary.—Mr A. L. E. Drummond.—The death occurred in Newcastle-on-Tyne on 5th inst. of Mr. Alfred L. E. Drmmond, manager of the Post Office telephones in the city, and formerly manager for the Newcastle District for the National Telephone Co., who was a past president of the Nawcastle local section of the Institution of Electrical Engineers. Mr. Drummond was born at Scarborough in 1860. He served his apprenticeship with Messrs Crooks Roberts & Co., engineers, of Sheffield, and then went to London. In 1881 he returned to Sheffield as secretary and assistant-manager to the Telephone Exchange and Electric Lighting Co. Five years later he joined the National Telephone Co. as district manager in the Potteries. Later Mr. Drummond was transferred to Leeds, afterwards to Manchester, then to Oldham, and four years later to Plymouth. In 1902 he was appointed manager of the Newcastle district, and on the purchase of the National Company's system by the Government he continued in that position.

ME. H. GABBUTT.—We regret to hear of the death of Mr. Harry Garbutt, representative for many years of Mesers. I. Frankenburg & Sons, L'd., cable makers, Salford, Manchester.

# OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Robert W. Blackwell & Co., Ltd. (63,446).—Capital, £250,000 in £1 shares. Return dated January 14th, 1915. All shares taken up. £1 per share called up on 75,007 and 10s. per share on 25,000; £87,507 paid, £149,992 considered as paid on 149,993 shares. Mortgages and charges: Nil.

Adelaide Electric Supply Co., Ltd. (84,209).—Capital, £300,000 in 50,000 pref. and 50,000 ord. shares of £5 each. Return dated January 5th, 1915. 43,805 pref. and 50,000 ord. shares taken up. £5 per share called up on 43,805 pref. and 24,000 ord.; £339,025 paid. £130,000 considered as paid, 26,000 ord. Mortgages and charges: £219,572 five per cent. debenture stock. (A further 959 pref. shares were allotted, payable in cash, to February 3rd, 1915).

Burmah Electric Tramways and Lighting Co., Ltd. (75.070).—Capital, £200,000 in 20,000 ord. and 20,000 pref. shares of £5 each. Return dated December 31st, 1914. All shares taken up. £100,000 paid on the pref., £100,000 considered as paid on the ord. Mortgages and charges: Nil.

E. S. Co., Ltd. (139,230).—Particulars of £20,000 debentures, created February 11th, 1915, filed pursuant to Section 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued, Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

Creed Bille & Co., Ltd.—Two mortgages, one as collateral security, both dated February 4th, 1915, to secure £1.500, charged on land in Cherry Orchard Road, Croydon, with buildings thereon, formerly known as the Croydon Skating Rink, and benefit of building agreement relating to certain lands in Cherry Orchard Road, Addiscombe Road, Colson Road, and Cedar Road, Croydon.

Note: The Collaboration of the Croydon Road, Croydon.

National Telewriter Co., Ltd.—Particulars of £15,000 debentures, created February 26th, 1915, filed pursuant to Section 93 (3) of the Companies' (Consolidation) Act, 1908, the amount of the present issue being £2.000. Property charged: The company's undertaking and property, present and future. No trustees.

#### CITY NOTES.

## The Mackay Companies.

The accounts for the year ending February 1st last show about the same figures as were issued last year, with the exception of operating expenses, which show an increase of \$29,997, a trifle when compared with capital liabilities of \$91,380,400. The income from investments in other companies is more this year by \$43,601, while the cash assets are up by \$117,964. We have on previous occasions remarked on the meagre nature of the accounts, which do not give a proper conception of the financial state of the Trust. To mention one instance again, it is not stated if the investments in other companies are "at cost" or "market value," and until this is stated uncertainty must exist. Nothing has apparently been carried to reserve, and in this connection it may be mentioned that last year it was stated that "reserves have been increased not so largely as in previous years, but substantially." This, taken in conjunction with the remark that the trustees have been compelled to insist on the most rigid economies in operating expenses, is not very encouraging. Notwithstanding the tendency towards lower rates, the trustees are prepared to lay a cable to compete with the Western Union in Mexico, and so cut rates still further, and the "Cuban" rate war is quite fresh in our memories. When talking about increasing rates the trustees are treading on very delicate ground, and it remains to be seen how far success will attend efforts in this direction, particularly in vew of the extension of cheap rate services by other Atlantic telegraph companies. Is the capacity of the Atlantic cables being used to the full? The volume of traffic available is enormous, and it is a question how far the policy of refusing to take night and week-end letters adversely affects the commercial lines. Of course, due allowance must be made for the existing disturbed trade conditions, which, it is hoped, will soon terminate and lead to the usual brisk business.

## Neuhausen Aluminium Industry Co.

The report for 1914 of the Aluminium Industrie A.G., or Neuhausen, states that favourable results were obtained, but nothing is mentioned as to the situation of the market or the influence of the war on this particular trade. The financial figures, permitting of the payment of a dividend of 20 per cent. on old share capital, as in 1913, and of 10 per cent. on new share capital, were reproduced in this journal two or three weeks ago. It appears that while the works at Neuhausen and Rheinfelden experienced no capital changes as contrasted with 1913, and those at Lend-Rauris underwent a slight diminution in consequence of the sale of a site, an increase of £124,000 took place in connection with the Vallais works, which was chiefly incurred in the Borgne water-power plant and the extension of the Rhone works. It will be possible to bring the Borgne plant in operation as soon as required. The extension of the works at Marseilles and the participation in bauxite mines have raised the capital expenditure on these from £287,000 to £485,000, but a reduction has occurred in the Goldschmieden-Trotha auxiliary company. The Neuhausen company has taken up as a new interest £68,000 in the Martius Works of Bergheim, near Cologne, which is to produce bauxite.

## Hastings and District Electric Tramways Co., Ltd. .

During 1914 there was a decrease in the traffic receipts of £3,141, entirely attributable to the war. The expenditure shows a decrease of £4.101, which is in excess of the falling off in the receipts. The revenue after crediting receipts from the statutory company, £19,349, and transfer fees £7, and debiting administration expenses £1,338, shows a balance of £18,018, plus £1,037 brought forward. Deducting £10,633 for interest charges, there remains available £8,421. Owing to the uncertain financial outlook in October last, the directors thought it best to hold back the interim dividend on the preference shares, but they now propose to pay a final and complete dividend of 6 per cent. for the year, absorbing £4,800; £1,000 is to be transferred to depreciation account, to write £1,500 off suspense account, and to carry forward £1,121. The installation of the Tilling-Stevens petrol-electric system on the front line has been carried out. The 17 cars required for the purpose were duly converted, and the last of their were placed in operation during the month of July, since when the system has worked satisfactorily.

Mr. Geo. Kitchin, who presided at the annual meeting held on Tuesday at the offices, I, Queen Victoria Street, E.C., referred first to the general disturbance that had resulted from the war. This company's receipts had fallen, since the war began, by about 30 per cent. Fortunately, it had been possible to curtail the expenses; but had they gone on as they were doing up to the end of July they would have had an increase in receipts as well as a reduction in their working expenses. Up to the outbreak of the war they had an increase of £570 on their traffics, whilst the reduction of working expenses had been continuous throughout the year. The traffic receipts of the Hastings company amounted to £50,204, plus £632 for advertising, etc. On the expenditure side, a decrease was shown in each item, the total saving being £4,101. Over £3,000 of this sum was a saving on maintenance and repairs. These had now been reduced to a normal figure, the short-comings of previous years having been made good. The total amount expended was £31,488. Bringing down the balance. £19,349, to the Hastings and District revenue account, and deducting their usual London expenses, together with debenture interest, and interest paid to bankers, and adding £1,037 brought forward, they had £8,421. It was proposed to carry £1,000 to depreciation account, which would then stand at £26,000, and to write £1,300 off the suspense account, which stood on the credit side of the balance sheet and represented legal and other expenses incurred in the installation of the petrol-electric system. These cars were working in a satisfactory manner. At first there were some difficulties with the lighting and the tanks for the petrol which were placed in the cars; but these difficulties had now been overcone; the 17 cars had been at work for several months, and they heard of no complaints from the public. The loan from the bankers of £5,500 had been reduced to £4,000. Following the promise made to them last year, they had carried the whole of the cost of their pe

they decided to hold back the preference dividend until the end of their financial year, when the final figures would enable them to see more clearly what the position was. That day they were hoping to pass a resolution authorising the payment of that dividend, though it was not proposed to send out the cheques for it until the end of the present month. At the same time, he wished to warn them that it was possible that the preference dividend might not be earned during the that the preference dividend might not be earned during the current year, as the figures for 1915—comparing with those of 1914—would probably for the first six months show a considerable shrinkage. They would possibly be desirous of knowing how they were situated with regard to the local authorities and he worked that he was retired to the local support of the state of the local support of the state of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of the local support of th authorities, and he regretted that he was not in a position to give them any satisfactory intelligence on this point. The wish of the board was, and always had been, to work amicably give them any satisfactory intelligence on this point. The wish of the board was, and always had been, to work amicably with the Corporation, but for some reason or other it would appear that the committee which controlled these affairs was not able to see eye to eye with the directors on any point, and was continually throwing obstacles in the way of their improving the services. Still, they could only hope that this state of things would not continue indefinitely. The Chairman referred to the death of the late general manager, Mr. Holliday, and said that as his successor they were fortunate in having to hand Mr. Edwards, who had been managing the company's affairs during Mr. Holliday's illness. They therefore appointed him general manager, and the result they saw that day was the effect of the appointment. The efficiency of the company had not suffered by the change, and the work in Hastings was well and effectively supervised.

Mr. J. C. Williamson seconded the motion.

Mr. Webb asked if the board anticipated much reduction in expense from the adoption of the petrol-electric form of traction on the front at Hastings.

The Chairman said that last year he stated there would be an increase of expense by the introduction of the petrol-electric system, and he had no reason to alter that opinion that day. The cost of petrol would be to a considerable extent added cost, and there would also be the cost of the maintenance, which was a considerable item on the cars which were fitted for that nurrose.

ance, which was a considerable item on the cars which were fitted for that purpose.

Newcastle and District Electric Lighting Co., Ltd. The annual meeting was held on 5th inst. in Newcastle-on-Tyne, Sir Benjamin C. Browne, who presided in the absence of Dr. J. B. Simpson, first referred in some detail to the capital account. Dealing later with the profit and loss account, he said that the item £11,388 for wages, salaries, and rates, &c., showed an increase of £1,023, largely accounted for by an increase of £760 for rates due to a new excessment of the company's works and mains. The of £1,023, largely accounted for by an increase of £760 for rates due to a new assessment of the company's works and mains. The total gross receipts for electrical energy showed an increase of £7,514 over 1913. These receipts had been adversely affected due to the earlier closing of licensed premises and the reduction of lighting in shop fronts, &c., but this had been compensated for by the increased demand for power purposes. The gross profits for the year were £32,030, being an increase of £1,206, and the amount available for distribution was £21,293. The arrangement with Massers Spencer & Sons of Newburn to utilize the made with Messrs. Spencer & Sons, of Newburn, to utilise the whole of their exhaust steam had now come into force, and the directors felt confident that this would be the means of a great saving in the working costs. The dividend at the rate of 3 per cent. was approved.

Chelsea Electricity Supply Co., Ltd.—The profit for 1914 was £37,810, plus £2,766 brought forward and £2,201 for interest, making a total of £42,777. After deducting interest on debenture stock, £7,875, interim dividend on the preference shares at the rate of 6 per cent. per annum, £900, and interim dividend on the ordinary shares at the rate of 4 per cent. per annum, £4,944, £29,058 remained. It is intended to appropriate this as follows:—To credit of reserve for renewals, depreciation and contingencies, £1,420; debenture stock premium redemption fund, £704; written off cost of extinction of founders' shares, £1,089; written off cost of extinction of founders' shares, £1,089; written off cost of investments, £1,429; final dividend on the preference shares, making 6 per cent. for the year, £900; final dividend on ordinary shares at the rate of 6 per cent. per annum, making 5 per cent. for the year, £7,415, leaving to be carried forward £3 101. The number of 8-C.P. lamp equivalents connected on December 31st, 1914, was 314,276, an addition of 7.854 during the year, and the total number of units sold was 4,342,182 being 108,983 less than for the previous year. The annual meeting was held yesterday.

Newmarket Electric Light Co., Ltd.—During 1914 the equivalent of 1,015 33-watt lamps were connected to the mains, making the total connected 30,744 lamps. The profit on the year's working, plus £146 brought forward, amounts to £2,464, which, after providing for debenture and other interest, £733, leaves £1,731. The directors recommend a dividend of 3½ per cent., that £650 be carried to reserve for renewal of plant, and that £151 be carried forward.

Direct Spanish Telegraph Co., Ltd.—The dividend at the rate of 10 per cent. per annum on the preference shares, less income-tax, and one at the rate of 4 per cent. per annum on the ordinary shares, free of income-tax, are recommended for the half-year ended December 31st, 1914. It addition a bonus on the ordinary shares of 2 per cent. for the year 1914, free of incometax, is to be paid.

British L. M. Ericsson Manufacturing Co., Ltd.-For 1914 the directors report that, notwithstand ng the abnormal conditions of trade, the company's business continues to show a most satisfactory result. £25,000 appearing in the balance-sheet as on deposit with Aktiebolaget Stockholms Handelsbank was withdrawn deposit with Aktiebolaget Stockholms Handelsbank was withdrawn on January 1st, 1915, and a corresponding amount of war loan has since been purchased. The net profit, after charging £10,906 for depreciation and £2,500 for debenture interest, amounts to £20,615, plus £6,409 brought forward, making an available balance of £27,023. After paying the preference dividend, amounting to £5,999, a dividend of 8 per cent. per annum is to be paid on the ordinary shares, requiring £8,001, placing to reserve account £6,000, and carrying forward £7,023. Annual meeting, March 17th.

Hadfields, Ltd.—In reporting upon the position of the company at December 31st, 1914, the directors propose to add £26,000 to the reserve and renewal account and carry forward £60,270. They recommend that in addition to the interin dividend of 1s. per share paid in August last, a further dividend be paid on the ordinary shares of 2s. per share, together with a bonus of 1s. 6d. per share, all free of income-tax. Mr. J. P. Crosbie, works manager, and Mr. W. B. Pickering, commercial manager, have been elected directors.

Ramsgate and District Electric Supply Co., Ltd. —Including £1,034 brought forward, the gross profits for 1914 amount to £5,070, and after allowing for interest at the rate of amount to 20,070, and arrer allowing for interest at the rate of 5 per cent. per annum on outstanding accounts due to the contractors, and writing off the cost of creating debenture stock, there is a balance of £3,724. The directors recommend the payment of a dividend of 5 per cent., and that £1,200 be placed to the reserve account, leaving £1,524 to be carried forward.

Canadian General Electric Co., Ltd.—A quarterly dividend of 1½ per cent. for the three months to March 31st, being at the rate of 7 per cent. per annum, on the common stock, and a half-yearly dividend of 3½ per cent. for the six months to March 31st, being at the rate of 7 per cent. per annum on the preference stock, are aunounced.

Hydro-Electric Power and Metallurgical Co., Ltd. The Financial Times says that a meeting of the holders of the debentures is being held to-day to approve resolutions accepting allotment by the Government of Tasmania of £137,750 4½ per cent. Tasmania inscribed stock, to be paid forthwith, and to distribute the stock among the debenture-holders in exchange for the debentures held by them at the rate of £95 of the stock for each £100 debenture, and £19 for each £20 debenture.

Alley & MacLellan, Ltd.—The Times states that the profits for 1914, including £1,741 brought forward, amounts to £25,273. The directors have allocated £9 113 to depreciation and £10,000 to reserve, and recommend that the dividend on the preference shares for the year be paid, leaving £1,908 to be carried forward. Last year a dividend of 6 per cent. was paid on the ordinary shares. ordinary shares

Calcutta Electric Supply Corporation, Ltd.—The number of units sold to consumers during the five weeks ended January 29th, 1915, amounted to 1,254,082, compared with 1,387,896 in the corresponding five weeks of 1914. The reason for the decrease is general slackness of business in Calcutta owing to

Stewarts & Lloyds, Ltd. — After setting aside \$100,000 for depreciation, dividends of 10 per cent. per annum on the preferred ordinary shares, and 2s. each on the deferred shares (making 2s. 6d. per share for the year), are recommended, placing £50,000 to reserve fund, and carrying forward £97,000.

British Westinghouse Electric and Manufacturing Co., Ltd.—The directors have decided to pay a dividend on the preference shares for the year ended December 31st, 1914, at the rate of 71 per cent.

Automatic Telephone Manufacturing Co., Ltd. The profit for 1914 amounts to £35,797, against £22,941 for 1913. After payment of preference dividend and writing off £10,960, as against £8,093, a dividend of 3 per cent. for the year on the ordinary shares is declared, carrying forward £5,256 against £3,218. The transfer-books will be closed from 12th to 20th instants.

International Light & Power Co., Ltd.—A dividend of 13 per cent, less British income-tax, on the preference shares is announced for the quarter ending March 31st.

Globe Telegraph and Trust Co., Ltd.—Interim dividend, 2s. per share, free of income-tax, on the ordinary shares for the past quarter.

Altrincham Electric Supply Co., Ltd.—A dividend of 10s, per share on the deferred shares, subject to tax, is recommended.

Brompton and Kensington Electricity Supply Co., Ltd.—After appropriating to depreciation and sundry reserve accounts sums amounting to £12,121, the directors recommend a final dividend on the ordinary shares at the rate of 11 per cent. per annum, making 10 per cent. for the year, carrying forward £5,625. For 1913 the dividend was at the same rate.

#### City of London Electric Lighting Co., Ltd.

Capital expenditure during 1914 upon additions, extensions and replacements amounted to £61,939, making the total £2.622,813. There was written off prior to De ember, 1913, £566,984, and a further £21,210 has been written off in respect of buildings, plant and other works dismantled during the year 1914, so that the net expenditure at December last was £2.034,619, showing an increase of £40,729 for the year. The balances at credit of the reserve funds stand as follows:

—Reserve account No. VI. £175,885, first debenture stock premium redemption account No. VII. £66,019, leasehold redemption account No. VIII. £5,088, reserve for doubtful debts £1,808, plus the amount proposed to be carried forward to 1915 £23,372, making the total £272,173. The annual profit has naturally been prejudiced by the enforced reduction of lighting and by the increased cost of coal and of all other items of production. The total revenue for the year. £303,543, including interest on investments and discounts £2,541, was £306,084. Expenses of generation and distribution were £72,065, repairs and maintenance of buildings, machinery, plant, mains and other works £11,076, rent. rates, taxes, management expenses and special charges £58,478, leaving £164,465, plus £27,837 brought forward, making a total available revenue of £192,301. Of this sum the following amounts have been distributed or provided for:—Interest on loan from bankers, consumers' deposits, etc., £3,292, interest on first and second debenture stock premium redemption account £1,547, leasehold redemption account, interest and appropriation £288, contributions to employés' provident funds and under National to depenture stock premium redemption account £1,547, lease-hold redemption account, interest and appropriation £288, contributions to employes' provident funds and under National Insurance Act £1,958, stores written down £138, transfer to reserve account £50,000, leaving available £104,160. After paying 6 per cent, on the preference shares for 1914, and a total dividend of 9 per cent, for the year on the ordinary shares, as compared with 10 per cent, for 1913, £23,372 is to be carried forward.

The following tables show the position at the cod of 1914.

The total units sold show an increase of 69,547 over 1913. Power and heating supplies continue to show a steady increase, the total units sold for these purposes in 1914 being as follows:—Power, 11,500,946 units; heating, 2,193,827 units; = 13,694,773 units, equal to 48.6 per cent. of the total units sold for private supply. The directors mention the withdrawal of the County Council's 1914 Bill and the two London Power Bills of the present Session.

Annual meeting, March 16th.

#### County of London Electric Supply Co., Ltd.

THE directors report that the capital expenditure during 1914 in the London districts was £145.851, making the net total in respect of those districts £2.098.549. The balance from revenue respect of those districts £2.098.549. The balance from revenue account, after deducting generation and distribution costs, rents, rates, taxes, wages, directors' fees, general establishment and other charges, and proportion of salaries, was £164,043, plus £7,013 brought forward. Interest on the first and second debenture stock and interest on temporary loans, less income tax, absorb £44,215; there is carried to reserve for depreciation, repairs, renewals, etc., £40,000, leaving £86,811 for distribution. Interim dividends on the 6 per cent. preference and on the ordinary (5 per cent.) already paid absorbed £29,909, leaving £56,933. The directors now recommend a further dividend on the 6 per cent, preference shares and a further dividend on the ordinary shares for the December half-year at the rate of 9 per cent, per annum, less income tax, leaving £12,471 to be carried forward. The applications ber half-year at the rate of 9 per cent, per annum, less income tax, leaving £12,471 to be carried forward. The applications received during the past year amounted to the equivalent of 5,206 kw., making the total 51,705 kw. The total units sold were 28,012,741, an increase of 2,269,418 units. The number of consumers has increased during the year from 22,315 to 21,212. In view of the lighting restrictions imposed upon the London areas by the Admiralty in consequence of the war, and which have affected the output, particularly for the last quarter

of the year, the directors consider the results eminently satisof the year, the directors consider the results eminently satisfactory. The issue of 10,000 six per cent. cumulative preference shares and 6,000 ordinary shares made in March last was over-subscribed. Reference is made to the withdrawal of the two London Electricity Supply Bills that were before the present Parliamentary Session. The directors of the Bournemouth and Poole Electricity Supply Co., Ltd., have declared a final dividend on the ordinary shares at the rate of 9 per cent. per annum, making 7 per cent. for the year. The progress made by the Coatbridge and Airdrie Co. during the past year has been satisfactory. been satisfactory.

#### Bournemouth and Poole Electricity Supply Co. Ltd:

The directors' report for 1914 shows that new capit lexpenditure amounted to £14,553, making the total £487, 49. The balance from revenue account, after deducting generation and distribution costs, rent, rates, taxes, wages, directors' fees, general establishment and other charges, and proportion of salaries, is £41,681, plus £2,145 brought forward. Out of this, interest on debenture stock and interest on temporary loans, less income debenture stock and interest on temporary loans, less meone tax, absorb £9.965, leasehold and special redemption funds and interest £1.899, written off suspense accounts £21; carried to reserve for depreciation, etc., £7,000, leaving £24,941 available. Interim dividends on the 4½ and 6 per cent. preference shares, and on the 15,000 ordinary shares (5 per cent. per annum) for the June half-year amounted to £9,337, leaving £15,604. After paying the final dividends on the preference shares, a final the June half-year amounted to £9,337, leaving £15,604. After paying the final dividends on the preference shares, a final dividend on the ordinary shares at the rate of 9 per cent. per annum for the December half-year, less income tax, is declared, leaving £3,829 to be carried forward. The total applications received amounted to the equivalent of 9,664 kw., being an increase of 874 kw. for the year. The total units sold for all purposes was 3,910,511. The Richmond (Surrey) Electric Light & Power Co., Ltd., has declared a dividend of 6 per cent. on the ordinary shares.

Annual meeting, March 18th.

#### Scarborough Electric Supply Co., Ltd.

MR. G. ALDERSON SMITH presided at the annual meeting, held Mr. G. Alderson Smith presided at the annual meeting, held at Scarborough, on February 27th. He referred regretfully to the death of the Secretary (Mr. John Hall, J.P.), who was one of the victims of the bombardment of Scarborough. "I think," he said, "this is the 23rd annual meeting, and at all before this Mr. John Hall was very much in evidence and always gave us all the help he could." Proceeding, the Chairman characterised the financial report as a war budget, because the way was the whole thing that influenced them. In always gave us all the help he could." Proceeding, the Chairman characterised the financial report as a war budget, because the war was the whole thing that influenced them. In effect, they had done very well, because after the first seven months of the year, the remaining months, when they ought to have made their large profit from the hotels and places of amusement, brought them nothing. That was where their loss had been. Practically, the amount brought forward for balance applicable to dividend on the ordinary shares they year was £3,847; last year it was £3,848. If it had not been for the war they should have had a record season. They had spent £285 more on coal. Under other headings they had also spent more. There was not only the war, but also the bembardment of Scarborough. About two hundred of their customers shut up their houses and bolted. They had great difficulty in getting in to read the meters. They had sent circulars to people asking them to send their keys or indicate customers snut up their houses and bolted. They had great difficulty in getting in to read the meters. They had sent circulars to people asking them to send their keys or indicate where the keys were. Twenty had not taken any notice. He thought the refugees had done more harm to Scarborough than the bombardment. He moved the adoption of the report and balance-sheet, with a dividend of 2 per cent., less incometax. This would absorb £2,000, and he explained that they were carrying £1,000 forward against whatever this year might have in store for them. They could only hope that it would be possible for lighting restrictions soon to cease.

Mr. Harold T. Ellis, seconding, said the total number of units supplied was very considerably greater than it had ever been before, and was, he thought, a record. The position brought about by the introduction of the one-watt lamp, which at first did the company considerable harm owing to its extreme efficiency, had now been about recovered by the extra connections. The increase of connections this year amounted altogether to an equivalent of 250 kw., an increase of consumers of 10 per cent. They had in front of them the prospect of the half-watt lamp, which would still further reduce their consumption until they could increase their const

When it came they could look forward with confisumers. dence to being in a much better position to compete against gas. He was afraid there was not much prospect of their being able to make their coal contracts next June at any cheaper rate, and one had to realise, with things as they were at Scarborough now, that their prospects for this year were not very bright.

The resolution was adopted.

The CHAIRMAN remarked that Mr. F. G. Holden, B.A., A.M.I.C.E., had been appointed secretary and manager, thus combining the two offices.

#### Waste Heat and Gas Electrical Generating Stations, Ltd.

The profits earned by the company during the year ended January 31st, 1915, after deducting administration expenses, amount to £39,001, as compared with £38,245 in the previous amount to £39,001, as compared with £38,245 in the previous year, less £10,500 transferred to the credit of reserve account, and adding £12,110 brought forward. The profits available are £40,611, as compared to £37,710. A dividend at the rate of 8 per cent. for the year (the same as for 1913) requires £25,600, and there is to be carried forward £15,012, against £12,110. The reserve account is now £53,351, and the redemption funds in reserve account is now £53,351, and the redemption funds The reserve account is now £53,351, and the redemption funds in respect of plant supplied on hire purchase terms amount to £11,299. The supply of waste heat and gas and the output of electrical energy from the company's generating stations has on the whole been satisfactorily maintained throughout the year. No new generating stations have been erected since the last report, but negotiations have recently been taking place for some additional plant to be installed at Weardale Power Station with a view to the more efficient utilisation of the gas received from the coke ovens. It has also been arranged to erect some further plant at the company's Grangetown power station with the object of maintaining a greater output from that installation. These new works can be carried out at a cost within the cash resources which the company has available and should in due course yield a satisfactory increase available and should in due course yield a satisfactory increase in the revenue.

The company applied for and was allotted £10,000 of the National War Loan 1925-1928, and £3,500 was called and paid up to the date of the accounts now presented.

In November the directors made a preliminary donation of £200 to different relief funds in connection with the war, leaving the matter for the further consideration of the shareholders at the annual meeting. A resolution will accordingly be moved that the company's contribution out of the profits of the past year be increased to £1,000, to be allocated at the discretion of the

The annual meeting was held on Wednesday.

#### W. T. Glover & Co., Ltd.

The result of the trading for the year 1914 is a credit balance of £35,397, plus £5,128 brought forward. Directors' remunerations, voted March, 1914, absorbs £1,000, and directors' expenses £59, interest at 41 per cent. on first mort. debenture stock £4,250, interest at 5 per cent. on second mort. debenture stock £3,712, written off investments £2,139, leaving £29,364. stock £3,712, written oft investments £2,139, leaving £29,364. After deducting £4,000 as appropriation for payment to trustees of second mortgage debenture stock, it is proposed to pay a dividend of 5 per cent. on the cum. preference shares (£100,000) to 31st December, 1914, less income tax £4,615, to transfer to first mortgage debenture redemption fund £2,500, to pay a dividend on ordinary shares (£114,850) at the rate of 5 per cent., less income tax, £5,300, to transfer to reserve fund £5,000, and to carry forward £7,950.

After making the above appropriations, the redemption fund

After making the above appropriations, the redemption fund for the first mortgage debenture stock will stand at £38,000, the redemption fund for the second mortgage debenture stock at £32,000, and the reserve fund at £30,000, making a total of £100,000. The application of the Manchester Corporation to Parliament for power to purchase the business of the Trafford Power & Light Supply (1902), Ltd., was not sanctioned. Annual meeting, March 15th.

#### Newcastle-upon-Tyne Electric Supply Co., Ltd.

Newcastle-upon-Tyne Electric Supply Co., Ltd.

The directors report that the connections to the company's system at the end of 1914 amounted to 231,425 h.p., an increase of 27,757 h.p. The profit for the year is £178,380, compared with £141,140, plus £6,589 brought forward, making £184,969. Interest on debenture stocks, loans, etc., absorbs £52,564, leaving £132,405. The dividend on the 5 per cent. preference shares requires £45,589, as compared with £34,375. A dividend of 3 per cent. on the ordinary shares, making with the interim dividend of 2½ per cent. 5½ per cent. for the year, requires £43,870. There is to be transferred to depreciation account £20,000, as against £15,000; £17,000 is to be put to reserve (as compared with £10,000 last year), of which £7,000 transferred to reserve account, and £5,946 is to be carried forward. The reserve now stands at £10,405, out of which the directors propose to write off part of the remaining cost the issue of second mortgage debenture stock, £10,000, leaving in reserve account £405. The unappropriated depreciation account becomes £153,900, which is in addition to the

items of £170,000 and £8,600 specifically allocated in the balance sheet. The company's plant and system have been efficiently maintained out of revenue, £74,571 having been spent thereon. The additions to capital expenditure account for the year amounted to £129,590, and represent part of the cost of extensions in progress at the Carville and Dunston Power Stations, and also to the company's general distribution system. The sub-division of the company's £5 shares into shares of £1 each was carried out during the past year.

At an extraordinary general meeting held on the 31st March last, the com-

of £1 each was carried out during the past year.

At an extraordinary general meeting held on the 31st March last, the company's share capital was increased by the creation of 165,000 additional preference shares of £1 each, and 165,000 additional ordinary shares of £1 each, in order to acquire the shares of the County of Durham Electrical Power Distribution Co., Ltd

An offer was sent out to the shareholders of the Durham Co., inviting them to exchange their shares for shares in the Newcastle Co. on the terms agreed, and acceptances of this offer have been received from all shareholders excepting four, whose total capital holding represents £400. Certificates for Newcastle Co.'s shares have now been issued against all shares so exchanged. In response to appeals for assistance, on the outbreak of the war, a contribution of £200 has been made to relief funds, and the confirmation of this by the shareholders will be asked for at the general meeting. The shareholders will also be asked to express an opinion as to whether a further amount should be placed at the disposal of the directors to meet other claims for assistance. for assistance.

Annual meeting, March 16th.

#### Para Electric Railways and Lighting Co., Ltd.

DURING the year ended November, 1914, the company had to

During the year ended November, 1914, the company had to contend with great difficulties due to the rubber crisis and stagnation of trade in the Amazon Valley, the further depression caused by the outbreak of the war, and finally the fall in Brazilian exchange, which for many years had been steady at the legal gold rate of 16d. per milreis.

In consequence of these adverse factors the gross receipts decreased from £299,924 in 1913 to £249,891 in 1914. By close attention to economies on the part of the local management, the operating expenses were reduced from £164,261 to £132,491, the net revenue earned in Pará being, therefore, £117,400. As the accounts are based upon the legal exchange rate of 16d. per milreis, there must be deducted £5,914, being the actual loss incurred on remittances, and after providing also for the London expenses the balance of operating revenue is £106,147 compared with £128,857 in the previous year. Adding £777 interest and transfer fees received, and £19,206 brought forward, the total was £126,130, from which the debenture interest and sinking fund of £38,500, and the interim dividend paid on the preference shares, £9,600, are deducted, leaving £78,030. There is to be transferred to depreciation and renewals reserve £15,000, to contingencies reserve £10,000 a final dividend of 3 preparts on the preference shares. feeting £10,000. There is to be transferred to depreciation and renewals reserve £15,000, to contingencies reserve £10,000, a final dividend of 3 per cent. on the preference shares for latter half-year (making 6 per cent., less income tax, for the year) absorbs £9,000, a dividend of 6 per cent., less income tax, on the ordinary shares for the year requires £23,400, and £20,020 is to be carried forward. £20,030 is to be carried forward.

#20,030 is to be carried forward.

If the rate of exchange should remain at a figure below 16d., it will be necessary to adjust the value of local accounts. This is sufficiently provided for in the contingencies reserve, which has a credit balance of £50,522. In August last, when an interim dividend on the ordinary shares would have been declared in the usual course, the directors considered it unwise to reduce the cash resources of the company in London as the general financial position was universally disturbed, exchange was low, and the difficulty of making remittances from Brazil was almost insuperable. All these conditions have since improved. During the year the capital expenditure amounted to £5.828, mainly for extensions to the lighting system. By an active campaign for new business, the number of lighting cursumers has been increased, although the consumption of lighting current has fallen off on account of the domestic economics obtaining.

The sum of £5.609 charged against renewals represents the cost of completing the renewal of the underground cable system. The balance to the credit of the renewal fund amounts to £81,545.

1913. 23,254,258 3,172,069 | 1913 | 1914 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 1915 | 19,339,989 2,974,422

The annual meeting was held on Friday at the Cannon Street Hotel, E.C. Mr. F. Holt, who presided, said that there had been a reduction of £50,000 in gross receipts, brought about by a falling off in the number of passengers, by a more economical use of electricity by private consumers, and by the reduction made voluntarily in the rates charged to the municipality for public lighting. Against this loss they were able to set off a reduction of £32,000 in the Pará expenses. A sum corresponding approximately to the reduced car service was saved in trainway maintenance, and a saving of over £7,000 in the maintenance of the electric lighting installation was in the maintenance of the electric lighting installation was also made possible by the completion of the renewal of the old and obsolete underground cables, which were very costly to repair, and other economies were obtained through the reorganisation of the staff and by the fall that had occurred in the local value of all labour. It was possible that some shareholders might think that rather than reduce the ordinary dividend they should have reduced the carry-forward or the allocation to the funds, but with this view they could not allocation to the funds, but with this view they could not agree. Not only the cash position of the company called for prudence, but they must bear in mind that there were important factors in the business at the present time which were entirely outside of their control, and they therefore had no hesitation in asking them to confirm the reduction from 10 per cent. to 6 per cent., which they proposed as the dividend on the ordinary shares. Considering the unprecedented conditions of business throughout the world, a 6 per cent. dividend well and truly earned was not to be despised, and if any of

them considered that the board had erred on the side of caution, then the money retained was safe and sound in the business and must come into their hands in good season. Having referred at some length to the condition of the rubber industry in the Amazon Valley and expressed the opinion that although in the Amazon Valley and expressed the opinion that although it might be hampered at present it was not likely to be lost to the country, the Chairman said that the rate of exchange was the matter which concerned them more than anything else at the present time. At the outbreak of the war, when Brazil decided to fund the interest on her public debt payable in Europe, it was generally expected that this would have a favourable effect upon exchange and that the milreis would be maintained at or near 16d. The fall to the neighbourhood of 12d, had been a great disappointment to all the friends of that country, and might force them later on in the year to consider whether they would be justified in paying an interim dividend on the ordinary shares, or whether it would be again wiser to wait the result of the working for the full year before considering the ordinary dividend. Their position in Pará was considering the ordinary dividend. Their position in Pará was being watched with the greatest care, and every effort was being made to work as economically as possible. The fall in the price of local labour had enabled them to change from coal to wood fuel in the power house, and they were effecting a very material reduction in the expenses at the present time on this account, which would help them to meet the reduction they were experiencing in the trainway traffic and the loss due to exchange. Strenuous and successful efforts were also being made to encourage the use of electricity for commercial and domestic purposes in Para, and these efforts were undoubtedly helping to maintain the revenue on the electrical side of the business. They had been approached by the directors of the gas and telephone undertakings in Para, which were operated by two English companies, with a view to some arrangement for future management. Those were much smaller concerns for future management. Those were much smaller concerns than their's, and they found in these bad times that the cost than their's, and they found in these bad times that the cost than their's, and they weighed heavily upon them. They of their administration weighed heavily upon them. They both had to consider whether it was better for them to reduce their personnel, which would lead to a less efficient service to the public, or to maintain the efficiency of their service by combining their administrations with theirs and reduce in this way their operating costs. The services which the Pará Co. gave to the public were, they believed, quite satisfactory, and it was to the general interests that the telephone service and the gas service of the town should be maintained on the same level. That was the spirit in which they were approaching the negotiations they had in hand, and if they were able to complete them they felt sure that the city and all concerned would

benefit.

Mr. E. C. Cheston seconded the motion.

The Chairman, in reply to a shareholder, said that except immediately after the outbreak of the war they had not found any difficulty in obtaining remittances from Brazil. The suggestion that they should remit their takings in the form of produce instead of gold was not a feasible one, as it would be much like speculation.

The report was adopted.

## Telegraph Construction and Maintenance Co., Ltd.

THE annual meeting was held on March 4th at 38, Old Broad Street, E.C., the Earl of Selborne, K.G., presiding. The Chairman said that they would be struck by the great similarity between the accounts of this year and the two previous years. They showed that when the plant which belonged to the company was fully employed under normal conditions the results had a tendency to repeat themselves. six months of the period under review had been passed under to the times having been normal, he did not forget that nearly six months of the period under review had been passed under the wholly abnormal conditions due to the war; but owing to the protection of the Navy they had been able to pursue the trading operations of the company under conditions which might almost be described as normal. How wonderful the protection of the Navy was many of their fellow countrymen did not fully realise, because they could not have its doings as frequently and as intimately painted for them in the daily press as were the doings of the Army. In some respects, indeed, he thought the operations of the Navy had been too successful, because owing to the protection it afforded the country many people wholly failed to realise that we were still in the unfulfilled crisis of the greatest war of our history. The conditions of life in the country had been too normal—business should not proceed "as usual," but should be carried on with the war in view. He was glad to say that the company had contributed to the fighting forces of the King. About 170 members of the staff and employés were taking an active part in the war, but their praise should not be confined to those who were fighting, because those who had stayed at home—many of them reluctantly—were contributing to the success of the country no less than those who were engaged in the fighting. Special praise and thanks were due to those who had remained at home as well as to those who had joined the forces. The fact that many had gone away had meant increased strain and responsibility on those who had remained at home. He thought it was greatly to the credit of the staff that they had been enabled to produce such satisfactory results. They had treated these men who had gone away with the same patriotic liberality as most companies. It would be idle to conceal from themselves that

there were no difficulties in front of them. Nobody could say thefe were no difficulties in front of them. Nobody could say how long the war was going to last. He was not one of those who thought it was going to come to a speedy termination; he believed we still had a long and arduous task in front of us, and that we were by no means past the crisis of our fate. Difficulties in the supply of labour must manifest themselves not only in their own works but in the works of those who supplied cables. There were also difficulties of transit; but he sincerely trusted that those difficulties would not be increased by any differences of opinion between employers and employed, either in their own business or in any of the busicreased by any differences of opinion between employers and employed, either in their own business or in any of the businesses upon which they depended. He did not think those difficulties could possibly arise if people really understood that the issue of the war was still in doubt, and that the crisis of our fate as an empire was not past. As a race we were singularly devoid of imagination—we could not see what we did not understand, and he thought the Government and the Press were somewhat to blame in the matter, because he thought the general colour given to the published reports was too favourable. Nobody who had no means of inside information would think that in this war we had had any set-backs tion would think that in this war we had had any set-backs at all. Coming back to their own company, it was interesting and encouraging to note that the shares were quoted at a higher figure to-day than they were when he became chairman five years ago, and he did not think they could have a greater proof of the solidity, stability and honesty of the

Sir James Pender, Bart., seconded the motion, which was

carried unanimously.

## Kensington and Knightsbridge Electric Lighting Co., Ltd.

Col. R. E. Crompton, C.B., presided, on March 4th, at 148, Brompton Road, S.W., over the annual meeting. He said that in the first six months of the year they had to face loss of revenue due to the closing of the museums on account of the Suffragette outrages, and again, the strike in the building trade adversely affected the supply of electric power to this trade, and then they had the coal porters' strike, which increased the cost of coal. Still, by care and economy, and by a small increase in the selling price, they were in a fair way of showing slightly increased profits. Then came the war, and consequently heavy loss of revenue and loss of efficiency due to a number of their staff being called away. The reduction of output realised by the end of the year was about reduction of output realised by the end of the year was about half a million units, which was 7½ per cent. of their output, but on account of their slight increase of price the loss in money but on account of their slight increase of price the loss in money earning was only 64 per cent., as their increase in average price per unit had been rather less than \(\frac{1}{2}\)d. Per unit. On the other side of their balance sheet they had effected notable savings, viz., in the case of generation and distribution \(\pmu3,600\), or 11 per cent.; in repairs to plant \(\pmu8812\), or 11\(\frac{1}{2}\) per cent.; in management \(\pmu792\), or 12\(\frac{1}{2}\) per cent. But against these savings there had been increases in items over which they had no control, such as rates and taxes. The net result has been a total saving on the costs side of \(\pmu4,717\), which so nearly reached their loss in revenue that they had been enabled to recommend the payment of their dividend of 9 per cent. for the year. It was unwise to prophesy, but they hoped that the the year. It was unwise to prophesy, but they hoped that the loss of revenue caused by the war would gradually right itself. At the outset their customers very naturally economised in their lighting bills, and many of them remained in their country residences during the autumn. Again, the enforced dark-ening of the streets, of which they could not complain, would probably in the future not affect them so much as it did during November and December—the time when shop display had ordinarily a very good effect on their revenue—as now owners of shops who relied on display by artificial light were gradually finding means of improving the lighting of their interiors. They were not so anxious as they were, but he hoped the shareholders would realise that they owed their comparatively satisfactory financial results to the extraordinary hard work and devotion of their managing director, Mr. Miller, and the staff, who had worked long hours to obtain the economies he had mentioned and to supply the place of those called away for war purposes. As both the Parliamentary Bills which would have affected their interests very considerably had been withdrawn, he did not propose to say very much on the matter, which had been so greatly discussed in the Press. The London County Council Bill which offered the companies terms of absorption which would have warranted their most careful consideration, had been withdrawn, and the Companies' Bill, which was intended to some extent to supplement the L.C.C. Bill, had been withdrawn at the request of the Government. Their board had co-operated with the boards of the majority of the London companies in discussing these Bills in a manner which they considered wholly satisfactory, and which they believed would be continued if further contingencies of the same class arose. So much had been said in the Press and elsewhere by those advocating gigantic schemes of electric supply for London that he would take that opportunity of pointing out to the shareholders that most of the promises made by the advocates of these schemes were not true in the one important matter, that they promised reductions of price for electric supply which could not be realised; at any rate, so far as they affected the majority of their customers who lived in the residential districts. London had been most unturely compared unfavourably with New York, November and December—the time when shop display had ordinarily a very good effect on their revenue—as now owners

Chicago, Berlin, and other great cities, but in these cities the total cost was shown to be that of the average supply, and total cost was shown to be that of the average supply, and included the supply to railways, tramways and the vast system of power of the industrial districts. This enabled them to show a lower total average cost than in London, where the bulk of the supply still was for lighting purposes. The directors had been for years past fully aware that the only chance of reducing the average cost to their customers in these residential districts was by extending the use of electricity for purposes other than lighting. The board and management had laboured unremittingly in this direction, and the special department appointed to foster this branch of their output had made continuous progress, particularly during the output had made continuous progress, particularly during the past year. The general public, who in most cases were the users of electricity mainly for lighting, and up to the present to a small extent for cooking and heating, ought to know that the cost for all these purposes charged by the company had been carried out to a point far lower than that of the large cities he had named. Although it was obvious that some amalgamation of generating stations would lead to small reamalgamation of generating stations would lead to small reductions in the cost of generating taken by itself, yet the total cost of electric supply, including the many charges dealt with in their balance sheets, would not be sensibly affected. The board regretted the resignation of Mr. R. W. Wallace, who had been a director since the formation of the company. His place had been filled by the appointment of Mr. H. W. Miller as managing director, and he hoped that they would consider that the economies which had been largely effected by the staff, had justified the board's policy in this respect.

Sir H. BLISS seconded the motion.

Mr. Whitiworth said with reference to the reduction of repairs, he would like to know if there had been any tendency to let the plant down in any way. As regarded cooking, he said that the Barnes local authority were actually putting electric appliances into workmen's houses, and he wanted to know

tric appliances into workmen's houses, and he wanted to know if the board could give any information as to the real pro-

if the board could give any information as to the real progress by the company in supplying for cooking purposes.

The Chairman said the board believed the plant was in better condition than any plant in London. Although there had been a reduction in the cost of repairs that year the plant was certainly in as good, if not in a better, position than last year. The installation of cooking and heating fittings into workmen's dwellings was a matter of great importance, but it did not affect their company much, as there were comparatively few workmen's dwellings in the district. What did affect them were the small households and the small shops, and it was to reach them that they started a special departaffect them were the small households and the small shops, and it was to reach them that they started a special department, so as to bring home to them the advantages of electric heating and cooking. Progress was, however, slow, partly because unless people were experienced in its use, the apparatus was likely to break down. Still, the progress was steady.

Mr. Whitworth asked whether electricity stood as well in comparison with gas for cooking as it did for lighting purposes.

The CHAIRMAN said that, personally, he thought it did. Far greater savings were obtained than the householders as a rule realised.

The report was adopted, and the retiring directors were reelected.

#### Underground Electric Railways Co. of London, Ltd.

THE annual meeting was held on March 4th at Westminster Palace Hotel, Sir Edgar Speyer, Bart., presiding. The Chairman said that considering the period of exceptional anxiety and trouble, which so unexpectedly came upon the country last August, he thought the results achieved were satisfactory. It would, however, be idle to deny that he was disappointed that the hopes he expressed last year had not been entirely realised, although the reasons which militated against a more favourable showing were entirely beyond the control of the management. It was not necessary to deal in detail with the operating results of the various companies in the securities of which the Underground was so largely interested. At the outbreak of the war it was felt that no new expenditure should be undertaken for the moment by those companies, and therefore the important works to which reference was made last year should be postponed. Chief among these were the Hammersmith widening, a further arrangement of moving staircases, and the Euston and Camden Town extensions on staircases, and the Euston and Cainden Town extensions on the London Electric; certain improvements, such as the widen-ing of the tunnels at Holborn, and the installation of escalators at Shepherd's Bush. Oxford Circus, and the Bank on the Central London Railway. The Wood Lane extension, which would connect the Central London with Ealing, had made only slow progress. The same policy had been pursued by the District Railway, which had been taken over by the Govern-ment, and which had postponed all new contracts for works that were not absolutely processary. As recorded the City and rient, and which had postponed all new contracts for works that were not absolutely necessary. As regarded the City and South London Railway, the construction work in connection with the widening of the tunnels had not been started. Those postponements were bound to delay the development of the properties and to some extent retard the improvement in their earnings. At the same time he was pleased to be able to tell them that the Queen's Park extension, opened about a month ago, already showed encouraging results. While the war had thus arround a property days large to the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the last of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the propert and unfavourable consequences. The price of coal, which was an important factor in the operation of those railways, had risen very considerably. The prices of other materials had

shown the same upward tendency. This had been felt particularly severely by the railways, which had so far worked on a very narrow margin, and the dividends—none too large in the past—had had to be further curtailed. The distributions for the year in the case of the District II. preference stock amounted to 2 per cent. against 2½ per cent. last year; in the case of the London Electric ordinary ½ the per cent. against 1 per cent.; in the case of the Central London Railway ordinary ½ per cent. against 3 per cent. As regarded the London General Omnibus Co., the Chairman had explained that the Government had taken over a large part of that undertaking for war purposes, and he pointed out that the figures in the company's accounts did not allow for any sums which might hereafter be received from the Government. He had further informed the shareholders that the War Office continued to take 'buses for transport service abroad, and that until some definite understanding with the Government had been reached General Omnibus property it would be premature to go into any details. The London & Suburban Traction Co. began last June to pay dividends on its ordinary shares at the rate any details. The London & Subtroin Traction Co. began last June to pay dividends on its ordinary shares at the rate of one per cent. per annum, but owing to the adverse effects of the war the company was not able to make any further dis-tribution. The dividend on the preference shares, however, had been paid in full. There remained the Associated Equip-ment Co. That company had further developed and shown satisfactory results. It was making extensions and increasing its plant to cope with the additional work thrown upon it, and it was hoped that it would continue to show good returns, although the increased price of materials which was being witnessed everywhere now was a factor which might somewhat affect the results. The revenue account showed that the income from investments, etc., amounted to £684,625; an increase of £54,809. Taking the results as a whole, and bearing in mind the exceptional circumstances under which the companies were worked for the latter part of the year, the Underground had again demonstrated its vitality and afforded proof that in normal times it could count on increased prosperity. Its subsidiary companies performed an indispensable service to London, which was rendered in the most efficient manner. For the excellence of this service they were indebted to the staff of the various companies, and foremost among them to their managing director. Sir Albert Stanley.

Lord Farrer seconded the motion, which was adopted without dispersion.

out discussion.

## Charing Cross, West End and City Electricity Supply Co., Ltd.

THE annual meeting took place on March 4th at the offices, St. Martin's Lane, W.C., Mr. W. F. FLADGATE presiding. The CHAIRMAN said it had been his usual custom in each year to St. Martin's Lane, compare the accounts under consideration with those of the preceding year, but the circumstances of the past year were so abnormal that any such comparison would be quite valueless. As regarded the West End areas, the gross earnings had decreased some £9,153 and the expenses had increased £2,811, while the other for the year  making the net earnings for the year £72,409, or a decrease of £11,964. In July last an interim dividend at the rate of 5 per cent, per annum was paid on the ordinary shares, and as a dividend at that rate could be paid out of the available balance without in any way touching on their reserves or the carry-forward of last year, the board had considered that it was quite justified in recommending a dividend at that rate, carrying the small balance of £304 to general reserve (income account), which would then stand at a little over £7,000. They carried forward on revenue account the £18,000 brought forward from last year, and this, with the £7,000 on general reserve income account, gave them a round sum of £25,000 to fall back upon in aid of the profits for the current year. Their depreciation fund would stand at about £150,000. As regarded the City undertaking, the gross earnings, notwithdividend at that rate could be paid out of the available balance Their depreciation fund would stand at about £150,000. As regarded the City undertaking, the gross earnings, notwithstanding the war, were slightly higher than last year, but, owing to the increase in expenses, the net earnings were £2,474 lower, the net total being £66,706. This, after payment of all interest, provided £36,367, out of which to meet the preference dividend of £18,000. They were therefore able to carry forward £18,000, the amount brought from last year, and by transferring the balance, £18,367, to general reserve and by transferring the balance, £18,367, to general reserve income account, this would amount to the sum of £71,515. It was not proposed to deal at present with this account, nor, as explained last year, to write anything off for depreciation. There was one item on the balance-sheet to which, perhaps, they would think he ought to refer, and that was "Investments at cost." Having regard to the depreciation caused in the theory with the transfer of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the ments at cost." Having regard to the depreciation caused in most securities by the war they might naturally enquire as to whether these ought to remain at the same price. As, however, the whole of these investments were purchases in their own debenture stocks, there was no necessity in any way to write them down. The increase in the cost of materials and labour had been very great. For instance, the way to write them down. The increase in the cost of materials and labour had been very great. For instance, the average price of coal had increased some 13½ per cent, over last year, but he was happy to say, thanks to economies in working, their works costs at Bow had increased less than 4 per cent. while transmission losses had been considerably reduced. The increase in the price of coal was giving them. anxiety, and should it continue there would be no alternative but to increase the price of current, a course which they would only adopt if absolutely necessary. He need hardly

tell them that their business was seriously affected by the lighting restrictions. In January of this year their output was reduced by 14 per cent. in the city, and 20 per cent. in the West End, and these reductions must affect their revenue. No less than 77 of their staff had joined the colours, and the No less than 77 of their staff had joined the colours, and the board, considering it their duty to make some provision for their dependents, were now paying at the rate of nearly £3,000 a year on this account. Last year he called their attention to a scheme which had been put forward to acquire the shares of the electric lighting companies of London and to expend a very large sum of money in building a new generating station with necessary connecting mains, etc. The board did not think the scheme was one which they could support, and a committee representing the majority of the London companies, after consulting engineers of the highest standing, agreed in their view. The scheme was shortly after wards withdrawn. The London County Council had appointed a special committee to deal with this question, and in the wards withdrawn. The London County Council had appointed a special committee to deal with this question, and in the autumn of last year a conference took place at which there was an interchange of views. They pointed out (as they had always done) that in the view of their engineers a gradual change was the only economical and wise course to be pursued, and that they were quite willing on fair terms to cooperate. In the result, a Bill was introduced by the London County Council, which, however, owing to the want of support by the full Council, had to be dropped. There was therefore, no object in troubling them with any details of that Bill, beyond stating that in many respects its provisions did therefore, no object in troubling them with any details of that Bill, beyond stating that in many respects its provisions did not commend themselves to the board. Their committee also introduced a Bill, but, having regard to the decision of the Government that no contentious business should be taken, this had been withdrawn. The committee of the companies had still been kept alive. In their view discussion among themselves and with the London County Council, and possibly the local authorities, could not but be useful, and is and when a scheme could be arrived at they would put it before the shareholders for their consideration. He and his colleagues had in no way altered their view that so far as their company was concerned they were quite content with their present position, and felt convinced that they could continue properly to fulfil the obligations imposed upon them under their provisional orders and to safeguard the interests continue properly to fulfil the obligations imposed upon them under their provisional orders and to safeguard the interests of shareholders. At the same time, they were quite prepared, provided they were fairly met, and provided the consideration to be given to them was a fair and reasonable one, to advise the sale of their undertakings to the County Council. The Council must, however, be prepared to treat them generously and admit that the price which they were entitled to ask to-day was very different to that provided under the Acts under which their original Provisional Orders were issued. They did not admit for a moment, however, that under exist-They did not admit for a moment, however, that under existing conditions (for which they were in no way responsible) London was badly served. In his view the only way in which real progress would be made would be if the Council would authorise their committee to meet that of the companies and discuss the whole question freely and unreservedly. He could discuss the whole question freely and unreservedly. He could not conclude without referring to the very serious times in which they were living, the seriousness of which, he thought, not conclude without reterring to the very serious times in which they were living, the seriousness of which, he thought, was only now being sufficiently appreciated. In referring to these times and the difficulties under which they were working, he felt they owed a debt of gratitude to the whole of their staff for the work which they had done, and were now doing. They must thank those who joined the colours for their patriotism, and equally thank those who had remained with them, and who had enabled them to meet the very serious position in which they were placed by the conditions under which London lived. They did not criticise what was done—they were content to believe that it was done for the best. There might be many dark days before them yet, but let them hope that the not very far distant future would bring brighter times, when the war drum would throb no longer and the battle flag would once more be furled. The pressure upon their business might be severe and the decrease of their profits serious, but they knew that it was entirely and wholly due to passing causes. The earning power of the corporation was in no way impaired, and they saw no reason why they should not look forward to the future with every feeling of confidence and hope.

Mr. J. M. Gatti (managing director) seconded the motion, and they report two releases.

J. M. Gatti (managing director) seconded the motion,

and the report was adopted.

The retiring directors were re-elected, and, on the motion of Mr. Surrage, a hearty vote of thanks was passed to the directors and staff.

#### British Engine, Boiler and Electrical Insurance Co., Ltd.

THE annual meeting was held at 24, Fennel Street, Manchester, on March 5th. According to a report received, Mr. R. C. LONGRIDGE (the Chairman) directed attention to the fact that the business was steadily expanding, the increase in revenue for the past year, as compared with 1913, being £6,625, equivalent to 6 per cent. It was pointed out that this expansion did not involve any deterioration in the quality of the business transacted, as the increased revenue was accompanied by a corresponding increase in the balance of profits, notwithstanding that the company had to meet several heavy claims in respect of breakdowns in the engine and electrical departments. The public, perhaps, did not even fully realise that although

the primary function of an engineering insurance company was to make inspections and ensure safe and economical working, the company also undertook to indemnify power users in respect of material loss. It was reported to the meeting that nearly 28 per cent. of the eligible members of the office staff had joined H.M. Forces, the company taking its share of the patriotic burden by paying full salaries to the absent members and keeping open their places. In connection with the war, it was also reported that the company had been entrusted with the work of inspecting certain kinds of war material ordered from contractors. If this procedure were universally adopted the result would be advantageous to the national interests. national interests.

#### Metropolitan Railway Co.

THE RT. HON. LORD ABERCONWAY presided on February 25th at the offices, Baker Street Station, over the annual meeting. Having dealt at some length with the arrangements made by the Government with the companies, by which he considered the Metropolitan Co. had rather lost than gained, the Chairman gave particulars of some of the special work that their courants had been colled upon to do in the carrying that their company had been called upon to do in the carrying of troop trains and goods trains. Notwithstanding all this extra business they had managed to keep their ordinary serextra business they had managed to keep their ordinary services running except on one or two days of exceptional pressure, and the fact that they had done this on a line that was normally one of the busiest in the country, and had done it without any mishap of any kind, afforded striking evidence of the completeness of their safety appliances, and reflected no small credit upon the officials and staff of the line. Their of the completeness of their safety appliances, and reflected no small credit upon the officials and staff of the line. Their staff had been considerably depleted by men joining the colours. About 430 men had responded to the country's call, and seven had already fallen on the field of honour. The accounts as presented showed that the net receipts for last year, after taking into account the amounts received or receivable from the Government up to the end of December, showed an increase of £25,300, due mainly to the fact that they included a full year's takings of the Great Northern and City line, as compared with only six months of 1913. Their rents showed an increase of £6,000, which they would regard as exceedingly satisfactory, especially in view of the bad times through which they were passing. On the other hand, they had to meet increased charges in respect of the new debenture stock and loans they issued a short time ago, amounting to about £22,000, whilst their interest charges for money borrowed from the bank, etc., amounted to an extra £10,000. In 1913 they commenced to form a new reserve fund for general renewals, and placed to that fund £7,500 out of the revenue for 1913, and £5,000 which they had in suspense in respect of permanent way renewals. They proposed on the present occasion to credit that fund with a further £12,500, which was an increase of £5,000 over the amount taken out of the 1913 figures, and after doing this there was a balance left for dividend on the ordinary stock of £92,000, as compared with £113,000 in 1913. Of this amount £48,490 was absorbed by the payment of the interim dividend at the rate of 1½ per cent, per annum in August last, and the balance would admit now of a further dividend at the rate of 1½ per cent, per annum in August last, and the balance would admit now of a further dividend at the rate of 1 per cent, making 1½ per cent, for the year, and enable them to carry forward £11,458, as against £8,258 twelve months ago. He was afraid there had been some misapprehensi He was alraid there had been some misapprenension in the minds of the public as to what the Government guarantee amounted to. It had been stated that the Government had guaranteed the several companies' dividends, but this was not the case. What they had guaranteed was a certain income from certain sources reduced in a way that he explained. They had not guaranteed their net income, out of which the dividend was paid, and it therefore followed that they had not guaranteed the dividend itself. They thought it wise on this occasion, and having regard to the difficult times it wise on this occasion, and having regard to the difficult times through which they were passing, to follow the example of other companies and to adopt a conservative policy in dealing other companies and to adopt a conservative policy in dealing with the revenue, and in this connection he reminded them that in the matter of reserves the company was in a stronger position to-day than it had ever been hitherto. Their electrical renewals and depreciation fund stood at nearly £67,000, the general renewals fund at £25,000, and the general reserve fund at £60,000. In December last they made an issue of £500,000 five per cent. preference stock at the price of 99 per cent., and the money was payable by instalments during the current half-year. This issue was required in order to repay temporary loans from the Bank and to provide for capital expenditure that they had in prospect. The new sub-station at Drayton Park had been completed, and since September last they had been supplying current for that section September last they had been supplying current for that section of their line from their power station at Neasden. By this means they had effected a very handsome saving in the cost of working that line, and it would interest them to know that of working that line, and it would interest them to know that the estimate made by the general manager at the time of the purchase of the Great Northern and City Railway of the savings that could be effected by their working it had been fully instified by the actual facts. The saving estimated was £12,000 per annum, and to-day they were actually saving at the rate of £11,900 per annum, in addition to which there would be the rent of the disused power house on the Great Northern and City Line as soon as they succeeded in letting it. The new stations at Goldhawk Road and Uxbridge Road on the Hammersmith and City Line were attracting a conon the Hammersmith and City Line were attracting a considerable amount of new traffic, and the escalators that had

been put in at Baker Street to connect their station with that of the Bakerloo had largely increased exchange traffic at that point. The only section of the widening between Finchley Road and Wembley not yet completed was the viaduct at Kilburn. The contractors were pushing on with the work of constructing the new viaduct as quickly as possible; but there was a very serious shortage of skilled labour in the steel trade just at present, and the completion of the work was being delayed in consequence. They hoped, however, to be in a position to open the widening throughout in the coming summer. He had already referred to the extra work thrown upon the company in consequence of the war, and he would like to say how much they appreciated the way in which it had been handled by the staff. In view of the innercase in the cost of living, an arrangement had been made by the companies generally under which the men were to be paid a weekly bonus to supplement their wages during the been put in at Baker Street to connect their station with that by the companies generally under which the men were to be paid a weekly bonus to supplement their wages during the continuance of the present arrangement with the Government. The extra cost involved in this payment was one that, under the terms of their arrangement with the Government, they should bear, and although they had hitherto shown some hesitation in accepting that position, he thought there was no doubt they would eventually recognise that the payment came properly within the terms of their guarantee.

Sir Clarendon G. Hyde seconded the motion.

Mr. Pownall initiated a lengthy and somewhat heated discussion by attacking the board for their acquisition of what he termed the bankrupt Great Northern and City concern, and he also made a strong personal attack on Sir Clarendon Hyde,

he also made a strong personal attack on Sir Clarendon Hyde, who, he said, was a partner in S. Pearson & Co., who owned the bulk of the stock of the Great Northern and City Railway. Mr. Pownall also attacked Mr. Belisha, who had been elected to the board, and declared that the shareholders were being

exploited.

These attacks having been replied to, the resolution for the adoption of the report was put and declared carried by the Chairman. The CHAIRMAN proceeded with the business of the re-election

of the directors and auditors amidst considerable uproar and cries of 'It was not carried."

### Metropolitan Electric Supply Co., Ltd.

The capital expenditure at the end of 1914 totalled £2,228,459, an increase during the year of £56,123. A further amount of £18,632–3½ per cent. mortgage debenture stock was issued during the year. The gross revenue amounted to £215.544, a decrease of £2,061. The working expenses were £114,611, an increase of £3,294. The revenue for the first half of the year showed a satisfactory increase, but it was scriously affected during the last half by the diminution in lighting due to war conditions. That the net decrease was no greater is due to the large amount of new business obtained in the Western areas. The balance at the credit of the revenue account, before providing for depreciation, is £100,933. The directors have set aside £22,000 as an addition to the depreciation and reserve fund, which, after writing off certain items, now amounts to £382,745, carrying to the credit of the net revenue account £78,933, which, with the balance brought forward, interest and dividends on investments, and other receipts, makes a total of £90,485. After deducting interest on debenture stocks and loans, dividend on preference shares and other charges, there remains a balance of £38,795. As already announced here the directors recommend a further dividend of one shilling and sixpence per share (being at the rate of 3 per cent. per annum) on the ordinary shares, making a total for the year of three shillings and sixpence per share, or 3½ per cent. This will leave £3,795 to be carried forward. The report mentions the two London Bills that have lately been dropped for this year. THE capital expenditure at the end of 1914 totalled £2,228,459, mentions the two London Bills that have lately been dropped

for this year.

During the year new connections representing the equivalent of 51,666 25-c.r. lamps, equal to 1,550 kw., were added to the company's system, making a total connection at the end of the year of 1,138,496 lamps.

Annual meeting, March 16th.

#### Edison Accumulators. Ltd.

At the first annual meeting, which is being held in London Ar the first annual meeting, which is being held in London to-day, the directors will submit their first report (for the period ended 31st December, 1914). This states that the work of the year has consisted largely of demonstrations, made in most of the important towns, with a view to bringing the vehicles equipped with Edison batteries to the notice of users of various classes. Although the results of this work will be appropriate in future treatment the director bars have harden being the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the st of various classes. Although the results of this work will be apparent in future years, the directors have decided to write off the whole of the expenses thus entailed. Orders have already been obtained for upwards of 100 electric vehicles, and as the working results become better known it is confidently anticipated that large orders will result. Important establishments that have been testing delivery vans fitted with Edison accumulators have already been sufficiently safited with results to place further orders, and one London firm will shortly have over 50 of these vehicles in regular service. Electric trucks for the conveyance of materials and goods in works and warehouses are being tested by railway companies and others with satisfactory results. A tipping wagon to meet the requirements of the municipal authorities has been designed by the company's engineers, and orders for several of these have already been placed. A number of Edison accumulators have been supplied for automobile, omnibus,

and yacht lighting, for which they are specially suitable.

Mr. Arthur L. Pearse, who was elected a director at the inception of the company, had to resign on account of ill-health, and Mr. C. W. von Roemer was elected a director in

his stead.

The profit and loss account shows a gross profit from trading account, £8,980, and a net loss of £1,669, for the period.

#### Berlin Grand Tramways Co.

THE report for 1914 of the Grosse Berliner Strassenbahn A.G., states that the traffic declined in the first seven months down to the outbreak of the war, as in the second half of 1913, in conse-quence of the extension of the Elevated and Underground Railway, the motor omnibuses and the municipal tramways, whilst in the later months the undertaking stood under the influence of the war and its effects upon the general economic situation. Although the early days of the mobilisation resulted in an increase in the traffic, the latter receded in the first months of the war by 13 per cent. as contrasted with the corresponding period of 1913, and by 15 per cent. in the month of December. On the other hand, the unexpected calling up of over 50 per cent. of the employés rendered it necessary for the company to at first reduce the mileage run by 25 per cent., as it was impossible to replace over 5,000 men at once. Several lines were entirely discontinued, but on those remaining the speed was increased and an additional number of trailers put in service, although the frequency of the services was currailed by 50 per cent. A large number of the wives of employés at the front were trained as conductors—over 600—but the training of drivers was extremely difficult, as most of the instruction staff were also requisitioned by the military authorities. way, the motor omnibuses and the municipal tramways, whilst training of drivers was extremely difficult, as most of the instruction staff were also requisitioned by the military authorities. Nevertheless, it was eventually possible to lower the 25 per cent. restriction to 15 per cent., as compared with 1913, so that the services were equal to the traffic by the close of the year. The gross receipts amounted to £2,118,000, as against £2,288,000 in 1913, and the total expenditure was £1,300,000 and £1,342,000 in the two years respectively, the percentage of working expenses to gross receipts having risen from 58.64 to 61.37 per cent. last year. After making provision for depreciation and other charges, the accounts show net profits of £328,000 as contrasted with £468,000, and a dividend of 6 per cent. is proposed, as against 8 per cent. for 1913.

## STOCKS AND SHARES.

Distinct improvement has taken place in Stock Exchange conditions. The change is marked more in the tone of markets as a whole than in the amount of business which comes into the House. But the latter has certainly improved during the last few days, and the disposition is to buy securities not only in the popular sections, but in some of those which have scarcely moved since the war broke out. The chief animation

scarcely moved since the war broke out. The chief animation at the moment is in oil shares. Rubbers, however, are on the move. Many departments of the industrial section have cheered up. Under the Treasury regulations, jobbing is cramped, cabined and confined, so that a little selling or a little buying has an effect almost absurdly disproportionate.

The reason for this marked alteration is, primarily, the increased public confidence engendered by the steady passage of the Fleets up the Dardanelles. This has had the effect of bringing into the Stock Exchange some of the money hitherto læked up on deposit in the banks. United States advices, moreover, are cheerfuller, though this is not a point to be laboured, since the recovery in values on the other side of the Pond appears to have for its base a vague hope of early peace—a consummation as devoutly desirable as it is for the time being impossible of verifying, or to do more than hope for.

for.

While affairs in the United States look better, those in Mexico are more than ever at sixes and sevens. The latest news is that the present so-called government is threatened with an army marching against it from the North. In the circumstances, therefore, it can be well imagined that the speculator may elect to put money into Mexican issues, but that the ordinarily-cautious investor eschews for the time being even those bonds which before the revolution were regarded as first-class.

garded as first-class.

Travelling further South, optimism again comes into play by reason of substantial recovery in the Rio rate of exchange From 12\(^4\)d., the exchange rose sharply to 13 1-16d., and Brazilian Tractions responded with a further rally to 53. No appreciable change occurred in Rio Tramway bonds or others connected with this group, so far as quotations were concerned; but instead of there being free sellers in the market, the position swung round to the sellers holding back and buyers revealing themselves more plainly than they have done for some time past. for some time past.

At the meetings held so far by the London electric supply companies, the chairmen have naturally dwelt upon the difficulty surrounding deliveries of coal, which are more pressing than the matter of turning down London lights. The cry for Government intervention has so far evoked no sympathetic response, and the market for coal seems to be as strong as every the respective of the trouble new work its own remedy. response, and the market for coal seems to be as strong as ever. The severity of the trouble may work its own remedy, because the worse the former becomes, the graver is the outlook for everything depending upon this source of heat. Oil shares, incidentally, have benefited by the jump in the price of coal, since it is assumed that when the Dardanelles are cleared and Russian oil supplies can flow freely through the Mediterranean, they will be eagerly taken for many of the uses for which at present coal is required.

Most of the figures are available in respect of the profits made during 1914 by the London electricity undertakers, and it is interesting to note how the comparisons come out against the figures for 1913. The following table analyses the results obtained by those companies whose figures are now pub-

The London Company, which shows the best figures of all, The London Company, which shows the best figures of all, had the somewhat adventitious aid of a remunerative contract from the London County Council, in consequence of the Council's electric current failing for the trainway system. Next to this, the County of London makes the best showing, its figures exhibiting improvement all along the line. It is worth pointing out that out of the gross profit of £16,231, all but £1,256 has been retained in net—a striking testimony to the management of the company and to its powers for picking up more in one direction than it has lost in others. The reports have had the effect of strengthening prices as a whole, as will be seen from the accompanying sets of Stock Exchange quotations: quotations :-

The fall of 10s. in Westminsters is hard to explain, except

The fall of 10s. in Westminsters is hard to explain, except on the ground that a seller who wanted to realise his shares found them difficult to place.

Remarkable activity has been displayed in the shares of the British Aluminium Company and in Edison & Swan. The former company is said to be doing extremely well from Government contracts for aeroplane work, and that the Ediswan is also making excellent progress is generally known. British Aluminium have been as high as 25s., coming back a little to 23s. 6d. Ediswan partly-paid at 14s. 6d. are 3s. higher, and the fully-paid 2½ are 5s. better on the week. Manufacturing issues on the whole are strong. Telegraph Constructions have put on 10s., and there are buyers about both for Henleys and Callenders.

Home Kails are a trifle firmer. Underground Electric in-

tions have put on 10s., and there are buyers about both for Henleys and Callenders.

Home Rails are a trifle firmer. Underground Electric income bonds at 80½ show a rise of ½. Metropolitans firmed up to 29, but Districts at 17 are a dull spot.

The feature in the Telegraph section is a brisk rise in the price of Marconis. At 1 13/16 they are 3s. 9d. up, and, following them, the preference hardened at 32s. 6d. For these improvements the market has it the company is doing splendid business, which is probably the case. Moreover, there are buyers about. It is interesting to notice that the shares are within 2s. 6d. of their end-July quotation. Globe preference and ordinary are both 5s. harder, on the declaration of the usual dividends. Cuba preference, which had been unduly depressed, recovered just as suddenly as they were put down; and the few shares which, coming to market, had the effect of dropping the price violently, have been absorbed. The Anglo group is steady, and there is no change worth mentioning in the Eastern division. In the Armannent section, the leading shares hold their prices with tenacity, and Vickers hardened a few pence. The rubber market, as already mentioned, is improving. Business shows a tendency to broaden, the demand coming from the provinces as well as from London. With the fear of Continental sales removed, through the rigour of the Treasury regulations, the market is inclined to take a cheery view of the outlook, and this disposition has been underlined by the quiet buying of the best-class shares.

	TRADE	STAT	ISTICS	OF SPA	IN.					
The figures given below show the imports of electrical and similar goods into Spain during the year 1913, according to the official statistics recently issued. It will be observed that there is a predominance of German trade in practically every branch. The figures for 1912 are given for purposes of comparison, and

Tungsten Wire Patents,—Some time ago five German firms opposed the grant, in the name of the A.E.G., of a patent concerning the manufacture of drawn tungsten wire for incandescent lamps, but they were unsuccessful. Since then the firms have proceeded further by attempting to obtain a declaration of nullity. The German Patent Office has now rejected these claims, and maintained the patent in the form in which it was originally issued. According to this decision, lamps with drawn tungsten wire, as at present customary, can only be made by the three members of the existing patent combine—the A.E.G., Siemens & Halske, and the German Iucandescent Gas Light (Auer) Co.—and their licensees, of whom the Bergmann Co. is one. It is not improbable that in view of the importance of the question to lamp makers who are outside the patent combine, the matter will be brought before the Imperial Court.

## TRAINING FOR THE INDUSTRIAL SIDE OF ENGINEERING.

THE paper read by Mr. A. P. M. FLEMING before the Institu-TION OF ELECTRICAL ENGINEERS at Manchester was abstracted in our last issue; the following is a report of the discussion:-

Prof. MARCHANT said that it appeared a physical impossibility for a man engaged in manual or other labour during the day to study effectively and secure technical education during the evening. The Westinghouse scheme was to be recommended as affording men and apprentices an opportunity of gaining some knowledge during the day time of the theoretical technique of their profession. The statement made by the author that the fitness of a man for the profession of engineering depended upon his inherent characteristic could , not be too strongly emphasised; not every student who entered a college for engineering training would necessarily make an engineer. Regarding technically trained students, the main point of importance was breadth of view rather than technical knowledge. After training in fundamental principles, if a man showed any capacity at all he might carry out some logical investigation on his own account. Specialised fundalogical investigation on his own account. Specialised fundamental principles combined with a certain amount of research work would produce in the end a competently well-trained technical engineer. In the matter of training, a man's point of view was of much more consequence than the facts which he had accumulated. He supported the author's view that technical men should undergo college training before works training. A boy leaving school was far better able to take advantage of college training at once rather than after spending some time in the works. In electrical engineering, with its extremely difficult technique and the considerable amount of mathematical knowledge required, this system had certainly proved best in the speaker's experience.

Mr. H. M. Mensforth said that 5 per cent. clever mathematicians would permit them to get along very well. It was the remaining 95 per cent. that required consideration. Two important points for development in the student's mind were

remaining 95 per cent. that required consideration. Two important points for development in the student's mind were the power of observation and sympathy with the men he would have to control. The most difficult vacancies to fill were those in the works; commercial and designing engineers were easily obtained, but men with technical education and knowledge of how to deal with labour were very scarce. Technical colleges would do a good service if the opportunities of this side of the profession were pointed out to students. Prof. Miles Walker said the efforts of the Manchester School of Technology were mainly directed to technical training, and there was a sufficient demand for it; hundreds of men were dealt with in the day classes: but thousands in the

School of Technology were mainly directed to technical training, and there was a sufficient demand for it; hundreds of men were dealt with in the day classes; but thousands in the evening classes. Men who, year after year, after their day's labour, did really good honest work three evenings per week and home lessons on Saturdays and Sundays, must possess admirable qualities. It would require an exceedingly large institution to deal adequately with trade classes, but such were desirable, and preferably in the day-time. It was hardly fair to expect the manufacturer to put aside a great part of his works for the purpose of teaching apprentices; there ought to be a national system carried out in the same way as technical instruction for engineers. Such an institution would enormously increase the efficiency of the workmen. The effect upon the moral character of the men had also to be taken into account. If from the first an apprentice was placed under the influence of a teacher who dealt not merely with the technique of the work, but also with such aspects of moral character as controlled or affected the production of the work, it would be an enormous benefit. He agreed with the "college first" system. If possible, the student should have a year at the works, where he could be taught discipline and have to rough it with other workmen, but this year should be an extra, and should not be deducted from the subsequent college training.

Mr. J. L. PATON (Headmaster, Manchester Grammar School) said that every boy who started in the works should, if capable, have a chance of rising to the top positions. Statistics

said that every boy who started in the works should, if capable, have a chance of rising to the top positions. Statistics had shown in connection with the cotton trade that over 50 per cent. of the heads of firms and departments had risen from the ranks, and the vitality of our cotton industry was largely attributed to this fact. In the Navy every man was taught: even a stoker, signed on for a short period, was taught something about the running of engines and kept in touch with English literature. The result was that such a man could always find work on the termination of his period of

could always find work on the termination of his period of service in the Navy. A wise man might lay down exactly on what lines a problem was to be solved, but its solution depended upon the hearty concurrence and co-operation of every unit concerned, and in the engineering trades these units included the unskilled labourer.

Mr. A. J. Crider said discussion on this subject always brought out two lines of complaint: first, the superficially educated state in which young people of both sexes were allowed to leave school; and, secondly, the lack of co-ordination between employers, employés, and educational authorities. Modern methods would probably give better results in the near future. Co-ordination did not exist to the extent that it should between employers and educational authorities. He

advocated the sandwich system of training. On account of the physical strain, works teaching was preferable to evening school work, and whilst nothing had been said about correspondence tuition, this would appear to demand more concentration than a young apprentice could give, principally because he had not been trained to give it. Whilst it seemed wrong to exalt the commercial man at the expense of the engineer without commercial experience, it was not right to despise commercial ability. It had been suggested as an argument against training apprentices in works that they moved to competitors who had the benefit of the training. The only reply to this argument was that an employer could not expect a man to serve him for life solely because he had trained him; the man must be properly paid to be retained.

Mr. Eustace Thomas thought that the two things insufficiently distinguished in technical training were understanding what was being done, and doing it. Ninety-five per cent. of advocated the sandwich system of training. On account of

what was being done, and doing it. Ninety-five per cent. of the people in engineering work had to do things. Probably the quality which made a man a foreman or manager was his the quality which made a man a foreman or manager was his power of influencing other people and getting things done without disturbance. It seemed as though the more people studied, the more they killed off that power. He thought the problem would be solved by practical men getting in touch with the boys associated with the technical schools and working out means whereby the engineering instinct could be fostered at the same time as there was instilled sufficient technical training to make it useful all round.

Dr. G. W. WORRALL said it was pleasing to note that the author regarded the character of the man as of at least equal

Dr. G. W. Worrall said it was pleasing to note that the author regarded the character of the man as of at least equal importance to his skill, but, unfortunately, manufacturers did not exert themselves very much to maintain the high standard which they expected in their apprentices. It was to be hoped that the ideals set forward by the author would soon be accepted by firms, as a general complaint amongst university men was that their scientific knowledge was exploited by manufacturers and they were given work in the design office or on the test-plate where they would be most useful to the manufacturer without regard to their future. He had in the course of his business seen many youths quite unsuitable for engineering blocking the way of better men, and it was lamentable to see young men on the test-plate with ambition and ability to rise to the top, receiving less remuneration than labourers simply because, as one manager expressed it, the work was "unproductive." Schemes of education were useless if not accompanied by proper remuneration. Germany, wish was unproductive. Schemes of education were useless if not accompanied by proper remuneration. Germany, with all its educational advantages, had tens of thousands of young men holding diplomas and university degrees who were draughtsmen in receipt of a mere pittance, and after hearing

so much of Germany's fine system it was surprising to find how little the individual man benefited.

Mr. J. Collings strongly advocated night schools, and considered that men willing to work all day and then attend school in the evening were men of character and likely to achieve success.

school in the evening were men of character and likely to achieve success.

Mr. J. W. Lord said a junior technical school had been opened at Newton Heath, Manchester, to provide for boys of 15 or 16 who intended to enter some branch of the engineering trade. They would at first be artisans, but there was nothing to prevent their rising to the class designated as the "technical class." The difficulty of establishing trade schools was greater than was generally imagined on account of the great variation in trades in the district.

Mr. A. N. HOWARTH expressed admiration of the Westing-

recented class. The difficulty of establishing trade schools was greater than was generally imagined on account of the great variation in trades in the district.

Mr. A. N. Howarth expressed admiration of the Westinghouse system and said that the boys were quick to appreciate the advantages which the present journeyman was unable to obtain in his apprentice days. In the case of apprentice draughtsmen, shop training was essential, and in later years this works training was reflected in the common-sense simplicity of their drawings. A point of advantage in the apprentice school was the close relationship between the management and the boys. Their different characters and temperaments could be studied with a view to their ultimate positions.

Mr. R. W. Paul. (in a communication) said that the necessity for the better trade instruction of electrical craftsmen had long been felt and was emphasised by the present crisis, a good deal of the delay in supplying the needs of our fighting forces might have been obviated if such instruction had been systematically adopted in years past. Even in normal times there was no longer an adequate supply of all-round mechanics, like those of twenty-five years ago. Any person responsible for engaging mechanics for highly-skilled work must be impressed with the limited trade knowledge and abilities of the majority of applicants; on new and unaccused much economic waste. Generally the best craftsmen and most successful leaders had learned their business in small shops, where adaptability and all-round skill were required. The Westinghouse Co. was setting a splendid example to those firms who had not hitherto taken their full share in the training of the workers, on whom their success largely depended. The effort and expense, however, should be equitably distributed among all the firms of any given trade, since the benefits accrued to all alike. The initiative must come from the educational authorities and trade unions might reasonably be expected. The latter might assist the movement instructing ex-apprentices to prefer employment in those shops where the apprentices were properly instructed. Apprenticeship was necessary for the craftsman, as distinguished from the operator or machine-minder; the functions of technical

colleges and evening institutes, as at present constituted in England, bore little relation to the training of craftsmen. Ih his own works a shop had been equipped for instructional purposes, and the apprentices were no longer encouraged to attend evening classes. He hoped that the firms engaged in the electrical trade might soon confer together to promote definite and systematic trade training in their branches.

Mr. Fleming, in reply, said that a young man who had risen from evening schools had most excellent qualities. Unfortunately, the rate of educational mortality among evening men

Mr. Fleshro, in Feply, said that a young man who had fisen from evening schools had most excellent qualities. Unfortunately, the rate of educational mortality among evening men was fearfully high, the numbers at the start and finish being very different. The weeding-out of men unsuitable for engineering work was most important. Research work was excellent during training if utilised to develop the men along useful lines. He agreed as to the importance of getting sound men rather than highly educated men. Mr. Mensforth had spoken of the use of technically-trained men on the works side of the organisation. Such men were required to have sympathy with the workmen and to be able to understand and handle workmen. Possibly the man for the works was born rather than made. Really good men were wanted and there were excellent possibilities for the right men. The junior technical school was a promising inovement, and another school was to be started at Openshaw (Manchester). The works school afforded an unrivalled opportunity of getting in touch with each boy in the works, of seeing his worth, encouraging him and giving him every opportunity to rise if he had the ability. he had the ability.

#### ELECTRICITY APPLIED TO MINING.

By C. P. SPARKS, M.I.E.E.

(Abstract of paper read before the Institution of Electbical Engineers, February 25th, 1915.)

#### (Continued from page 341.)

The following are the consumptions of low-pressure and high-pressure steam per kilowatt-hour when working under mixed-pressure conditions:—

		of Low	b. of Hig	Vacuum ( Jar. = Ju in.)	
Full load	 •••	20	 6.4		27.5
3 1	 •••	20.6	 3.6		27.65
i-load	 	40	 _		27.9

The latest application is at Bargoed, where the exhaust from three main winders, a steam compressor, and fan is utilised. Owing to the considerable back pressure on the main winders with the Rateau system (2½ to 3½ lb.) it was decided to adopt the Samuelson system. The steam accumulator is of the gasometer type having a capacity of 12,000 cubic feet, the dimensions being: Internal diameter, 30 ft.; height closed, 19 ft. 2 in.; height extended, 39 ft. 6 in.

The average quantity of steam dealt with is 60,000 lb. per hour, the momentary maximum rate of flow being 160,000 lb. per hour; any excess steam not used by the turbine passes to the feed-water heater. The back pressure on the main winders never exceeds 0.5 lb.

main winders never exceeds 0.5 lb.

main winders never exceeds 0.5 lb.

Owing to the pressure variation being very small it is impossible in this instance to control the admission of the low-pressure steam to the turbine by change of pressure, as in the Rateau system; the supply of exhaust steam is therefore directly controlled from the steam accumulator, an oil relay valve being actuated when the former is 2.5 feet from its lowest position, which valve definitely closes the low-pressure steam valve on the turbine until a further supply of exhaust steam is available.

Exhaust steam is supplied to a 2,000-kw. 3.000-r.p.m. Fraser

steam is available.

Exhaust steam is supplied to a 2,000-kw. 3,000-r.p.m. Fraser and Chalmers—Siemens turbo-alternator. This set supplies current into the common network. The governing is extremely good, and no difficulty has been found in changing from low-pressure to mixed-pressure steam, the interchange of load with the gas-engine plant not exceeding 100 kilowatts with the turbine fully loaded.

The condensing plant is of the jet type with a Leblanc air pump and circulating pump driven by a 160-H.P. motor at 480 r.p.m.

The following are the steam consumptions per kilowatt-hour of this plant when operating under mixed-pressure conditions of the plant when operating under mixed-pressure conditions. tions

The main switchgear controlling this set is erected in the The main switchgear controlling this set is erected in the gas-engine house, the excitation and speed regulation being motor-controlled from the main switchboard through relay cables. Supplementary main switchgear is fixed in the turbine house, but this is only operated in an emergency.

The number of working coke ovens at Bargoed is 100; the average quantity of coal carbonized per week is 4,700 tons, and average output of coke 3,800 tons.

The gas-engine plant is part of Mr. E. M. Hann's scheme for dealing with small coal. The "smalls" from the Rhymney Valley are washed and mixed at Bargoed; after extracting the nuts, beans, and peas, the smaller sizes, less "duff" which

is used for patent fuel, are delivered by aerial ropeway to the ferro-concrete coke-oven bunkers holding 1,200 tons.

The whole of the gas from the ovens is treated for by-product recovery. After passing through cooling towers, the tar, averaging 56 lb. per ton of coal carbonized, is extracted, this being afterwards distilled into creosote oil and pitch.

Sulphur is then extracted by oxide of iron, the iron sulphide being made into sulphuric acid, part of which is used for fixing the ammonia, something like 19 lb. of sulphate of ammonia being produced per ton of coal carbonized.

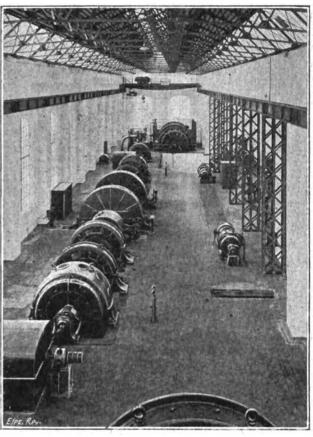

FIG. 1.—GENERAL VIEW OF ILGNER WINDING PLANT AT BRITANNIA COLLIERY.

About half of the total quantity of gas is required for heating the ovens; the balance, which is used for the following requirements, is delivered to a gasometer holding 300,000 cubic feet:—

Gas engines of the Nuremberg type, double-acting 4-cycle, are direct coupled to flywheel alternators, one of 1,000 K.V.A., and two of 2,000 K.V.A. rating, running at 3,000 volts and 100

The smaller set is of the tandem type and the larger sets twin tandem, developing at normal full-load rating 600 B.H.P.

Cylinders 34 in. × 43 in, stroke. Weight of flywheel of 2,400 b.h.p. sets 76 tons. Diameter of shaft of 2,400 b.h.p. sets 30 in.

Diameter of shaft of 2,400 B.H.P. sets 30 in.

These plants were originally worked at average loads of 700 and 1,400 kilowatts. The combined maximum load for one large and one small set is 2,500 kilowatts, the usual practice being to run one large gas engine continuously and the smaller gas engine during the day shift.

When working at these loads, the cost of repairs was found to be unduly high on cylinders, pistons, piston rods, and exhaust valves, and since 1912 the plants have been worked at average loads of 600 and 1,200 kilowatts, the combined maximum load being 2,200 kilowatts. Since modifying the rating of this plant, the life of pistons, piston rods, and exhaust valves has increased, and no cylinders have been cracked.

Tests showed that the heat consumption of the 2,000 k.v.a. sets was:—

sets was:

At full load 12,800 B.Th.U. per kw.-hour At half load

In order to utilise the surplus gas to the best advantage, electric pumping was adopted simultaneously with the erection of the gas-engine plant, and by providing high-power pumps and increasing the size of lodge rooms it was found possible to confine the hours of pumping to from 8 to 12 per

maximum load of 2,200 kilowatts, the annual load factor of the gas-engine station is 72 per cent.

No general statement can be given as to the total fuel consumption, as in the case of the Powell Duffryn Company 14 million units are generated by coke-oven gas, about 14.5 mil-

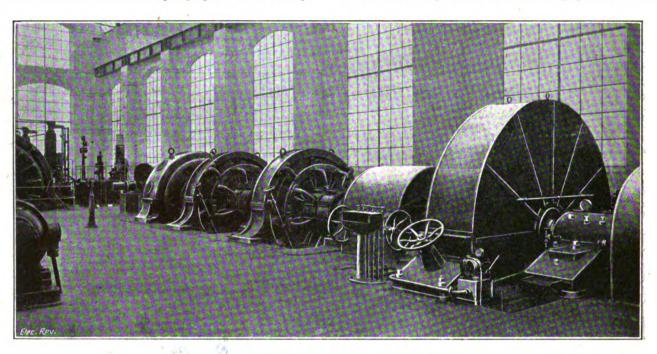

FIG. 2.—ONE OF THE ILGNER CONVERTER SETS.

day at the Elliot Pit. The gas-engine plant thus supplies the general colliery demands during the day and the main pumping at night.

With an output of 14 million units per annum and a

lion by exhaust steam, and the balance of 21.5 million by live

steam.

In the case of the Aberaman Collieries, the weekly coal consumption, operating on a station load factor of 47 per cent.,

is 2.9 lb. of fuel (one-third washed "duff" and two-thirds grains), the average calorific value as fired being 12,600 grains), B.Th.U.

The comparative heat consumptions per watt-hour for the gas and steam stations are :-

Factor B.Th U. 1 er Watt-hour 2 per cent. ... 18.0 72 per cent. Gas Live steam ... 47 per cent. 36.5

Winding Gear.—The Britannia pits of the Powell Duffryn Co. are equipped with two main winders, supplied by Messrs. Siemens, the mechanical parts being by Messrs. Fraser & Chalmers. Each winder has a parallel drum 14 ft. in diameter, for use during the sinking period, designed to form part of the final drum 14 ft. to 22 ft. of cylindro-conical type, and is coupled direct to two motors, rated to develop as a maximum 4,300 horse-power (figs. 1 to 4).

The 10,000-volt 3-phase supply is converted to continuous current by two Ilgner converter sets, designed for a winder duty as under:—

duty as under:

Depth of shaft ... ...
Output of coal per hour
Net load of coal per wind

Each converter set is capable of supplying one main winder (fig. 3), and consists of an induction motor, two continuous-current generators, and a 30-ton flywheel. When the colliery is further developed a third (spare) Ilgner set will be added. The two sets are erected in line, with three needle-type flexible couplings, combined with friction clutches, between the

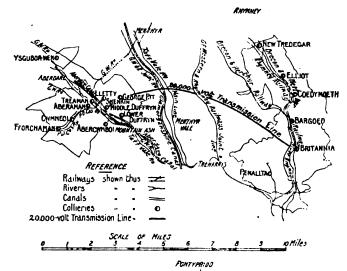

FIG. 5.—PLAN OF POWELL DUFFBYN COLLIEBIES.

wheels and converter sets, so that the two flywheels can be run together with either converter set, the two sets being 100 ft. in length over all.

Owing to the proximity of the winder house to the shafts, special care was taken in the design of the foundation. The main foundation consists of a reinforced concrete girder.

During the sinking period one converter set was used for both winders, each of its generators supplying one motor on each winder. As the 10,000-volt supply was not available at the commencement of the sinking, the induction motors were supplied at 3,000 volts, their stator circuits being temporarily supplied at 3,000 volts, their stator circuits being temporarily connected in mesh; the motors then each developed a maximum of 750 B.H.P., being designed for full-load output, when star connected, at 10,000 volts.

The motors are of the enclosed self-ventilating type, drawing air through dry-air filters and discharging it direct into the winder house.

winder house.

When the main winder is working at full duty raising six tons of coal per minute, the input of the Ilgner set will aver-

age 1,300 kw.

The speed of the motor is controlled by series transformers in the motor circuit, the secondaries of the transformers supplying current to an induction motor arranged to vary a liquid resistance in the rotor circuit. The maximum slip-ring

voltage is 700 volts.

Each set of variable-voltage dynamos is designed for a maximum output of 3,500 kilowatts, the continuous rating being 2,100 kilowatts.

Pressure per machine, ± 600 volts; efficiency, 93.2 per cent.; temperature rise, 40 degrees C.

These machines are of the 8-pole type fitted with inter-poles and compensating windings and double ventilated commutators of 3 ft. diameter.

Each flywheel is a solid steel casting weighing 30 tons, in

Each flywheel is a solid steel casting weighing 30 tons, in a planished steel casing.

Diameter, 12 ft. 6 in.; width of rim, 30 in.; stored energy at max. speed, 31,000 ft.-tons.

The bearings are water-cooled, ring-lubricated. Auxiliary pressure lubrication is supplied, by motor-driven pumps, from an overhead tank, and is used when starting up and during the summer months.

the summer months.

Each winding drum is coupled direct to two motors, one on each side (fig. 4). These machines have 16 poles and are fitted with interpoles and distributed compensated windings. The commutators are of 7 ft. 3 in. diameter, built in two parts with ventilating channels between them. Each motor is rated to have a maximum output of 2,150 horse-power, the continuous rating being 1,300 s.h.p. The voltage at the armature terminals varies from 0 to ± 600 volts.

Speed, 62 r.p.m.; efficiency full load, 92 per cent.; temperature rise, 40 degrees C.

The excitation for the fields of the winding motors and of the variable-voltage dynamos is supplied by one of two 80-kw. 220-volt motor-generators, fitted with boosters. An accumulator of 60 kw. capacity on the half-hour rating is also provided.

The battery floats on the exciter system, so that in the event of an interruption of the main alternating-current sup-

ply, a wind could be completed by means of the stored energy in the flywheels.

The connections to the control board are arranged so that The connections to the control board are arranged so that any two of the four dynamos can be run in series with the two motors of either main winder. The winding motors are controlled by varying the excitation of the generators, the main circuit never being opened.

The control gear consists of three levers:—
The main control lever controlling the excitation of the generators supplying the winder.
The working brake control lever

The working-brake control lever. The emergency brake.

These three levers are interlocked with each other in such way that full current cannot be applied to the winding motor while the brake is "full on," and also the brake cannot be applied whilst the full current is flowing in the motor. An aterlock is also provided so as to prevent the trip gear of the mergency brake being reset unless the main control lever is 1 the "off" position and the brake control lever in the "full 1.1" position.

The main control lever, which is connected to the main antrollers and depth indicator, is controlled by cams on the

The main control lever, which is connected to the main controllers and depth indicator, is controlled by cams on the latter so that the winding motor cannot be accelerated beyond a predetermined rate. Should the driver neglect to operate the control lever, the winding motor is automatically retarded and brought to rest.

The brake control lever is connected to a cross shaft which coupled to the operating valve on the brake engine.

The emergency brake is applied by either of the following

I Leans :-

1. By hand.

2. By the current failing.

3. By the air pressure failing.

4. In the event of overwind by either cage.

5. In the event of excessive overload on the winding motor. The drum shaft is of 24 in. diameter and 3 in. bore, with journals 22 in. × 40 in. The shaft is forged with solid half couplings at each end for coupling to the motor shafts, the couplings being fitted with cross keys to relieve the bolts of

couplings being fitted with cross keys to relieve the bolts of the shearing stresses.

The drum is fitted with two sets of post brakes, the brakes being capable of pulling up and holding at any point in the shaft a lowering load of 8 tons.

In addition to a hand-operated band brake, each flywheel is provided with an electromagnetic brake acting on the rim of the wheel and capable of bringing the converter set—with one flywheel—to rest from full speed in 8 minutes. The time taken by the same set to come to rest when running free is about one hour.

During the sinking period each winder was apparent of the same set.

During the sinking period each winder was operated by one motor, the drums being of 14 ft. diameter. The loads consisted of men, rubbish, building material, and water, the maximum unbalanced load being 8 tons.

On completion of the sinking to 750 yards, operation was continued with the 14 ft. perallel drum with one motor raising

On completion of the sinking to 750 yards, operation was continued with the 14-ft. parallel drum with one motor raising two trams of coal or rubbish.

Following the partial opening-out of the colliery, as the cylindro-conical drum could not be erected for some months, a balance rope has been fitted on the winder with the 14-ft. drum, thus enabling one motor to raise four trams of coal (6 tons). Working under these conditions with 19 winds per hour and a winding time of 80 seconds, the number of kilowatt-hours taken by the Ilgner set average over one hour is 3.7 per ton of coal wound.

On completion of the cylindro conical drums of the cylindro conical drums.

On completion of the cylindro-conical drum, when winding 390 tons of coal per hour, the input into the Ilgner set will be 1,360 units per hour, or 31 units per ton of coal wound from

730 yards.

(To be continued.)

### NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

#### Homonolith.

We have received from Mr. H. Slood, of 51, Anson Road, Cricklewood, N.W., a sample of "Homonolith." in which material his works are now prepared to supply all kinds of turned articles, polished or otherwise, at low prices. The substance is intended to replace "Galalith" in every way; the specimen is a black rod possessing considerable strength, and cutting like bone; when held in a fiame it burns with difficulty.

### Weights and Measures Computer.

An ingenious instrument has been devised by LIEUT. F. SEXTON-Snowdon, of 22, Henrietta Street, Covent Garden, W.C., to save labour and ensure accuracy in converting the value of goods offered in the currency and measures of one country into the equivalent value in terms of those of another country. The device equivalent value in terms of those of another country. The device resembles the familiar date indicator, and is provided with two handles, the rotation of which performs the desired operation. The range of the instrument is from \( \frac{1}{2} \)d. 10s. per lb., gallon or foot, but a variety of spools is being prepared to meet other requirements, the spools being interchangeable. All values are calculated to five places, on the basis of the average rates of exchange prevailing before the outbreak of war; but a table of corrections from 5 per cent. above to 5 per cent. below the basis figures is provided. Full particulars can be had from the inventor. inventor.

### "Witton" Field Regulators.

THE GENERAL ELECTRIC Co., LTD., of Witton, Birmingham, have designed a small type of rectangular regulator for use in exciter circuits. This regulator, which is shown in figs. 1 and 2, consists of two parallel lines of rectangular contacts mounted on a slate base, which is carried on a strong steel framework on which s also mounted the resistance, composed of special resistance wire

FIG. 1. -- "WITTON" REGULATOR FOR EXCITER CONTROL.

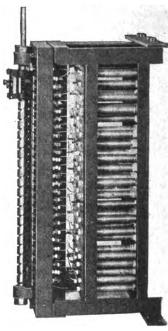

FIG. 2.—INTERIOR VIEW OF "WITTON" REGULATOR.

wound on asbestos tubes. These asbestos tubes are carried on steel supporting bars, which are bolted at both ends to the framework. The connections between the resistance wire and the contacts are solid, there being no loose wires; this follows on standard G.E.C practice for all their regulators and starters. The regulator illustrated was one of a number constructed for controlling the shunt current of the exciter for a 3,000-KW turbo-alternator

### Igranic Electric Vehicle Controllers.

Drum-type electric vehicle controllers are made by the IGRANIC ELECTRIC Co., of 147, Queen Victoria Street, E.C. The pressed steel frames used are very strong, but light in weight and easily mounted; all contacts are of ample capacity, and the total voltage drop across the controller is negligible. Contact rings are made of drawn copper. The fingers are of unique design, being pivoted and pressed into contact with the drum cylinder by helical compression springs. The renewable tips of the fingers are of drop-forged copper.

drop-forged copper.

This form of drum construction is one which has proved its excellence in electric crane and steel mill service. It is claimed that it is more robust, and can be operated with less effort, than

other types.

The controllers are so designed that transitions of field and battery connections are made by bridging, and therefore without interruption of motor torque.

The resistances supplied are of the cast-iron grid type, and can be supplied attached and connected to the controller, or separately,

Wherever necessary magnetic blow-outs are provided on controllers for the purpose of promptly extinguishing the arc.

Wherever a separate reversing switch is provided there are, of course, as many reverre as forward positions. Single lever controllers can be furnished either with or without a separate main switch. When a main switch is provided, it is so interlocked with the control drum as to prevent its being closed at any time except when the control lever is in the off position. Furthermore, when a main switch is provided it can be interconnected with the foot-operated brake in such a manner as to be moved to the open-circuit position whenever the brake is applied.

whenever the brake is applied.

Those controllers which have a separate reversing switch are provided with a cam mechanism adapted to be connected to the foot brake lever. This cam is so arranged that whenever the foot brake is applied the reversing switch is moved restricted to the reversing switch is moved positively to the open-circuit position, in which position it latches and cannot be released unless the control lever is thrown to the off or braking position. This reparated interlooked reversing switch can also be connected to an operating lever on the car, and thereby made to serve as a safety switch.

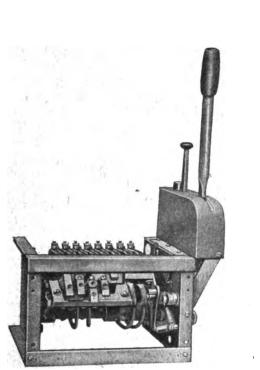

#### Extra Heating Surface for Lancashire Boilers.

In view of the deficient heating surface of Lancashire boilers, and the present high price of coal, users of such boilers should be interested in the Adamson-Davies patent tubular extension, which has been brought tubular extension, which has been brought to our notice by MESSES. J. P. DAVIES AND Co., of 39, Thornbury Road, Isleworth, Middlesex. The device is illustrated in fig. 5, and remembering the fate of the cross-tubes so much in vogue 20 years ago, at first sight one might be unfavourably disposed towards it; but it is worth careful consideration.

It will be noted that the extension consists of an element of a water-tube boiler having a heating surface about half that of the flue-tube in which it is fitted; thus

of the flue-tube in which it is fitted; thus the extension increases the total heating surface of a Lancashire boiler by 30 to 40 per cent., and being situated in the direct path of the hot gases, its effective value is still greater. The flue is not weakened by the attachment of the extension, and there is no difficulty in cleaning the flue and tubes, as a man can pass right through the flue from end to end. The boxes are not exposed to the hottest gases, and the tubes do not accumulate scale, as all sediment is deposited at the bottom of the boiler; but a brisk circulation is maintained, and steam can be raised quickly. The arrangement is obviously free from troubles due to expansion and contraction, and the tubes can be withdrawn through the furnace if required.

It is claimed for this system that it enables a saving in fuel of

Figs. 3 and 4.—Igranic Electric Vehicle Controllers.

Practically all electric vehicles are operated by means of series-wound motors which have their field windings in two sections. The controllers described are designed for use in connection with

motors of this type.

They are divided into two class They are divided into two classes—the first class comprising those controllers which accomplish speed control by means of armature resistance and series field commutation—the second those controllers which are adapted for the commutation of batteries, as well as field windings, the batteries on the car being divided into .two sections, and these two sections connected either in series or parallel relationship, depending upon the speed re-

quired.

Each of the two classes mentioned above can be further subdivided into those which secomplish forward and reverse control of the vehicle by means of one operating lever, and those which have a separate reversing

The controller is designed for mounting under the seat for left-hand operation. The safety switch is conveniently mounted just behind the speed control lever with which it

interlocks. Pulling up on this red cuts off the current independently of the control lever. It can only be re-closed when the control lever is in the neutral position.

The first class of controller mentioned is adapted for use on those cars whose maximum speed does not exceed 18 miles per hour, while the second class is adapted for machines operating above this speed, or for slow speed machines which may be called upon

this speed, or for slow speed machines which may be called upon to operate at greatly reduced speeds for considerable periods of time. The single voltage controllers for moderate speed vehicles provide five speeds forward; the connections are as follows:— Motor fields in series (1) two steps of resistance in circuit; (2) one step of resistance in circuit; (3) no resistance in circuit; (4) motor fields in parallel—no resistance in circuit; (5) motor fields

motor fields in parallel—no resistance in circuit; (b) motor fields in parallel, shunted—no resistance in circuit.

Double volvage controllers provide five speeds forward as follows:—(1) Fields in series—batteries in parallel. (2) Fields in parallel—batteries in parallel. (3) Fields in series—batteries in series. (4) Fields in parallel—batteries in series. (5) Fields in parallel, "hunted—batteries in series.

It should be noted that all five control points on double voltage

controllers are economical running positions, and that on no point are any material resistance losses sustained, as is the case with single voltage controllers.

Where controllers are adapted for forward and reverse operation by means of a single lever, three reverse positions are provided, these corresponding with positions one, "wo and three forward.

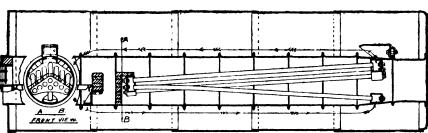

FIG. 5.—ABRANGEMENT OF BOILER EXTENSION.

10 to 20 per cent. to be effected, besides increasing the output per boiler, so that four boilers thus equipped will do the work of five without the extension, and tests are quoted showing an improvement of 25 per cent. in fuel consumption. As many as eight boilers belonging to one firm have been successively fitted with the device, as the result of experience of its working. existing boilers without difficulty. It can, of course, be fitted to

### Rotary Pumps.

One of the most recent additions to the world of pumps is a positive rotary pump made by the New ROTOPLUNGE PUMP Co., LTD., of 24, Broadway, Westminster, S.W. This pump incorporates a plunger action with a rotary motion, which may best be shown by the accompanying illustrations (p. 380).

The rotor, which is of steel or gun-metal, to suit the liquid the pump has to handle, revolves in a cast-iron case, with a close clearance. Arranged in the rotor is a set of cylinders, either four or six in number, set diametrically opposite each other. In these cylinders are placed the plungers—the two opposite plungers being coupled together, as shown in the views. Movement is given to these plungers, as the rotor revolves, by a steel block that the plungers is the rotor revolves. mounted on a pin, which is held in position by the end cover. pin is set on a different centre to the rotor, and causes the plungers continually to alter their relative positions in the cylinders, as the rotor rotates.

One of the chief merits of the pump is that it can be used equally as well on vacuum or air-compressor service as on water. It is further an ideal pump for crude sewage, on account of the complete absence of valves. There is only one stuffing-box, which is water-sealed, and one bearing, which is lubricated with an oilring. The pump being absolutely positive gives an output exactly proportional to the speed, and this is usually between 500 and 1,000 B.P.M. The piston speed of the pump is kept at about 150 to inside them; in the last case, they are made adjustable by a simple device, which enables the lamp to be fixed at exactly the right height to correspond with the design of the fitting as a scientific reflector, this being verified by a sighting hole in the reflector. We illustrate in figs. 7 and 8 one of the clip type and one

with the adjustment above-mentioned.

Whereas originally only four types of distribution were listed, there are now 10, each having definite characteristics, and the

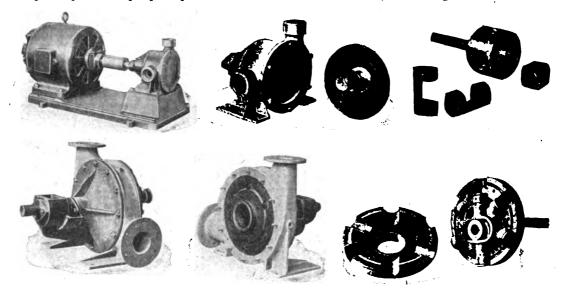

FIG. 6.—FOUR-CYLINDER AND SIX-CYLINDER ROTOPLUNGE PUMPS COMPLETE, AND IN PARTS.

250 ft. per minute, and the bearings are designed on an extremely liberal basis.

liberal basis.

The pump is constructed in sizes from in up to 24 in. bore, and for all pressures, and when working on a closed suction a vacuum within 25 in, of the barometer can easily be maintained.

As regards efficiencies, these nearly always equal, if not exceed, those of a pluoger pump for the same work, and the volumetric efficiencies are extremely high owing to the close clearances. A useful feature of the pump, in which it differs notably from a centrifugal pump, is that its output is simply proportional to its speed, and a high efficiency is maintained, whereas a centrifugal pump can only run with high efficiency under the particular conditions for which it is designed.

The cost of upkeep is low on account of the small number of

The cost of upkeep is low on account of the small number of parts, and accessibility is a strong feature, for by removal of the end cover, the whole pump is exposed, no pipe joints being removed

#### Mazdalux Reflectors.

THE BRITISH THOMSON-HOUSTON CO., LTD., of Mazla House, 77, Upper Thames Street, E.C., in 1912 introduced the "Mazdalux" metal reflectors, which then occupied three pages in one of their price lists. So successful have these industrial reflectors been, that the company has just issued price list No. 10,336, devoted entirely to them and the accessories used with them, and a few days ago we paid a visit to Mazda House to inspect the new

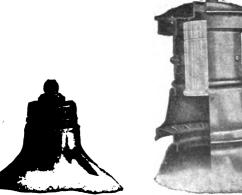

Fig. 7.-. 7.—CAP SPRUNG ON LAMP CAP.

FIG. 8.-ADJUSTABLE WEATHER-PROOF HOUSING (No. 08).

types and sizes of reflectors to which it relates--and which, we note, all are (and always have been) entirely British made. The range now covers standard Maz la lamps from 10 to 1,000 watts, and Maz la now covers standard Mazia lamps from 10 to 1,000 watts, and Mazia half-watt lamps from 100 to 1,500 watts. An ingenious system of classification, numbering and labelling has been adopted, which enables the complete description of every reflector to be conveyed by a single catalogue number, while the directions on the label are calculated to render erection a matter of the utmost simplicity. Special attention has been given to the new caps or housings which carry the reflectors proper; according to siz3, these fit, or spring on to, the usual B.C. holders, or grip the skirt of the lamp cap or in still larger sizes, carry the all-porcelain lampholder bearing of these upon the height and spacing of the lamps is explained, with useful hints on planning lighting installations, and a novel chart for the same purpose. Besides various bowl patterns, there are many "angle" types for asymmetrical distri-

-Mazdalux Bowl REFLECTOR FOR NARY LAMP. ORDI-

FIG. 10.—REFLECTOR FOR HALF-WATT LAMP, 15° ANGLE TYPE.

bution, and we illustrate one of each of these groups in figs. 9 and 10, while fig. 11 shows a special lock-up "local" type with a wire cage to prevent the unauthorised removal of the lamp or reflector.

FIG. 11.—SPECIAL LOCAL TYPE.

The reflectors are of enamelled steel or aluminium, with mattaluminium reflecting surface, or steel with white vitreous enamel inside and outside.

The list contains much information, and will be found useful in many respects.

Roller Bearings.-Messrs. Broom & Wade, Ltd., have just completed delivery of some 200 3-in. Hyatt roller bearings to the Associated Equipment Co. for the line shafting in their new works, which is being entirely equipped with them.

### THE SELLING SIDE OF ELECTRICITY STIPPLY.-I.

### SHOWROOM WINDOWS.

In the selling scheme of the supply of electricity the showrooms play a very important part; this is so for the reason that much educational work has always to be done in familiarising the public with electrical appliances. One would never be very sanguine about selling an electric cooker, or even a toaster for that matter, purely by advertising and distributing literature in the district served. This part of publicity work has its value, but in itself can do little beyond the preliminary ground work. Mr. "Consumer" wants to see the apparatus, what it looks like, how it works, and it is necessary therefore to have a showroom containing an exhibit of electrical goods for his inspection. There are many of these showrooms springing up now, and judging by the general arrangement, selection, and show of goods, it is evident that a few hints will not be out of place from one who has had extensive experience in showroom management. I have recently seen several of these showrooms which, to my mind, have completely failed in several of the details essential to their success.

One of these showrooms (a London one), as far as I could see, had not had the slightest alteration in the window display since my last visit to the locality, several months before. So much has been written on the subject of window display, and the importance of frequent changes, that anything further would have seemed superfluous without the evidence of one's eyes to the contrary.

Any man in charge of a showroom should pay frequent visits to the best shopping centres. If he is observant he will notice that the most successful shops in almost any line of business have the most attractive windows; he will further find that these windows are always being changed. There is no finality in window display; they must be dressed and re-dressed. The idea to be kept in mind is to let nobody get into the habit of passing your shop without glancing in. A hint might well be taken from the best-dressed windows in the West End of London; they are for ever changing, and if this is considered worth while in such a thoroughfare, say, as Oxford Street, which is always thronged with shoppers and sight-seers, how much more important it must be to alter the display in a less frequented part so that a glance or a visit may be secured from every likely consumer? Energy is an essential quality for a showroom manager, and he must never be tired of making alterations. It must be kept in view that to display appliances and apparatus tending to extend the revenue from existing services without entailing fresh capital outlay is one of the first objects of a supply undertaking showroom. Therefore irons, kettles, toasters, radiators, cookers, and all the long list of "other uses" should be kept well to the fore. Nothing should be easier than to make an attractive display with these things. We have the public interested in electricity to start with.

is an art in itself. It will make our task of constant change easier if we make a point of "featuring," as our American friends put it, some special article each time. It also carries a stronger impression to show a group of appliances of the same kind than a dozen oddments. Then these should not be left to speak for themselves. Attractive showcards take a high place in any selling scheme. What the appliance is for; what it costs to buy; what electricity it uses; how to use it; where to use it, etc., etc. The showroom windows should not be crowded with articles, and

Think of the difficulty of breaking the monotony of a shop window displaying sewing machines or, in fact, any one-line business. Yet it is done, and it

the goods themselves should be kept clean, as well as the windows and fitments. This may appear obvious enough, but it is a remark that is called for. Nickel-plated goods should really be kept in special cases similar to those used by jewellers; it is the only way to keep them in a saleable condition. If shown in an open window they must be frequently cleaned; in the dull state which they assume after a few hours in an exposed atmosphere they are more likely to repel people than to attract them. Something in motion is a draw-even the old dodge of a silk ribbon blown out by a fan can be made effective; one way is to fasten one end to the fan-guard and the other end to an iron or some other appliance upon which you wish attention focused.

In displaying toasters, for example, a fresh piece of toast should be made once or twice a day and placed in the rack; show everything as far as is possible performing the function for which it is designed. There are many ways of doing this, and we are going to help by making suggestions in these

columns from time to time.

#### CORRESPONDENCE.

Letters received by us after 5 PM. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

#### Coke Fuel for Steam Raising.

In the interests of my Committee may I be allowed to correct

In the interests of my Committee may I be allowed to correct an impression which might be conveyed by the remarks made in reference to the above subject by Mr. Horace Boot, as reported in your last issue, at the annual meeting of the South Metropolitan Electric Light and Power Co., Ltd.

In discussing the policy of the company in adopting coke fuel for steam raising, and the favourable report of Mr. H. W. Bowden, the engineer-in-chief, on his experiments in this direction, Mr. Boot is reported to have said that the price of coke breeze had risen from 6s. to 8s. per ton, and that in his experience the use of this fuel would have reduced by half the life of certain steam boilers with which he had experimented. It would be interesting to many users of this class of fuel to know the precise conditions of Mr. Boot's experiments, as it is within the knowledge of a large number of engineers that steam boilers of most types common to this country are operating satisfactorily on coke breeze, and also that there are many instances where no other class of fuel has been used; and this without the baneful results indicated, and without adverse comment being received from inspectors employed

without adverse comment bing received from inspectors employed by the leading Boiler Insurance Companies.

One concrete instance may be given which will be appreciated by engineers responsible for the maintenance of boiler plant operating on coal slack containing the usual proportion of volation. committee on Coal Smake containing the usual proportion of volutile sulphur. In evidence recently given before the Departmental Committee on Coal Smoke Abatement, Mr. Edward Allen, chief engineer of the Liverpool Gas Co., stated that in his experience Baboook water-tube boilers had been fired with coke fuel over a period of 15 years without the necessity arising of renewing a single tube. single tube.

Similar experience with most types of boilers at colliery, coke-oven and other works where the use of raw coal is not permitted (and where boiler capacity is not an unimportant consideration) could be quoted ad infinitum. These boilers are almost invariably operated under impelled-draught conditions at their full normal

capacity.

The increase in price reported by Mr. Boot is entirely due to conditions brought about by the war, and, unfortunately, is common to all classes of solid fuel and to a greater extent in the case of coal; but even at the higher figure indicated, coke breeze is still the best fuel value at present obtainable in London. Makers of furnace apparatus will guarantee an evaporation of 6 lb. of water per pound of breeze and rates of combustion exceeding 30 lb. per sq. foot of grate per hour have been maintained with automatic mechanical stokers of the underfeed travelling-grate type, illustrated and described in the Journal of Gas Lighting, July 25th, 1914.

Mr. Bowden is probably correct in stating that his is the first

Mr. Bowden is probably correct in stating that his is the first power-house stoking-equipment specially installed in this country to use coke breeze exclusively, and his achievement in continuous operation is certainly unique; but many of the more up-to-date power stations, whose stoking appliances do not restrict them to the use of one uniform class of coal, are now using coke breeze extensively, while others are using coke to the total exclusion of all other solid fuel for steam-raising, thus realising considerable commercial advantage in addition to the practical advantage of smokeless combustion. smokeless combustion

As a matter of local interest it may be worthy of note that coke is now produced in the London district to the extent of over 2 million tons annually. In normal circumstances, a considerable

roportion of this output is exported at a price considerably below that at which coal of equal evaporative value can be bought in

Westminster, March 9th, 1915.

### "Totally Enclosed" Motors.

I have for a number of years been a subscriber to the ELECTRICAL REVIEW, and have from time to time read with special interest some of the correspondence on various subjects which has

appeared in your columns.

appeared in your columns.

As this correspondence is undoubtedly perused by both manufacturers of electrical machinery and manufacturers' representatives who are more or less responsible for the negotiations for the sale of such plant, it occurred to me that some of those interested might be able to enlighten me, and also several others with whom I have spoken on the matter, as to what really constitutes the total enclosing of an ordinary industrial electromotor.

From experience in dealing with prospective buyers and users of electric motors for certain applications, it seems that the term "totally enclosed" is construed by the layman in its literal sense, and is generally understood by him to mean "absolutely enclosed"

to the exclusion of dust and any foreign matter that may be floating about in the surrounding atmosphere.

Manufacturers, on the other hand, do not appear to recognise this interpretation of the term as being the correct one. Their this interpretation of the term as being the correct one. Their definition of totally enclosing appears to imply nothing more than a solid cover enveloping the whole of the working electrical parts of the machine, rendering them quite inaccessible to either attention or inspection, except by removing portions of the casing which are designed for the purpose.

Probably there may be other commercial engineers who have experienced the difficulty of persuading a prospective customer that a totally enclosed machine which it might reasonably be assumed to be, and no doubt a more detailed definition of such motors than the writer has yet found, will be very acceptable.

doubt a more detailed definition of such motors than the writer has yet found, will be very acceptable.

I should be obliged if any of your readers could refer me to any authoritative definition which clearly states the features of totally enclosed, or totally enclosed pipe-ventilated, motors, without ambiguity.

London, E.C., March 9th, 1915.

### Trouble with Oil.

In response to "Inquirer" re the above trouble, one could have desired a little more information than is given. As the "shaft is quite dry," this can be eliminated at once. Now, as the engine must run with all casing and bed-plate doors in position, the only other place to exude oil is the bare expanse of piston-rods. If, as I suspect, the engine is using highly superheated steam, the HP. rod will be found to give off a thick blue vapour. This is (usually) only visible on a day on which the sun shines through the windows, and then in its beams the blue vapour is clearly discernible, and it will be found to proceed from the source indicated. As to its ourney to the inside of the dynamo, is there any window or ventilator which would assist it towards the machine end? If so, this should be stopped immediately, and a good fan installed in a high position to clear the atmosphere. Finally, if found absolutely necessary, the aperture in the guide giving access to the HP. packing gland and scrapers may be covered in back and front by sheet metal doors. This, however, is not without its drawbacks for the drivers, who prefer an open space in order that an eye may be kept open for "hot rods" and any "swabbing" done if required. In any case, only the H.P. rod need be treated thus.

Triple-Expansion. In response to "Inquirer" re the above trouble, one could have

Triple-Expansion.

Walbrook.

### Salaries of Engineers.

Herewith I am forwarding you cutting (see below) from the ELECTRICAL REVIEW Supplement, page 16, November 13th, 1914, appearing under the heading "Situations Vacant":—

VACANCY for young engineer to act as Works Superintendent.

Must have following qualifications:—First-class technical education in mechanical and electrical engineering, and some knowledge of elementary chemistry. Two years' practical experience in power station running and repairs. Some knowledge of draughts-manship and drawing office work. Experience in gas works and gas analysis desirable. Salary, £120 per annum.—1063, ELECTRICAL REVIEW, 4, Ludgate Hill, London.

On reading the advertisement referred to above, I notice the salary is £120 per annum; should this not read £1,200? Surely

the former amount must be a misprint.

Provided £120 is the correct amount which is offered for a man with such colossal qualifications, and is a fair criterion of what is offering in the way of salary at home at the present time, then all I am able to say is that I am not returning to England until the market price has advanced somewhat.

Doubtful.

Sydney, January 16th, 1915.

for labour, but a brklayer can obtain his £200 a year to say the very least of it.

Trade Routes to Russia.

In the "War Items" of the current issue of the ELECTRICAL REVIEW you reprint an extract from an American report which has just been issued. It is quite evident that his report when not contain such up-to-date information as reports emanating from America usually do. Moreover, there are several quite misleading pieces of information, and I would strongly advise your English readers to take no notice of it.

With the exception of very urgent war material, and little even of that, practically no ordinary commercial goods have been going via the railway to Vologda for months past. One method has been via the railway to Vologda for months past. One method has been to send goods via the Dvina, thence juining the railway from Perm, or, what was lately done, to send the goods on sleighs at a cost of about £18 per ton. Although this amount seems an enormous one for carriage, yet on high-priced goods, such as expensive machinery or valuable metals, it is of little account. I should not advise any of your readers to depend of the Archangel route, even

advise any of your readers to depend on the Archangei route, even when the port is open, say, by the end of May.

I do not understand what the reporter intends to convey by the expression: "New interest is being taken in the all-rail route from eastern Scotland or England," &c. He seems to have discovered a new route, because I can hardly imagine anyone having the alightest knowledge of the subject being so stupid as to send goods "A Bargen. Christiania and Stockholm to Tornea. There is a singlesst and steam and Stockholm to Tornea. There is direct route from Trondjhem, and still a better one from Narvik across the upper part of Norway and Sweden, and the Narvik to Tornea route is probably less than one-fifth the distance, and consequently almost proportionately less in cost than the imaginary route outlined by the gaseous reporter. If one examines the map of Norway and Sweden one will see how cleverly worked out the reporter's scheme is to mislead the English manufacturer and merchant. No doubt the reporter had in his mind the more expeditious and cheaper route, such as Trondjhem or Narvik, but this,

of course, is for his own country's good, and there may possibly be found a supplementary report for American consumption only.

I had the pleasure of travelling over the route suggested by your imaginative reporter, which, I may add, is the route usually taken by human freight, and I found the railway connecting the taken by human freight, and I found the railway connecting the gap had already been completed some two or three weeks, consequently one can affirm that the route has been completed, say, eight weeks. The journey from Petrograd to Stockholm, even when the connecting railway was not completed, only occupied three days, but probably the reporter, or the man he met, would require more time for thinking out these wonderful new schemes than the supply of correct and reliable information to his British friends. I sincerely trust that this route will offer attractions for the shipment of American freight of any kind to Russia.

I am glad to see that the report as a whole bears the same imprint of excellence as do usually all such American reports.

Traveller.

March 5th, 1915.

#### Japan-China Cable.

Our attention has been drawn to the notice appearing on page 252 of your issue of the 19th ult. relative to the cable connection between China and Japan, which does not give a correct statement of affairs.

As a matter of fact, this company has not parted with any of its cables between the countries in question. It may also be added that the company has a perpetual right to work its cables from Nagasaki, in Japan, connecting the latter place with Viadivostock,

Apart from this, the Japanese Government, under an arrangement with the authorities concerned, has laid a cable between Shanghai and Nagasaki. This cable, which is worked by Japanese Government offices at both ends, is, however, only available for Government telegrams and Shanghai terminal telegrams written in Japanese characters and so called keep

in Japanese characters, and so-called kana.

I should feel obliged if you would cause a correction to the above effect to be inserted in the next issue of the ELECTRICAL REVIEW.

The Great Northern Telegraph Company's Representative in England. London, E.C., March 5th, 1915.

### Consulting "Engineers,"

May I ask for some further information on this subject?

1. Does "Delta" object to a man's obtaining his engineering training while manufacturing artificial teeth? (p. 212, February 12th.)

2. Or, did he mean that a particular man has less training than himself and more push? He asserts the training was obtained.

3. Is "Station Engineer" correct in asserting that "imprison-

ment or heavy fine immediately follows an individual who attempts to practise as a lawyer or medical man without first qualifying"?

to practise as a lawyer or medical man without first qualifying"? My belief is that he is quite wrong, so long as there is no misrepresentation. I do not promise unqualified men much work!

4. If "A M.I.E.E. and M.I.M.E. sound ridiculous and foolish," does "Station Engineer" aspire to a B.Sc. or M.E. or something better? (p. 270).

5. Does "Alpha" do any serious work and pay fees to the type of consulting engineer he "prefers" ("one who knows nothing, shuts his mouth, and leaves himself in the hands of a few good firms")? (p. 307, February 26th).

6. What do the firms do?

7. How many consulting engineers has he paid fees to (both capable and incapable)?

8. Has "Alpha" followed "Delta's" advice to "look more closely into the qualifications of those to whom they entrust their work"?

9. Did "Alpha's" consultant get the blow in the back "after the term of maintenance" and from whom?

10. Do not incapable men find their own level in whatever activity they attempt to follow?

Theodore Stevens.

London, E.C., March 2nd, 1915.

#### Writer's Cramp.

In reply to "W. H. B." in "Medical Electricity," by Dr. Lewis Jones, sixth edition, there is the following:

"The results of electrical treatment are unsatisfactory. Max Weiss recommends the use of constant currents of from two to five or eight milliamperes, with absolute rest from writing. Further particulars are given."

Great relief will be obtained by using the thick cork "anti-cramp" pen-holder, which avoids that undue approximation of the thumb and fingers which produces writer's cramp.

Another W. H. B.

In reply to your correspondent "W. H. B.," as one who during many years has come across, from time to time, various medical applications of electricity, I feel it a duty to give a word of warning to this effect: that the results of promiscuous use of apparatus without advice from a really well qualified medical specialist in the particular ailment it is applied for, may be either good, bad or indifferent, and it is difficult to say which is most likely. The obvious moral is, get such advice, if possible; such specialists generally prescribe for a definite system of hospital treatment in milliamperes and minutes.

Vibro-massage, however, can scarcely do any harm, and might be tried, if available.

tried, if available.

Whatever system of relief is tried, it is, of course, greatly helped by strict regimen as to diet, outdoor exercise, and avoidance of irritants and debilitants, such as alcoholic liquors and tobacco. Please pardon the mention of the latter. I would not do it, but am sure in some cases of nervous disease (and, of course, hand trembling is a nervous disease), it gives steadiness for the time, the effect having to be paid back at a high rate of interest.

A. W. B.

March 8th, 1915.

### THE RÖNTGEN SOCIETY.

At the March meeting of the Röntgen Society, held at the Institution of Electrical Engineers on the 2nd inst., a paper was read by Mr. Alexander Fleck, B.Sc., of Glasgow University, on "The Chemistry of the Radio-elements." Mr. Fleck supported in the main Professor Rutherford's conception of the atom, which, he said, was the only one commending itself the atom, which, he said, was the only one commending itself to the mind of the chemist, namely, that the atom consisted of a central nucleus surrounded by rings of electrons, and that it was a positive charge of electricity within the atom, together with the structure of the nucleus, which determined the properties of a given element and gave it its place in the periodic table. In the central ring of electrons the gamma rays had their origin, being produced by the passage of beta particles through the ring. Incidentally Mr. Fleck said that recent generalisations in connection with the periodic law had made it evident for the first time that positive and negative electricity each had a real existence. Previous to these researches upon the structure of the atom, he was not aware that there was any evidence which made it quite plain that positive and negative electricity were two separate and distinct things. So far as they knew until these investigations, positive electricity might only have meant the absence of preparative but the great work ways the limit the absence of negative, but this recent work upon the disintegration of the radio-elements showed that within the atom there was posi-tive and also negative electricity, and that the atomic charge in the nucleus was in reality not a positive charge, but was the

in the nucleus was in reality not a positive charge, but was the difference between the positive and the negative.

Mr. J. H. Gardiner pointed out that the actual atoms of which an element was composed were probably not all identical, but differed among themselves, and that what they knew of the properties of an element was simply what they knew of the properties of the mass of these atoms. Lead, for instance, had an atomic weight of 207.1, but this did not mean that every atom of lead had that atomic weight.

Professor Nicholson entered into the question whether a difference in atomic weight should be denoted by a difference

in the spectrum of a given element, and on the kinematical in the spectrum of a given element, and on the kinematical theory of the origin of spectra he considered that it should. He believed the inner ring of electrons within the atom to be a mathematical impossibility; the only kind of structure they could have in the atom, over and above several outer rings, was nuclear structure, and must be regarded as beta particles which had not yet been born.

Professor A. W. Porter, who occupied the chair, considered that the new arrangement of the radio-elements, resulting in the changing of the periodic law from something entirely

the changing of the periodic law from something entirely empirical to an orderly sequence, was the most important generalisation made since Mendeléeff, and, indeed, completed

the work which Mendeleeff began.

### FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

CANADA.—From February 12th the following provisional increases have been made in the tariff rates:—The general and intermediate tariff rates are increased by 7½ per cent. ad valorem, and the British preferential rates by 5 per cent. The general tariff is applicable to goods the produce of countries which have no special treaty with Canada, and the intermediate tariff is applicable to certain specified goods the produce of countries having such treaties. Articles formerly in the free list are made dutiable at 7½ per cent. ad valorem under the general and intermediate tariff rates, and at 5 per cent. under the British preferential tariff rates. There is a considerable list of exemptions. Other revenue measures include under the general and intermediate tariff rates, and at 5 per cent. under the British preferential tariff rates. There is a considerable list of exceptions. Other revenue measures include a 1 per cent. tax on bank-note circulation and the gross income of loan and trust companies and insurance companies' premiums other than life, marine, and benefit insurance; taxes on cable and telegraph messages, steamboat and railway tickets, stamp taxes on cheques, bills of exchange, bills of lading, letters, patent medicines and wines.

GERMANY.—The following statement by the American Consul-General in Berlin regarding the administration of the German tariff since the war, which has just been published by the American Government, will be of interest to manufacturers and traders in this country:—

The war has completely altered the status of trade agreements and customs treaties existing between the German Empire and the nations at war with Germany. It was naturally to be expected that the declaration of war should terminate the status of trade agreements and customs at war with Germany. It was naturally to be expected that the declaration of war should terminate the status of trade agreements. ally to be expected that the declaration of war should terminate the peace treaties negotiated at Frankfort and the German trade agreements with Russia, Belgium, Serbia, Montenegro, and Japan. It also naturally follows that the customs treaties by which certain advantages were given on the products of these nations by the German Government should be no longer valid. Furthermore, it was to be expected that the advantages as to duty, which were granted by the provisions of the German-English trade agreement to all the States of the British Empire, would be withdrawn.

The changes in the treaty agreements above mentioned have brought about many intricate and difficult questions, some of which have not yet been settled. It was necessary to give German buyers who had purchased goods before the war commenced an opportunity to enter their goods at the customhouses on an equitable basis, otherwise great injustice would be done these buyers, because it was not possible for them to calculate upon such a sudden and important change in German descriptions.

calculate upon such a sudden and important change in Germany's commercial relations. These exceptions have been made necessary largely because the condition of war would cause a higher rate of duty to be placed upon goods which were shipped from a country enjoying unusual duty and trade

advantages.

A study of the conventional and general tariff system of Germany shows that certain industrial and manufactured pro-ducts, to which the rates of the general tariff are not entirely applicable, would be particularly affected because the special concessions granted by tariff treaties to other countries would be superseded and disarranged. Certain old and established industries have thus been caused considerable difficulty be-cause they were used to the tariff rates formerly in force and were not in a position to adapt themselves to the unforeseen changes caused by the war.

It was obvious that the immediate application of the higher

rates of duty after the outbreak of war was exceedingly satisfactory to certain German industries interested in the domestic production of manufactured goods. Certain industries will undoubtedly benefit by the exclusion of the goods of countries at war with Germany, and these industries will establish them-selves during the course of the war in such a way that they will not be easily stamped out when the war is terminated and the usual customs arrangements prevail. In support of this view the war of 1870 is cited, during the course of which the

aniline-colour industry made great progress.

Although, strictly speaking, the relations of Germany with respect to the most-favoured-nation clause have been disarranged by the war, an effort has been made to keep the advantages granted to friendly and favoured nations in force until satisfactory arrangements can be made and mutually until satisfactory arrangements can be made and mutually

beneficial decisions reached.

South Africa. - MUNICIPAL POWER SCHEMES. - On the recommendation of the Electrical Trade Section of the Johannesburg Chamber of Commerce, a communication has been addressed to the Administrator, Cape Province, calling attention to the fact that in recent cases of inquiries for tenders for power schemes connected with municipalities in the Cape Province, it has been found that the conditions imposed on contractors were so onerous that firms were unable to submit tenders. The principal reason that firms were unable to submit tenders. The principal reason was that the consulting engineer reserved to himself such excessive powers, that if firms had tendered they would have been compelled powers, that if firms had tendered they would have been compelled to provide a considerable sum for possible contingencies. The Committee submitted that it was most desirable that the conditions attaching to these schemes should be such as firms could comply with—for, in the cases in question, even had the firms concerned tendered, their prices would of necessity have been higher than would be the case if reasonable conditions were laid down. It was evident that in the circumstances (and particularly by reason of the absence of due competition) public interests suffered. The Administrator was, therefore, asked to authorise the Government electrical engineer to confer with a deputation from the Chamber of Commerce in order to discuss the difficulties which had arisen.—S.A. Mining Journal. -S.A. Mining Journal.

Municipal Employés' Sick Pay.—At Accrington Town Council, last week, Ald. Higham explained, in answer to a question, Council, last week, Ald. Higham explained, in answer to a question, that a young man employed on the switchboard at the electricity works was taken ill in July last. It had been the custom in some departments to pay men full wages for a short period and partial wages for another short period. Month by month this salary had been paid, and the young man in question had been receiving, in addition to his wages, his insurance money also. As near as he could tell, he had received £11 in excess of what he had been entitled to. From January to the end of last week the young man had worked off the surplus money and had now secreted another. had worked off the surplus money, and had now secured another position.

#### INDUSTRIAL ORGANISATION.

WAR is a solvent of social order which peace will recrystallise into new forms, better or worse. In the unsettling of old habits and prejudices, in the fluidity of general ideas under the intense action of prolonged national crisis, is seen an occasion for recasting much that is imper-The liquor traffic, the housing of the poor, the relations of workers to their employers, the morals of great cities, physical training of young men, national education, the political subjection of women; all such questions come into clearer light. We can regard them from a higher and more detached standpoint, in more sober and serious temper, under the stress of a great conflict.

Of all these questions, the problems of industrial organisation, the organisation by which men and women earn their livelihood, and the means to lead their lives, nobly or basely as it may be, are paramount in importance, and industrial organisation in its widest sense includes all home politics, and much of foreign. Some of its most difficult questions now call for immediate solution. Solutions of great problems adopted in urgent need, and under instant pressure are apt to be more successful than those adopted deliberately, for the reason that the urgency rules out narrow and sordid considerations that compromise principle and emasculate legislation. Heroic occasion is the opportunity for heroic action. We have seen national drunkenness abolished from Russia at a stroke. In France every man turned almost at an instant to meet the peril of German domination. Our immediate danger is not so pressing as theirs, but it is more serious than we realise. Our leaders warn, advise, exhort us; but they do not take us into their confidence, and it is not good to treat us as children. Now we have industrial experiment before us on the great scale in several directions. The nationalisation of the railways, whether permanent or not, is a working fact. British Dyes, Limited, is under discussion, and letters upon the proposal from Sir William Ramsay and Sir Henry Roscoe, in the Times of March 10th, call for most serious consideration. Indeed, in our view the whole scheme, as we understand it, should be recast in the light of those letters, on the ground that bodies of men elected to directorates under the Companies' Acts do, as a matter of experience, depress the scientific interests of their concerns.

To many it appears that the production of dyes should be initiated as a national concern, and protected by prohibition of competing imports. It might well be transferred to an independent body subsequently. The immediate occasion of this article is the proposal of the Government to administer the engineering works of the country in the military interests of the Allies. Elementary considerations of efficiency would indicate such a course, but the fact that the relations of the employers and the men are such that the national safety is compromised by a conflict of sordid

[885]

interests makes the step necessary. Indeed, the condition of things recalls the faction fights in Jerusalem when the army of Titus was hammering at the gates. Though occasioned by military necessity, this assumption of the engineering works by the Government may have great consequences as an object lesson in Socialism, and it is fortunate that in the nature of things the arrangement cannot be permanent, so that its action can be watched disinterestedly as if it were only an experiment in State Socialism.

It is impossible to be satisfied with regarding the relation between an employer and a workman as a mere case of supply and demand: for from such a view it follows logically that the employer's interest lies in the workman being as dependent on him as is consistent with working efficiency, and that it is to the workman's interest to keep the employer continually anxious lest his men in a body and without notice should refuse to execute his contracts. A constant state of strain is inevitable. We do not suggest that this view of the industrial relation holds in all or many concerns, but it holds in some of great importance, and, in some degree, in many others. On the other hand, there are wellknown large firms in which the human factor is conspicuous in the industrial relationship, and some such concerns are the nearest approach to, are the best models of, the ideal state, that we can call to mind. If this semi-Socialistic step of the Government in taking over the engineering works throws light on this perplexing problem, the war will have that at least to its credit.

The imperative demands that the nation and our Allies are compelled to make upon all connected with manufacturing operations in England were expressed by Lord Kitchener in the House of Lords on Monday. It seems almost incredible that while our sons and brothers are fighting for our existence and sacrificing their lives, there should be amongst us any who are slackers. Successful operations cannot be carried through without abundant and continuous supplies of arms, ammunition and equipment, and we cannot feel that the appeal from the blood-soaked battlefield will fall on deaf ears. The need is so urgent that there ought to be no hampering of manufacturing operations by drink, ca' canny policy, or output restriction by Trade Unions.

The patriotism of the great majority of the workers will undoubtedly be on the side of Lord Kitchener and the Government if short shrift be given to those who prevent our factories from running at their biggest possible capacity. Everybody must be ashamed of men—they are not worthy of the name of Englishmen—who, when the need is so great, will take advantage of higher wages for idling for two days out of the six, and so letting their own kith and kin, fighters for Freedom and Righteonsness, who are driving back our Common Enemy, run the risk of being denied, at critical moments, the necessary support from the forces training at home because ammunition and equipment are not forthcoming freely enough.

While this interesting experiment in internal organisation is being undertaken, we are informed of a no less interesting one in business organisation. We have received from the Secretary of a Committee of the Engineers' Club at Manchester a copy of a report, drawn up for discussion, which recommends the establishment of an association of manufac

turing engineers for promoting their foreign trade. work is designed on a large scale, £300,000 a year is the expenditure suggested, and, so far as one can judge from a mere outline, the scheme is well conceived, though we think it is open to criticism on some points. For instance, it is proposed to reform the Consular service "by making the service a special medium for the furtherance of British commercial interests." The relations of our Foreign Office with other Governments, especially with those of dependent States, are often delicate, and depend largely, we believe, on our being disinterested in money matters. These relations might be seriously compromised if the Consuls themselves took an active part in seeking remunerative business for their own merchants. Yet something will undoubtedly have to be done towards removing the inefficiences of the present Consular report service. Whether by the appointment of more Commercial Attaches, Trade Commissioners, or other specialised representatives, matters little, so long as the Government, following consistently its Trade War policy, remedies present shortcomings. We should be sorry to see our Government doing some of the things to which the German Emperor has condescended. enough to say that the less the proposed association depends on the Government, and the more firmly it stands on its own feet, the better for it. The weak point of the proposal may be a difficulty in finding the necessary subscriptions. Unless all firms make a pro rata contribution we should doubt the permanency of the arrangement, and firms whose trade is wholly a home trade might well refuse. The alternative to voluntary association, if the foreign trade is to be properly pushed, is said to be the formation of combines or trusts, and this the Committee very properly deprecates.

But if we rule out Government action and the formation of large controlling interests, we have ruled out two of the particular methods by which the Germans built up their foreign trade so rapidly. Other methods on which Germany relied, preferential railway rates at home, and arrangements by which the shipping companies were content to run ships at a loss, looking for their profit by the development of new German business in the future, do not seem to be possible in our case. The thing ought to be done in some shape. We are tempted to think that a trading association, on financial lines, looking for a trading profit, instead of relying on voluntary contributions, would be a more promising method.

For very many years we have Municipal endeavoured | to induce municipalities Finance. that conduct electricity supply and tramway undertakings to proceed on sound and conservative lines, accumulating substantial reserve funds and making ample provision for obsolescence and renewal of their plant; for this reason we have deprecated the allocation of surplus revenue to the relief of the local rates, a process which is usually based upon political motives and is intimately associated with the propensity for vote-catching, which is so deleterious to any form of government. Those who have followed our advice, and now find themselves in possession of up-to-date plant backed up by a large reserve, are to be congratulated on their foresight and good judgment; those, on the other hand, that have squandered their

receipts in sops to ratepayers and relied upon raising new loans to meet future needs may now realise the error into which they have fallen, for it is clear that the Government will not allow large sums of money to be borrowed for the purposes of municipal undertakings during the war.

As we are now approaching the period when most electrical undertakings close their financial year, a warning regarding the disposal of surplus moneys will be timely; we strongly urge all such authorities to retain full control of their funds, and absolutely to decline to permit them to be diverted from the service of their undertakings on any consideration whatever.

No one knows how long the war may last, or what the state of public finances may be for years after its close, and it is most important that undertakings which now have to depend upon their own resources should husband them most carefully.

Electric Cooking: From "A" Consumer's

It is a good many years since the electric cooker in its embryo state made its appearance with little more than a laboratory reputation and a stiff price to Point of View. recommend it. In the interval great strides have been made not only in the

design of suitable apparatus but also in its use, so that in many cases electric cooking has proved a commercially successful proposition.

This progress in recent times has been largely due to the efforts of the Point Five Association, whose practical methods of dealing with an admittedly difficult problem have more than anything else resulted in placing the electric cooker where it is to-day—in the hands of many consumers. That it is in this position, and is being increasingly sought after, is, after all, the best indication of what consumers think of it, and this fact discounts to a very large extent the impression which is bound to be conveyed to the uninformed reader of, Mr. Cooper's paper on this subject before the Institution of Electrical Engineers last week.

It is unfortunate that the author should -chosen to play the part of an investigator of electrical -cooking methods, and still more unfortunate that he should have thought it necessary to place his experience on record, as he might have known that his results had been bettered in everyday practice by users all over the country. The average consumer is fortunately not an engineer; his installation is selected and fixed under expert guidance, with due regard to first and subsequent costs; and if his anticipations are not realised or his results such as do not compare favourably with those obtained elsewhere, which he is fully entitled to expect, then in nine cases out of ten there is trouble for someone until the matter has been put right.

The fact that Mr. Cooper apparently did not follow this course differentiates him from the ordinary type of consumer, and, of course, detracts from the value of the paper, which was supposedly written from the consumer's point of view. Under the circumstances it is not surprising that the author was practically "snowed under" in the discussion, or rather, we should say, the reply, which followed the reading of his paper, and is published elsewhere in this

It is worth noting that one speaker pointed out that had the author lived in his area (in London) he could have had the requisite installation for a rental of 5s. or 7s. 6d. per quarter, and would have had the utensils supplied free, or, as a purchaser, he could have obtained the equipment installed and wired for use for £14, instead of paying as he did £35. Again, the consumption of energy in such a case as the author's was placed by experience at 3,500 units per annum, but the author's "careful" cook succeeded in disposing of over 5,000 units in the year. Moreover, his allocation of cost as between years with and without electric cooking seems to call for some explanation, in view of the result, which differs so widely from that mentioned by another member, who, during the past five years, has abandoned gas at 1s. 9d. per 1,000 cb. ft. in favour of electricity at the comparatively high price of 1½d. per unit for electric cooking purposes, and yet cannot from a comparison of the combined annual costs of coal, gas and electricity over those five years, find sufficient difference in cost to indicate when he changed over.

Mr. Cooper's references to load factor and diversity factor are not easily understandable; if the cooking consumers are regarded as a class, too much stress should not be laid on individual characteristics, as their combined effect alone will determine their value to the station. It is quite conceivable that a consumer with a large installation and a partiality for week-ends might have a very poor average load factor, while certainly the collective load of the small consumers who will enormously outnumber the large ones is a much more acceptable and profitable one to the central station. In fact, viewed from the standpoint of the future the socalled large cooking consumer could very well be dispensed with.

Mr. Cooper's paper forms one of the very strongest arguments we can have as to the necessity for electricity works to be in a position to advise and to hire out standard cooking equipments to consumers, and to keep in close touch with them afterwards, exactly as our gas friends have done

for years.
With all due respect to Mr. Wordingham, who, in the course of the discussion, referred to our leader of February 12th on the question of standardising electric cooking apparatus, we feel that this is a matter which goes somewhat beyond the scope of the sub-committee of which he is a member, and which is apparently inclined to let the matter rest because the manufacturers cannot make up their minds to co-operate in the movement. If electric cooking is to progress on the scale which experience has demonstrated to be possible, it is vitally necessary that the only organised body in this country possessing the collective influence essential to that purpose should take the matter up. We refer, of course, to the I.M.E.A., and we would again urge that this association should recognise the necessity of coming to some agreement with a view to fixing standard lines of development, standard dimensions and ratings, and aiming at some degree of interchangeability, as the best means at the moment for placing electric cooking on a commercially competitive basis, and hastening the introduction of hiring facilities. The manufacturer hesitates because he thinks he can afford to wait; the station engineer, if he is out for business, cannot afford to wait, and if he has any doubt on the matter, a study of the Marylebone load curves ought to convince him.

THE tone of the copper market remains The Copper very steady, not to say firm, and this Position. although it is known that in North America efforts are being made to get increased capacity to work, with the intention of taking advantage of the very remunerative prices which are being realised for metal by the leading producers. The demand is very good on account of the makers of war munitions in all parts of the world, but there is very little business doing in connection with the ordinary sources of peaceful absorption. whole of the cartridge plants in the United Kingdom are running as fully as the Trade Unions will permit, but it is possible for a good deal more to be turned out than is being done. On the other hand, the French works are making material at a great rate, and it is very fortunate for us that the British Government is able to get large quantities of munitions from the United States. It would be a poor look-out for us were it not that we can call upon the working men of North America to "do their bit" to help the nation to provide the means of offence and defence in Flanders, which are not to be got, except grudgingly, from some of the men at home. It is due to the large orders for cartridges placed in the United States that the American brass

trade is so busily employed, and the activity in this direction is taken as a very gratifying feature, for it has helped to rehabilitate a trade which was feeling the fullest effects of the outbreak of war, and the constriction of credit which followed it, in its early stages. Demands have undeniably outstripped the very low point of consumption which was established last autumn, and an increase in output is thoroughly justified by the growing consumption on both sides of the Atlantic.

Producers are very well sold indeed, and the tendency of prices at the moment is firm both here and in America. There is some demand still met with for early deliveries, but those in the fortunate position of being able to supply needs in this direction are very cuary or purious with their material, foreseeing that by holding on they may supply needs in this direction are very chary of parting felt in some American quarters to be a chance of the stocks in the hands of producers being added to in the near future owing to the smaller export movement recently met with, and certainly the February exports were quite small. It is probable, indeed, that the holdings of first hands across the Atlantic have undergone some expansion, possibly as much as 8,000 tons during last month, but this is not likely to cause any discontent generally, for it is recognised that the shipping position is one of the greatest difficulty, and that a restriction in the export movement is due not so much to lack of absorbing power as to the absence for a time of the means of forwarding copper from the producers' to the consumers' works. It is the current belief that American production is now proceeding at the rate of about 40,000 tons a month, and that a steady increase upon this figure is likely to be seen over the next six months or so.

American Trade
Development.

AMPLE evidence is forthcoming that
American firms and the American Government are determined to take full advantage

ment are determined to take full advantage of the existing crisis in Europe for the development of American trade at the expense of her former competitors. Realisation of this fact should do much to encourage our manufacturers to do the best that can possibly be done under existing circumstances. In few trades is the activity of American firms likely to be greater than in the electrical trade, for which the United States is particularly well placed. We are constrained to call attention to these circumstances again, because we notice that the American Government has recently caused its Consular Officers abroad to prepare extensive reports on hydro-electric enterprises in various countries, and the outlook for augmented sales of elec-trical materials and supplies of all kinds. These reports in the main are not being published, but we are able to print certain extracts from one or two of them, under the heading, "Consular Notes," on another page. The complete reports, in manuscript form, are being placed in the industrial centres of the United States, where they may be inspected by manufacturers and exporters. For a variety of reasons many of our manufacturers are at the present moment unable to do very much in the way of trade extension, but we would urge on them the desirability of maintaining a firm hold on their markets, so that when the war is over they may retain the business they previously had, and also assure to themselves a fair prospect of further extension. To this end we would again impress upon the Government the need for developing its present activities on the lines of obtaining from abroad specialised reports on individual trades.

A South Wales Mining Installation. THE paper read by Mr. Sparks on "Electricity Applied to Mining," before the Institution of Electrical Engineers, of which we are publishing an abstract,

forms an instructive addition to the previous paper by the same author, which was abstracted in our issue of April 20th, 1906. Progress in the meantime has been such that the station capacity has increased to eight times as much as in 1905, viz., 24,000 H.P.; the B.H.P. of motors connected to 44,800, and the annual output of energy to

between 50 and 60 million units, or about 12 times as much. In fact, the scheme is possibly the largest of its kind in the country, and the paper certainly one of the most informing on the subject that we have had.

For generating purposes both live and exhaust steam turbines and gas engines are employed on a fairly large scale, and no doubt there are many who wish it had been possible to include some data relative to the cost of gene-

rating as between these different plants.

The author informs us that the gas engines with a 72 per cent. annual load factor require 18 B.TH.U. per watt-hour or half the amount required by the live steam turbine plant, and their operating cost is sensibly lessened by the sale of by-products, but one is somewhat disappointed to find from another paragraph that these 1,200 and 2,400-B.H.P. engines, as the result of experience, are only supplying average loads of 600 and 1,200 kw. respectively, the combined maximum load being 2,200 kw. We may note, in passing, that an illustrated description of the earlier gas engine sets has

appeared in our pages.

Very extensive use appears to have been made of exhaust steam turbine plant, and it would seem that a number of steam winding engines have thereby secured a new lease of life; on the other hand, a very fine electrical winding plant on the Ilgner system has been installed at the Britannia Pit, of which some views were included in our pages last week, and there is also a three-phase induction motor-driven winder of smaller size at another pit. The latter has been in satisfactory operation for the last six years, and we gather that the sudden loads of 750 K.v.A., every 45 or 50 seconds, are satisfactorily dealt with at the power station by a Tirrill regulator. Thus the winding problem is being dealt with in various ways, more or less electrical, and it would have given additional interest to the paper had some further reference been made to the conditions determining the choice of means. Mr. Sparks, for instance, makes the general statement that where a colliery is equipped with main steam winders, the cost of conversion to complete electrification is seldom justified; this has been the position for some years, but the conditions have materially altered in that time, and, without further information, it is difficult to gauge the exact position of electric winding at the present moment.

# THE SELLING SIDE OF ELECTRICITY SUPPLY.—II.

AN IRON CAMPAIGN.

WITH the heating season drawing to a close, one's plans for a spring campaign must be laid, for "business as usual" is still the order. This year economy will, no doubt, be the rule in most British homes, and the housewife will be looking round for possible savings to counteract the advances in food costs. There is one way in which she can do this; in most houses a great deal too much laundry is sent out. There is room for a saving here without reducing the standard of living, and whether the work is done by herself or by the servants, an electric iron will be welcomed. There is an extra amount of washing to be done in conjunction with spring cleaning, and this should be our opportunity. The electric iron is one of the many electrical home conveniences without a close rival. I have often wondered if electrical people themselves realise that it is the delight of those who have adopted it, and one of the last things they will let go. From a supply point of view, the iron is a profit-earner; even if we accept such a low estimate as two hours' use a week for 50 weeks in the year, each iron should consume 25 units, and none of these are likely to be used on the peak load. If we sell 1,000 irons then in the next three months, we shall add 25,000 units to our output, and as most of these will be used on lighting circuits, we are getting lighting rates for power. Good business; now, how to set

First, there is the shop front display. It may be possible to arrange with one of the laundries in the district to send

a girl down with material each day to do actual ironing in the window. This could be kept up so long as results were good—there is nothing so telling as a practical demonstra-tion. They might possibly be induced to do this without charge if the value of it to themselves from an advertising point of view were well put to them. They could be offered a notice, to be fixed by the demonstrator, pointing out that the work done in their laundry was carried out by the same hygienic methods as shown. At the same time the opportunity should not be lost of endeavouring to secure their

The large manufacturers of electric irons would be only too pleased to co-operate in finding advertising matter, and are always willing to over-print with your own name.

One of the great barriers to the electric iron is the old sadiron, spirit, gas or charcoal iron already in use. There represent an investment and a habit not always easy to One way to get over this difficulty is to offer an allowance for each old iron, as part payment for a new electric one. "New irons for old" can be the slogan. Taking the selling price at about 12s. 6d., and the discount at  $33\frac{1}{3}$ per cent., the gross profit would be about 4s. One could offer a credit of, say, 6d., for an ordinary sadiron and 1s. 6d. for a gas or spirit iron.

This introduces a bargain feature to the sale which is very dear to the hearts of the ladies, and also gets the old irons out of the way, so that they can't be used. to bring in the orders a time limit should be attached to the offer, or perhaps, better still, it could be offered to the first 250 purchasers. If advisable, an extension to 500 or more would follow. This would be, of course, widely announced as being due to the great success of the pre-

liminary offer. If those of our readers who adopt this idea keep the irons bought in until the end of the campaign and, before selling them to the scrap-iron merchant, pile them up into a heap and take a photograph, we shall be pleased to receive a

Other publicity efforts must be made, advertisements put such a novel event as new irons for old might well be sent and find a corner in the news columns. The next quarter's accounts could have particulars printed on the back. On the front room might be found for a brief announcement: "New irons for old, see over." A paragraph could be typed into each letter leaving the office to local personssufficient use is not always made of this very valuable means of business getting. Of course advertising literature would be enclosed in all outgoing postal communications.

Then there is the question of a house-to-house canvass; if no canvasser is employed, a suitable man might be borrowed from the meter reading department, or perhaps a lady taken on temporarily. It will be found most helpful to offer a week's free trial; only a very small percentage are ever There is no harm in circularising non-users of returned. electric light; it will make them wish they had it, and set them thinking, which is all to the good.

Records should be kept of the number and wattage sold, left on trial, collected, &c., day by day. These records will be found inspiring and useful for the next iron campaign.

With regard to repairs to irons on circuit, charges for these should be kept to a minimum. The most frequent trouble is the flexible getting dragged out of the connecting terminals; anyone can fix this up with a penknife, for cutting back, and a bradawl. A good impression is created if no charge is made on such occasions. Another trouble is the deterioration of the flex; this is largely caused through winding it round the iron when the latter is hot, and so destroying the insulation. A few points such as these might be impressed upon the customer after the purchase has been made; it will obviate much future bother.

The B.A. Meeting at Manchester.—The Times states that it has been decided that the annual meeting of the Striish Association shall take place at Manchester, as arranged, in September next. The meeting will be restricted to its more ccientific functions, and there will not be the usual elaborate local beautiful in the form of second strip in the form of second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second seco hospitality, in the form of sceid and other arrangements.

### LEGAL.

BRITISH INSULATED AND HRLSBY CABLES, LTD., r. CRITTALL MANUFACTURING CO., LTD.

(Continued from page 351.)

FURTHER evidence for the defence was given when the hearing

MR. A. W. READ, an electrical engineer and one of the defendants' representatives, gave evidence as to the testing of the machine at the plaintiffs' works after which, he said, it was sent back to Braintree, where it was installed with the generator under his supervision, and it was arranged that the clamps should be redesigned for a specific for small frames.

re-designed for a section for small frames.

By the REFEREE: The clamp arrangement was new to him at that time, as he had then had no experience. Electrical engineers were not as a rule thoroughly conversant with electric welding.

Examination continued: Subsequently Mr. Bucher, the plaintiffs'

Examination continued: Subsequently Mr. Bucher, the plaintiffs' representative, made tests extending over two days, and on that occasion he (witness) suggested that the machine might have been inaccurately erected, but he (Mr. Bucher) said he was satisfied that it was properly and well erected. Mr. Bucher tried to make several welds on that occasion, using the clamp which had been made by the defendants, but he met with very indifferent success. He made a number of changes and adjustments in both the clamps and the machine, and, after two days' experimenting, he said that the machine, in its them state, would not enable him to make the tests, and that he was returning to make the gauges and stops necessary. It was arranged that he should do this, and he subsequently paid a second visit. But when he tried to make the welds there was the same indifference which was found in the first test. The only marked improvement was that the clamps were put nearer to the ends of the section. Taking the welds as a whole, they were absolutely unreliable, and blowholes were much in evidence.

On March 10th further evidence was given for the defence.

On March 10th further evidence was given for the defence.

MR. F. H. CRITTALL, a member of the defendant company, described in detail the materials used for the experiments with the plaintiffs' machines, and the manner in which the claims for work done in connection with those experiments were made up. He said that the firm strained every nerve to get the machine to work as they perticularly wented it.

MR. VALENTINE GEO. CRITTALL, general manager of the defendant company, said that they had been welding by the oxy-acetylene process, which was the best process they had been able to get up to now, and they worked upon the same material as that for which to now, and they worked upon the same material as that for which they wanted the electrical machine. Their reason for desiring to make a change was that their oxygen bill was looking big. They desired to try electricity owing to the cost of oxygen, and the fact that the gas process called for certain skill on the part of the operator. It was also understood that by using electricity they would be able to get an increased output. When Mr. Harrison visited the works in 1911, witness took him over the building and showed him what the business was. The material which Mr. Harrison saw at that time was rolled metal, practically identical with that which they asked the plaintiffs to provide a machine to with that which they asked the plaintiffs to provide a machine to

with that which they asked the plaintiffs to provide a machine to weld.

Mr. Wm. Crawter, electrical engineer and director of the defendant company, who was formerly manager of the defendants' works, gave evidence as to the discussions with Mr. Harrison, which led to the plaintiffs undertaking to make the welding machine. The question of the desirability of using electricity in the place of gas for welding frames was first raised by him. In 1911, he said, he had more than one conversation with Mr. Harrison, who was employed by the plaintiffs, as to the possibility of his company being able to supply machines for the purpose of welding casement frames electrically, and Mr. Harrison said that it would be possible as they had already made a welder for printers' chases, for which a great degree of accuracy was required. It was arranged that samples of the company's material should be sent for welding at the corners. Subsequently the machine was ordered. At first English material was sent for trial, and subsequently German material was supplied, which was better as regards accuracy, and upon that they worked; but the results were not satisfactory. He looked upon the plaintiffs as experts in that particular kind of work, and relied upon their skill and knowledge. The defendants were really anxious to get the machine, and there was no foundation for the assertion that they desired to get rid of it.

A discussion then took place on the application of plaintiffs' counsel that the Referee should visit the works and order experiments to be carried out in his presence.

Mr. Greer, K.C., contended that the Referee had the power to make such an order under Order 50, Rule 4, which said that it should be lawful for any Judge to inspect any property or thing

MR. GREER, K.C., contended that the Referee had the power to make such an order under Order 50, Rule 4, which said that it should be lawful for any Judge to inspect any property or thing concerning which any question might arise. The Official Referee was brought within that rule. He agreed that the order did not say that experiments might be ordered, but he contended that it was implied. He did not wish the Referee to inspect the machine merely to see what it was like, but he desired that a trial should be ordered to take place in his presence in order that he might see how the machine did its work. how the machine did its work.

The REFEREE: Does the defendant object!
MR. COLAM, K.C.: I do.

The REFEREE said that under the circumstances he would not make an order, but as the matter was of some importance he thought he ought to state his reasons for declining. In the first In the first place, it was a matter of judicial discretion to be exercised according to settled principles. Undoubtedly the power existed under which he could order experiments to be made, but it was a matter of judicial discretion to say whether it should be done or not. The opinion, or what he might call the verdict of the Judge, must not be given as a consequence of his views as to the verylis of The opinion, or what he might call the verdict of the Judge, must not be given as a consequence of his views as to the results of inspection or experimenting, which were only for the purpose of enabling him to understand and apply the evidence. In this case he did not think, after having heard the evidence, that an inspection was necessary. It appeared to him that he could not be guided rightly, in arriving at a decision, by the results of any experiments which he might see. He therefore proposed, subject to the convenience of the parties, that further evidence should be called if necessary. called if necessar

MB. COLAM said that if experiments were desired they ought to have been made months ago, and if further expert evidence was to be called he ought to be allowed a little time to call expert witnesses in reply. Of course if the plaintiffs were going to call experts he wanted to know what they were going to say.

THE REFEREE: If you talk much more about it I shall have to

alter my decision and go down.

MR. WALTER FRANCIS CRITTALL, one of the directors of the defendant company, then gave evidence as to a test which was made in his presence after certain alterations had been made in the machine. Those experiments, he said, consisted of making six welds with short pieces of metal, but he did not regard any of them as satisfactory.

The hearing was then adjourned until Monday, March 15th.

#### TUNGSTEN DRAWN WIRE .- LICENCE REFUSED.

ME. JUSTICE WARBINGTON, in the Chancery Division, delivered his reserved judgment in this case, reported in preceding issues. His Lordship said he believed this was the first petition under the Section to come before the Court. Sec. 24 provided that any person interested might present a petition to the Board of Trade praying for the grant of a compulsory licence, or, in the alternative, for the revocation of a patent. The Board would consider the petition and if the parties did not come to an arrangement between the revocation of a patent. The Board would consider the petition, and if the parties did not come to an arrangement between themselves the Board, if satisfied that a prima facie case had been made out, would refer the petition to the Court, and if the Board were not so satisfied they might dismiss the petition. If it was proved to the satisfaction of the Court that the reasonable requirements of the public with reference to the patented invention had not been satisfied, the patentee might be ordered by the Court to grant a licence on such terms as the Court night think just. It seemed to him that in order to establish a case within the Saction, the petitioner must prove not only default towards him-It seemed to him that in order to establish a case within the Section, the petitioner must prove not only default towards himself but towards the public generally. The expression, "trade or industry," seemed to him to be used in a wide sense, as in the case of the expression "woollen trade," or "cotton trade," and the use of the expression "trade or industry" in the petition was not enough to establish that a particular trade was unfairly prejudiced. It must be proved that the trade or industry as a whole was affected. The establishment of a new trade or industry was a different thing altogether from the entry of a particular person into an existing trade or industry. If the default towards the public was established, the Section conferred two alternative rights:—First, the right of the individual to present a petition to have a licence granted to himself; and, secondly, the right of the public was established, the Section conferred two alternative rights:—First, the right of the individual to present a petition to have a licence granted to himself; and, secondly, the right of the public to be relieved from the effects of the patente's monopoly by the revocation of the patent. His Lordship had to determine whether on the facts of the present case the petitioners had established that the reasonable requirements of the public were "to be deemed not to have been satisfied." The two respondent companies, together with the General Electric Cc., Ltd., had pooled their patents, and thus controlled, to a large extent, the industry connected with electric incandescent lamps. To prevent the cutting of prices, they required from dealers and licensees that they should not sell below certain list prices. The firms and companies controlling the sale of the lamps were known as the Tungsten Lamp Association, and the result of their action was that the price of the lamps was considerably higher in this country than abroad. There was, however, no evidence that the price was so high as to be a serious burden on the consumer, or to be unreasonable, and the fact was that in the last two or three years the price had been considerably reduced, while the supply of lamps was quite adequate to meet the demands of the public. The petition was founded on the allegation that drawn tungsten wire was a patented article, and that the patentees had failed to supply this to the petitionera, or to grant a licence on reasonable terms, and that the establishment of what the petitioners called a new trade or industry in the making of their lamps had been unfairly prejudiced. It had been shown on the petitioners' own evidence that there was no trade or industry with which drawn tungsten wire was connected except the making of electric lamps, and there was no demand for the wire except in that connection. The petitioners had not proved that the respondents had been guilty of the default indicated by the Act, namely, in the matter of amply satisfied in this respect. Nor had they proved as regarded the licence any default except in reference to themselves. It was common ground that licences had been granted, and no attempt had been made to show that the terms were unreasonable. In his opinion, the trade or industry to be considered was that of the making of tungsten electric lamps, and this would be nothing more than the entry of a fresh trader into an existing trade or industry. There was no ground for suggesting that this trade or industry

had been unfairly prejudiced by the respondents. On the petitioners' own evidence, therefore, he had come to the conclusion that they had failed to establish the case required by the Act, and he must dismiss the petition with costs.

Council appearing in the case were: For the petitioners, Mr. Bousfield, K.O., Mr. Cave, K.O., M.P., and Mr. R. Frost; for the British Thomson-Houston Co., Mr. A. J. Walter, K.C., Mr. J. H. Gray, and Mr. Lunge; for Siemens Bros. & Co., Mr. Colefax and Mr. Hume.

Solicitors for the petitioners, Messrs. Ashurst, Morris, Crisp and Co. 4 for the respondents, Bristows, Cooke and Carpmæl.

NEWCASTLE-ON-TYNE ELECTRIC SUPPLY CO. SUMMONED.

AT Newcastle-on-Tyne Police Court on 12th inst., the Newcastle-on-Tyne Electric Supply Co., Ltd., were summoned on the information of Andrew Gemmell, of Castle Nook, Ovingham-on-Tyne, "that they on August 23rd, 1914, being the undertakers within the meaning of the Electric Lighting Act, 1882, did unlawfully make default in complying with the provisions of the Act and of the Electric Lighting (Clauses) Act, 1899, by not selling to the complainant a copy of the annual statement of accounts of their undertaking, made up to December 31st, 1912, the complainant having paid the sum legally demanded for the same; and in such default continued until the date of the laying of the information."

of the information."

MR. CHARLESWORTH, for the prosecution, said that Mr. Gemmell was a gentleman interested in electrical business, and he made an application on July 8th, 1914, for a copy of the accounts of the Company, and he also wanted a copy of the auditor's report. Mr. Charlesworth said the accounts in question referred to the year 1912, and were audited in July, 1913, and he maintained that whether the application were made to the Board of Trade or not, the defendants were bound under the section to supply a full copy of the report unless the Board of Trade directed otherwise.

Andrew Gemmell said he made application for a copy of the accounts, with the Board of Trade auditor's report, and sent the statutory fee of 1s. He claimed that if the Board of Trade did not direct to the contrary, he should have had a full copy of the auditor's report.

WITNESS, in reply to Mr. Burton (who appeared for the company), said that he received a copy of the auditor's report on March 3rd last, but he was not satisfied, because it was two years after the period referred to.

The CLERK (to Mr. Burton): Is it your contention that you are not bound to supply the report of the auditor in the absence of any direction from the Board of Trade?

MR. BURTON: That is my argument. The point was raised by the same gentleman in a prosecution about four years ago, and decided against Mr. Gemmell.

MATTHEW SHORT secretary of the defendant company pro-

MATTHEW SHORT, secretary of the defendant company, produced the Board of Trade report, which he said he received last week. The report was cent in July last year, with a request for observations thereon. The letter of March was the first authorising him to publish the report.

In cross-examination, MR, SHORT said they looked upon the auditor's report as a confidential document.

MR. BURTON said the company's view coincided with what they had heard from the Board of Trade. This was a Board of Trade document, and was in the nature of a confidential document and could not be published without the authority of the Board of Trade be obtained before the company could publish the whole or any part of the report. The company did not get that direction until a week ago—or after the summons was issued. The delay was due probably to the war. At August 23rd the matter was subjudice, and it would have been highly improper for them to have supplied Mr. Gemmell with a copy of the report.

The CHAIRMAN (Sir Joseph Bexter Ellis) said that the Bench were of opinion that the company had not disoharged the whole of their statutory obligations. They thought, however, that there had been many difficulties to deal with, and under the circumstances the magistrates considered the case would be met by dismissing the summons on the payment of costs.

CITY OF LONDON ELECTRIC LIGHTING Co., LTD., c. BENNETT.

In the City of London Court on Tuesday, before his Honour Judge Rantoul, K.C., this case was heard, in which the plaintiff company sought to have the defendant, Mr. E. G. Bennett, Ludgate Arcade, committed for the non-payment of £7 7s. 1d. for electric current supplied.

DEFENDANT said he did not think the plaintiffs were going to press for his committal as they were doing, or he would never have used their electric supply. He had lost his all, and after trading for 47 years he thought it rather hard that he should be sent to

prison because he could not pay his electric lighting account.

JUDGE RENTOUL ordered payment of 2s. 6d. per month.

### B. L. Jones & Co., v. ORPHEUM, LTD.

JUDGMENT in this case, which was partly reported in our last issue, was given on Tuesday. We shall report the proceedings in our next issue, but may state that judgment was given for the plaintiffs for £136 11s. 10d., the £96 11s. 10d. paid into Court under Order 14 to be paid out in part satisfaction of the judgment.

#### HERBERT MORRIS, LTD., v. SAXELBY.

THIS case came before the Master of the Rolls, Lord Justice Phillimore, and Mr. Justice Joyce, upon the appeal of the plaintiff company, who are manufacturers of pulley blocks, overhead runways, &c., at Loughborough, from a judgment of Mr. Justice Sargant, in the Chancery Division. The facts were reported in our issue of November 6th, 1914, page 618.

Sir R. Finlay, K.C., Mr. A. J. Walter, K.C., and Mr. Kerly, K.C., appeared in support of the appeal; and Mr. Mark Romer, K.C., and Mr. Sheldon for the respondent.

Sir R. Finlay contended that, in the circumstances, having regard to the nature of the plaintiffs' business, the covenant in question was not too wide for the plaintiffs' protection, and sould not, and ought not, to be construed as in restraint of trade.

not, and ought not, to be construed as in restraint of trade.

MR. ROMER contended that the decision of Mr. Justice Sargant MR. ROMER contended that the decision of Mr. Justice Sargant was right, and that the covenant was too wide, and therefore invalid. He agreed that, speaking generally, every employer was entitled to have a covenant which would prevent his employé disclosing trade secrets, with proper limitations of time and space; but he submitted an employer was not entitled to a covenant which would prevent the employé from using the skill and business training which he had gathered in the course of his employment. At the conclusion of the arguments of counsel, their Lordships reserved judgment.

reserved judgment.

#### NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

#### Country House Lighting Sets.

The generating plant illustrated in fig. 1 comprises a Vickers 6-kw. 800-B.P.M. 100-148-volt, 59-41-ampere dynamo, coupled up to a 10-H.P. Belliss engine, installed at Ampton Hall, and used for lighting and power purposes. Current is supplied for 250 lights in the residence, ranging from 10 C.P. to 50 C.P., the storage battery

being of 300 ampere-hours capacity.

On the power side current is taken by a Vickers 2-H.P. motor to drive a pump in connection with the house water supply, and in

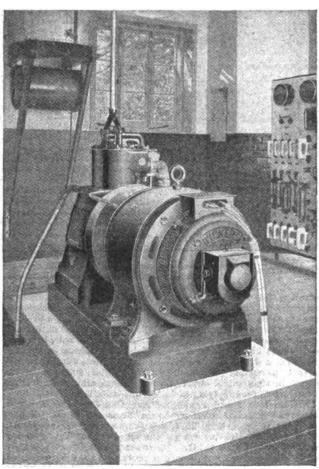

FIG. 1.-VICKERS-BELLISS COUNTRY HOUSE LIGHTING SET.

the garage repair works a Vickers 2-H.P. motor is installed for driving, by means of shafting, a number of machines, including a lathe, grinder, &c.

The entire installation work was carried out by MESSES. MANN, EGERTON & Co., LTD., under the supervision of Mr. W. C.

Hawtayne.

Anti-Aircraft Searchlight.

Amongst other types of searchlights, the LONDON ELECTRIC FIRM, of George Street, Croydon, are at present turning out a new pattern for anti-aircraft and similar purposes, arranged to

work at an elevation of as much as  $90^{\circ}$  (fig. 2). The machine is 24 in in diameter with silvered parabolic mirrors, and revolves on ball bearings, a geared quadrant with a brake being provided for elevation; and the design eliminates the twisting of the connecting cables. The machines are arranged to work through resistances on 80 volts or higher pressures. The new lamp has the

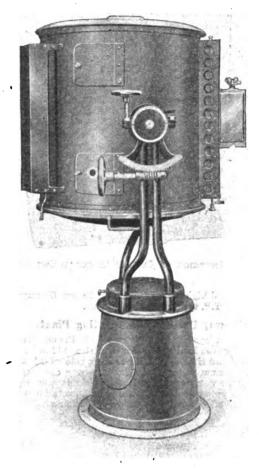

FIG. 2.—ANTI-AIRCRAFT PROJECTOR.

feature of combined auto and hand feed, allowing of adjustment of the carbons whilst still working automatic without any change-

### New Pattern "Tucker" Ironclad Switches.

MESSES, J. H. TUCKER & Co., of Birmingham, have recently placed on the market a new pattern of ironclad switch intended primarily for conditions where a first-class job is necessary, and price is a vital question.

A usual feature in low-priced ironclad switches hitherto has been the "slot" in the centre of cover. The disadvantages of such "slot" are obvious, not the least being the difficulty of "earthing" the handle. A strong feature in favour of the "slotted" cover switch has been its price, that of the solid cover "side handle" type being generally prohibitive in comparison.

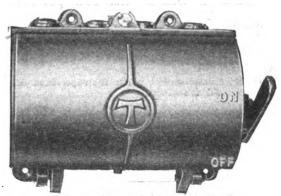

FIG. 3.-TUCKER IRONCLAD SWITCH.

In the new line Messrs. Tucker are combining advantages of both these patterns by (a) doing away with the "slot" in the cover, which is solid; the D.P. have "side," the T.P. "Stirrup" handles; (b) the handle is in permanent and certain contact with the case for "earthing" purposes; and (c) they are making arrangements for the production of these switches in large quantities, so that they will cost no more than the "slotted" cover type, which they will contact the state of the second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second second seco will displace,

Each pole is mounted on a separate vitreous china base; the cover "interlooked" with the handle, and the position of the switch

is indicated on the cover.

In accordance with their standard practice every switch case is fitted with substantial earthing terminal, and enamelled and

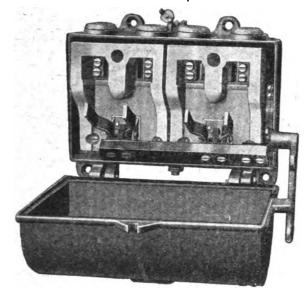

FIG. 4.-INTERIOR OF TUCKER IRONCLAD SWITCH.

"stoved" to a hard high-class finish. The 30 and 50-ampere sizes in both D.P. and T.P. types are now available.

### Railway Construction Lighting Plant.

Electric light played an important part in the construction of the Pricaks-Upington Railway, in South Africa, 142 miles of track being laid in record time, and at the average rate of 2½ miles per day. The maximum mileage completed in any one day was 3½ miles. After the work was properly set going, it was carried on day and night, an up-to-date electric light generating plant (see illustration) enabling operations to proceed after sundown. The

FIG. 5.—ELECTRIC LIGHTING PLANT FOR URGENT RAILWAY COUSTRUCTION.

espeedy construction of the line was considered necessary in order to facilitate the movement of troops towards the Garman South-West border, and to admit of assistance being rendered in the field with the greater promptitude which rail communication would afford. The line was built departmentally by the South African Railway Administration under the supervision of Management and the supervision of Management and the supervision of Management and the supervision of Management and the supervision of Management and the supervision of Management and the supervision of Management and the supervision of Management and the supervision of Management and the supervision of Management and the supervision of Management and the supervision of Management and the supervision of Management and the supervision of Management and the supervision of Management and the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the supervision of the super African Railway Administration, under the supervision of Mr. N. K. Prettejohn, resident engineer.

### BUSINESS NOTES.

Consular Notes.—CANADA.—The American Consul at Cornwall (Canada), in a recent report, states that the 45-mile transmission cable to carry 85,000 H.P. of electrical energy from Cedar Rapids in the St. Lawrence River past Cornwall to Massena (U.S.A.) is now in operation. During the first week of January of this year the current was flashed for the first time along the entire length of the cables. There are six of these cables (two circuits) each cable below. entire length of the cables. There are six of these cables (two circuits) each cable being aluminium one inch in diameter on a steel core. It is stated that the additional electric power is being used by the aluminium plant at Massena to operate a large increase recently made in this plant in building and equipment. Some of the power is serving for the reduction of the ore in the pot-room of the aluminium works. Cornwall's industries can have the privilege of tapping this transmission line of electric power at a reasonable rate. It is said, however, that it would be necessary to erect a sub-station at Cornwall, costing at least £10,000, before

tapping could be effected.

CHINA.—According to the American Consul at Chungking, there are great potential possibilities for electrical development in Szechuan Province; many of its cities have excellent water powers close at hand, the cost of kerosine and other illuminants is very high, and in numbers its population exceeds that of any other Province. and in numbers its population exceeds that of any other Province. Szechuan is also very wealthy, and sooner or later there is sure to be an era of vast commercial development. Large industrial projects are under consideration, and electrical equipment of all kinds will some day enjoy a very large sale. Owing to the unsettled conditions in China and the war in Europe the trade of the province is at present becoming very slack; adverse exchange and increased prices of foreign articles have caused imports to dwindle. Chinese capitalists, too, have grown timid and hesitate to invest in industrial undertakings. A few years ago the installation of an electric light plant in the city of Tzechow seemed assured; part of the capital had been subscribed, and negotiations had been opened for the appointment of an American electrical engineer. The Revolution in 1911, and the local insurrection of 1913, however, caused those for the appointment of an American electrical engineer. The Revolution in 1911, and the local insurrection of 1913, however, caused those interested to abandon the idea. Recently an influential resident of Tzechow, when requested to give his opinion as to the present and future demand for machinery, stated that at present there was no demand, but there was talk of electric light plants for the city and pumps for the coal mines. The promoters of these schemes do not seem to have got beyond the "talk" stage, but the situation at Tzechow is more encouraging than in other parts of the Province. What the Chinese need most at the present time is money. There are many industrial enterprises which would prove highly profitable, but there is no way to finance them. The Chinese are anxious to develop the country, and many towns would install profitable, but there is no way to finance them. The Chinese are anxious to develop the country, and many towns would install telephones and electric lighting plants if sufficient money could be obtained. The sale of electrical machinery should, in many cases, be accompanied by a loan, and the companies which adopt this method will very likely secure the bulk of the trade. There is a possible market in the Province for the sale of small lighting plants for theatres and other large buildings. Many private users of current find it advantageous to maintain their own lighting sets; the American Methodist Mission in Chungking has done this successfully for several years, and the Canadian Methodist Mission at Chengtu is negotiating for a private plant. at Cheng'tu is negotiating for a private plant.

In a report just issued, the American Consul at Shanghai states

that at the present time there is practically no hydro-electric power development in China. Such electrical plants as have been installed in the country are driven almost entirely by steam. The immense delta plants as here been installed in the country are driven almost entirely by steam. plains of the Yangtze and Yellow Rivers are not, in a sense, suitable general hydro-electric plants, but in Fukien, Yunnan, and parts of Shantung Provinces, as well as the Yangtze gorges, power stations of this type may ultimately be installed. While it may be stated broadly that no hydro-electric plants are in operation in China, stations for supplying current to the cities of Yunnanfor and Changtu have been partially arranged for through negotiations taken up by Germans with the up by Germans with the Chinese Government. In-quiries made through German sources, however, fail to dis-

close any pertinent details regarding this undertaking. In other instances, native Chinese companies in connection with Chinese Chambers of Commerce companies in connection with Uninese Unambers of Commerce have agitated for the development of waterpowers, and have endeavoured to arrange with the Chinese provincial authorities for permission to build such plants. As a general rule, however, the Chinese have not been successful in organising companies with such a degree of financial backing and standing as would warrant provincial or central governmental support, which support in time would enable foreign engineering firms to enter

into contracts for supplying materials and installing plants.

INDIA.—In a recent report the American Consul at Rangoon states that electrical development in Burma is in its infancy.

Outside of Rangoon and Mandalay there are no electric plants, except a small lighting set in the oil fields at Yenangyoung except a small lighting set in the oil fields at Yenangyoung operated by the Burma Oil C). There are practically no privately owned isolated plants in Burma, due probably to the high cost of erection and the very small population able to afford electric light and power. At present kerosene is the almost universal medium of lighting, the poorer natives using Burma oil and the European and wealthy natives American kerosene. While there is no doubt that eventually electrical plants will be erected in the more important towns of Burma little development can be expected in the present distressed condition of trade. the present distressed condition of trade.

The only electrical plant in Rangoon is operated by the Rangoon Electric Tramways and Supply Co., which has 3,000 residence connections. Its rates are 7d. per British Board of Trade unit for lighting, 6d. per unit for combined lighting and power for fans, and 3½d. per unit for power. To Government railways and other large consumers special rates are given, which average 3d. per unit. This company also deals in electrical supplies of all kinds. The Burma Electric Tramways and Lighting Co., Mandalay, has 150 residence connections; rates for lighting are 8d. for the first 30 units per month, and 7d. for the next 170 units. Electric fans, both ceiling and wall, are coming into more general use, and are replacing the hand-operated Indian punkals. Nearly all offices in Rangoon are now equipped with electric fans; also clubs, places of amusement, churches, and the residences of the European community. Practically the only competitor of the United States in this market in the sale of electrical appelling is Great Rritain, which this market, in the sale of electrical supplies, is Great Britain, which furnishes four times as much as does America. It is suggested that American manufacturers should be able to supply large quantities of lamps, cooking and heating apparatus, torches, motors, generators, &c.

SIAM.—The American Vice-Consul at Bangkok reports that the SIAM.—The American Vice-Consul at Bangkok reports that the Siam Electricity Co., Ltd., had until recently the only light and power plant in Siam, and for 1913 showed gross earnings of about £100,000. The Bangkok municipal power station began operation in the early part of 1914. Both of these stations use three-phase 50-cycle current. The telegraph and telephone systems are operated by the Government.

"Electrical materials and apparatus are not manufactured in Siam hence materials for repowals and extensions of all electrical

Siam, hence materials and apparatus are not manuractured in siam, hence materials for renewals and extensions of all electrical enterprises, electric street railway equipment, lighting fixtures, telephone apparatus, cables, insulators, electric motors, fans, batteries, bells, cooking utensils, sadirons, and a variety of similar goods, should be in demand. The possibilities of extending American trade in electrical materials and apparatus might be subspaced by averaging for an artibit of such goods in Renewals. enhanced by arranging for an exhibit of such goods in Bangkok; also by American firms entering into correspondence with local consumers as to their requirements, by submitting price lists, and by appointing local agents. Agents should be supplied with samples of materials and prices for supplies needed by the Government telegraphs, telephones, and power station, as all such goods are bought through public tenders, and the time allowed is frequently not sufficient to permit bids to be submitted from American firms direct."

Bankruptcy Proceedings.—STUART ALFRED CUBZON' described as an electrical and motor engineer, of 175-6, Piccadilly, W., and late of Victoria Street, Westminster, S.W.— Piccadilly, W., and late of Victoria Street, Westminster, S.W.—
The first meeting of creditors was held on March 9th, at the
London Bankruptcy Court, under a receiving order. Mr. E.
Leadam Hough, senior Official Receiver, reported that it appeared
from the debtor's statements that he commenced business in
August, 1912, and had the sole right to sell the obsolete motor
vehicles of the London General Omnibus Co., L'd. He sold
that business in August, 1914, to the General Omnibus Supply, Ltd.,
which he had assisted to promote in April, 1912, and which was a
syndicate to promote motor-omnibus companies. It had a nominal
capital of £10,000, subsequently increased to £55,000. The
syndicate promoted Greater Omnibus Services, Ltd., with a nominal
capital of £100,000, and the debtor became joint managing
director at a salary of £750 capital of £100,000, and the debtor became joint managing director at a salary of £750 per annum. In May, 1914, that Company was amalgamated with the London Premier Omnibus Co., and the debtor held a similar position in that company. March, 1913, the debtor became interested in the General Motor Services of Russia, Ltd., which was formed to take up what was represented to be the sole concession for the running of omnibuses in the Crimea. He put between £3,000 and £4,000 of his own money into the company, and became managing director. He went to Russia to look into the matter, and found that the concession processed no value, and that a considerable empany of concession possessed no value, and that a considerable amount of debts had been incurred there by the company. In consequence of that information he dropped the whole business, and the company had now cessed to exist. In May, 1914, the debtor promoted Stuart A. Curzon (Russia), Ltd., with a nominal capital of £50,000 Stuart A. Curzon (Russia), Ltd., with a nominal capital of £50,000 to take up the running of motor-omnibuses in the Crimea in continuation of the work done by the General Motor Services of Russia, Ltd., but, owing to the war, things were at a standstill. It was his intention, however, as soon as the war was over, to carry the business through. A statement of affairs had been lodged showing liabilities £8,600 against assets valued at £10,065. The debtor, therefore did not admit insolvency, and he attributed his present position to the war, in consequence of which his Russian operations came to an end, and his English business had practically ceased. The failure was further explained by the debtor's inability to recover moneys due to him. In the absence of any offer, Mr. B. F. W. Fincham, chartered accountant (Fincham, Partridge & Co.), was elected trustee to wind up the estate in bankruptov, assisted by a committee of inspection.

Fartridge & Co.), was elected trustee to wind up the estate in bankruptov, assisted by a committee of inspection.

J. G. M. Hilton, electrical engineer, Birmingham.—A second and final dividend of 2r. 2½d, in the £ was payable of March 3rd at the Official Receiver's office, 191, Corporation Street, Birmingham.

JAMES WILLIAM & TOM WHITAKEE TATTERSALL, trading as "Tattersall & Tattersall," electrical engineers, 9, Regent Street, W., and Kimberley Boad, Willesden Lane, N.W.—A sitting of the London Bankruptov Court was held on Theedew before Metallic and the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the street of the s London Bankruptcy Court was held on Tuesday, before Mr. Registrar Linklater, for this public examination. The statement of affairs showed liabilities £3,760, and assets valued at £481. In the course of their evidence the debtors stated that in August, 1912, with about £150 capital, equally subscribed, they commenced trading in partnership as motor engineers at 9, Regent Street, their business consisting of the purchase and sale of carburetters. They invented a patent electric lighting and starting equipment for motors cars, and took out patents in Great Britain, France, and Italy. The premises at Kimberley Road were taken in November, 1913, for the purpose of manufacturing the electric starters, and, according to their calculations, they were going to make a profit of £10,000 per annum. Their output before the war was about 40 a month, but since August the trading had practically ceased. At the commencement of the war they placed their position before their principal creditors, who stated that they would not require payment of their accounts for six months, and in some cases advanced moneys for the payment of wages. In January last they again consulted their principal creditors with a view to appointing a trustee, but, the negotiations falling through, they filed their petition in February. The debtors attributed their failure and insolvency entirely to the war. The examination was concluded.

GEORGE JOHN TOM JELLEY PARFITT, 11, Priory Road, Keynsham, consulting electrical engineer.—A meeting of creditors was held at Bristol on 10th inst. The statement, according to the Watern Daily Press, showed liabilities £4.482, of which £2.026

Western Daily Press, showed liabilities £4.482, of which £2,026 will prove for dividend. The assets included 50 £1 ordinary shares in the Revenge Syndicate, 250 £1 ordinary shares, Bristol shares in the Revenge Syndicate, 250 £1 ordinary snares, Buscol International Exhibition, Ltd., £710 in debentures of that undertaking, and 1,000 preference and ordinary shares in the Keynsham Electric Light and Power Co., Ltd. The causes of failure were stated to be "losses for goods supplied to and through guarantees given for the Bristol International Exhibition, Ltd., which went into liquidation, and loss of business caused by the war." The Official Receiver said he did not see any likelihood of getting a dividend for the creditors. The Official Receiver remains trustee.

Delivate Apparements — A. J. GAGE & P. V. FRIGHT

Private Arrangements .- A. J. GAGE & P. V. FRIGHT (trading as Pattersons), electrical engineers, 26, Hawley Street, Margate.—The creditors interested herein were called together on 11th inst. at Margate, when a statement of affairs was presented 11th inst at Margate, when a statement of affairs was presented which had been prepared by Mr. J. W. Soarlett, accountant, showing the position as at March 4th last. The statement showed liabilities of £411, of which £218 was due to trade creditors, and £193 to a cash creditor. The assets were estimated to realise £210, from which had to be deducted £16 for preferential claims, leaving net assets of £195, or a deficiency of £216. In answer to questions it was stated that there was no surplus arising from the private estates of the partners. The cash creditor shown on the statement was Mrs. Fright. After a short discussion it was decided to confirm the deed of assignment already executed to Mr. Scavlett, under which it was stated that the estate would be realised. The following are creditors: ing are creditors :

Veritys, Ltd.
Turner, G. H., & Co.
Banitas Electric Co.
Meta lio Seamless Tube Co.
Fright, Mrs.

Catalogues and Lists.—Messes. L. Andrew & Co., 2, Whitworth Street West, Deangate, Manchester.—Wholesale price lesses of india-rubber gloves and gauntlets.

ME. CHAS. H. BLUME, White Buildings, Fitzalan Square, Sheffield.—Descriptive lesses concerning "Radiolac" heat-radiating insulating enamel, a heavier-bodied medium than the usual insulating varnishes, for the impregnation of electrical windings and similar purposes. "Radiolac" is being manufactured at the firm's works at Mitchem Surrey.

and similar purposes. "Radiolac" is being manufactured at the firm's works at Mitcham, Surrey.

MESSES. Beloo, LTD., Windsor House, Kingsway, London, W.C.—Illustrated priced leaflets relating to "one part" 'holders, "Dim-a-lite" turn-down switches, weatherproof "Half-watt" lanterns, and semi-indirect lighting fittings for one-watt and half-

watt lamne.

MESSES. MARPLES & LEACH, 26-30, Artillery Lane, London, E.C.—March stock list of new K. & M. type c.c. and A.C. motors, a

E.C.—March stock list of new K. & M. type C.C. and A.C. motors, a considerable number of which, ranging from \( \frac{1}{2} \) H.P. to 30 H.P., are held in stock, or on order for stock. Copies of the firm's monthly stock lists will be sent to any address regularly on application.

MESSES. DAVID BROWN & SONS (HUDDERSFIELD), LTD., Huddersfield.—136-page illustrated catalogue, giving very exhaustive information respecting their double helical gear and its application as a speed reducer. The D.B.S. process and the manufacture of the gearing are described in detail, and many pages are occupied with useful engineering tables and formulæ.

THE GENERAL ELECTRIC CO., LTD., 67. Queen Victoria Street, E.C., have issued their Osram lamp semaphore code advertisement,

THE GENERAL ELECTRIC CO., LTD., 67. Queen Victoria Street, E.C., have issued their Osram lamp semaphore code advertisement, which appeared in our last issue and attracted a good deal of attention, in the form of a postcard. Numbers of these can be obtained over-printed with the names and addresses of electrical contractors, dealers, and others interested in the sale of the lamps, by making immediate application. The reverse side of the postcard is an order form. The advertisement forms a novel and ingenious piece of electrical publicity work, and should be very telling.

MR. O. N. BECK, 11, Queen Victoria Street, London, E.C.—Folder illustrating the "Simpl." boring tools made by the Allen and Curtiss Co., of America.

and Curtiss Co., of America.

and ourses co., or america.

INDIA-RUBBEB, GUTTA-PERCHA AND TELEGRAPH WORKS Co.,
LTD., Silvertown, E.—32-page illustrated catalogue (No. 37), giving
general specification and conveniently-arranged tables of weights,
dimensions, prices and code-words relating to Silvertown dynamos
from 75 watts to 66 kw., and motors from 22 B.H.P. up to

Advances in Prices .- THE ELECTBIC AND ORDNANCE ACCESSORIES Co., LTD., announce that, owing to the present situation, and the consequent increase in cost of raw materials and labour, it has been found necessary to advance their prices for motors and dynamos by 5 per cent. Outstanding quotations are subject to immediate acceptance, and the company cannot, in any case, accept orders at the old prices except where such are based on quotations made within a period not exceeding 30 days prior to the planing of the order.

THE INDIA-RUBBER, GUTTA-PERCHA AND TELEGRAPH WORKS Co., Ltd., of Silvertown, E., announce that in consequence of the increased cost of manufacture, due to the prevailing conditions, they are compelled to advance their prices of rubber-insulated cables, wires, and flexible cords by 5 per cent., 18 from March lit

Book Notices.—Business Prospects in Russia. By A. T. Stewart. London: Francis Hodgson. 4d. net.—The author of this pamphlet, according to the preface, was in Russia last year, and while he somewhat discounts the value of his views and and waite he somewhat discounts the value of his views and figures, he advances them in the hope that they may pave the way for fuller and independent investigation by the reader. The trading power of Russia, the effects of the war upon Russian imports and exports, the controlling influence of German enterprise and German capital, are considered, and statistics are given. The author holds that numerous opportunities for British trade prise and Garman capital, are considered, and statistics are given. The author holds that numerous opportunities for British frade have been lost by reason of our unscientific organisation and apathy, but considers it inopportune to harp upon that subject, and proceeds to discuss the difficult question "What is to be done?" He urges British manufacturers not to wait, but to strike at once. After seven or eight months' war, he says that numerous preliminaries and investigations should be made now. That is what we said many months ago. Surely it is rather late in the day to give such advice. The writer, apparently against his will, is led into considering defects in our own trade policy in comparison with German, and he goes on to write of the need of direct trading by means of proper and effective direct representation, and the necessity for co-operative action amongst our manufacturers. A great variety of other points are touched upon, but all with great brevity, such as the need for revising our credit system, the question of trading licences, joint stock companies, the importance of Russian fairs, the defects in our Consular service (in Petrograd, he says, we had a Consular staff of four at the outbreak of war, coeting £1,820 per annum, and Germany had a staff of 17, costing £10,000). There is a brief chapter on engineering trade, and the well-organised German competition in the electrical branch is passingly referred to. The writer says that we must send out energetic men to advertise and create a demand for our products, and samples and models must be exhibited, and catalogues prepared in the language, currency, and measurements of Russia.

"The Theory of Alternating Currents." Vol. I. Ry A. Russell.

and samples and models must be exhibited, and catalogues pre-pared in the language, currency, and measurements of Russis.

"The Theory of Alternating Currents." Vol. I. By A. Russell.
London: Cambridge University Press. Price 15s. net.

"Norgé Vinterbilleder" is the name of a book of large collotype
views of Norway in winter, which we have received from Messrs.
James McMillan & Co., London. An article by Robert Millar, in
four languages, describes the attractions of Norway as a winter
holiday ground, and the beautiful illustrations bear out his claims.
At another time and under different direcumstances the delights holiday ground, and the beautiful illustrations bear out his claims. At another time, and under different circumstances, the delights of Norway might well entice one northwards, but during the war the face of every British sportsman will be turned to the east, and the pursuit of pleasure will be unthinkable.

"Journal of the Institution of Electrical Engineers." Vol. LIII. No. 244. March 15th, 1915. Price 3s. 6d. This issue contains papers on "Electricity Applied to Mining," by C. P. Sparks; and "Polyphase Commutator Machines and their Application," by N. Shuttleworth.

Russian Electrical Trade.—M. A. A. Kuznetzoff, Professor of the Electrotechnical Institute, has made a report on the relation of the tariffs on raw and finished products of the industry. He shows, with the aid of statistics, that at present the imports of finished electrotechnical goods are less than those made in the country, particularly in connection with apparatus and accessories required for telegraphs and telephones. This is explained by the tariffs being higher for finished goods than for the raw materials. He says that the famous Russian Siemens & Halske Co., founded with German capital, and managed by Germans, being hitherto without competitors in Russia, made Morse telegraphic apparatus at £69 each, whereas now this apparatus can be had from Russian factories at £13. This is how the Germans made money out of the factories at £13. This is how the Germans made money out of the Russian Government. The position with regard to the production of dynamos, motors, measuring apparatus and electric lamps, has become very unsatisfactory, but it is expected that it will soon improve, and that Russia not long hence will not require to import these goods from the "cultured" Germans. He says, further, that it is not enough to raise the tariffs in order to ensure the development of the electrotechnical industry in Russia; it must be carried on with Russian money, and by Russians. Further facilities for credit must be given, and geological research must be stimulated for the discovery of such necessary metals as tungsten and for the discovery of such necessary metals as tungsten and thorium. He observes that in Russia, in Transbaikal, there are deposits of thorium, and in Eastern Siberia of wolfram, but neither is exploited. Both metals were imported from Germany.

Aluminium Production in France.—The municipal authorities of Marseilles have placed under sequestration the whose headquarters are in that city, and whose capital amounts to several millions of francs. At the end of June last this company was French, but about that period it became German, following on the acquisition of the whole of its shares by the Aluminium Co., of Neuhausen, Westphalia.

Trade Announcements,—Messrs. Clough, Smith And Co., LTD., have taken over new premises at Regent House, Kingsway, W.C., to which address all communications should be sent on and after the 24th inst. Telegraphic address: "Clufmit Westcent London;" telephone number, "Gerrard 3288."

It is announced that as Mr. Fisher is serving in H.M. Forces, the business of Messrs. Fisher & Hann, electricians, of Egerton Road

and 23, St. Leonards Road, Bexhill-on-Sea, is being closed.

Army Contracts Department.—The address of the Director of Army Contracts has been changed to Imperial House, Tothill Street, Westminster. Further particulars are given in our advertisement pages.

Dissolutions and Liquidations.—Schleyder's Econ-OMIC STEAM FURNACE (CONTINENTAL), LTD.—A meeting will be held at 33, Craven House, Kingsway, W.C., on April 20th, to hear an account of the winding up from the liquidator, Mr. R. W.

POWERS & DRAYCOTT, ironmongers, cycle dealers and electrical engineers, Bedwell Lane, Four Oaks, Sutton Coldfield.—Messrs. F. H. Powers and C. R. L. Draycott have dissolved partnership. Mr. Powers will attend to debts.

Electric Meters in Russia.—The principal types of electric Meters in Kussia.—Ine principal types of electrical meters approved by the Russian Office of Weights and Measures are of German production. There is, however, no particular shortage of these, as, according to a correspondent, there has been a large decline in the number of users of current. An effort is to be made to induce the Office of Weights and Measures to approve meters made in the countries of friendly and neutral Powers, such as Switzerland, France, England, &c.

## LIGHTING and POWER NOTES.

Australia.—The Cooma (N.S.W.) Municipal Council has decided to engage an expert to report upon electric lighting schemes for the municipality.

Aylesbury.—Motor Supply.—The U.D.C. has informed the British Thomson-Houston Co. that it is willing to recommend the company's motors to intending hirers and purchasers on terms contained in the tender, and to find accommodation at the works for a supply of motors for exhibition purposes on the company's responsibility. An estimate is to be prepared for installing the E.L. at the Town Hall.

Ballymena.—Workhouse Lighting, &c.—The L.G.B. has sanctioned a loan of £3,300 for the purposes of heating and lighting the workhouse by electricity.

Barnsley.—Restricted Lighting. — The Electricity Committee has made arrangement for restricting the public lighting, in order to comply with the regulations of the military authorities.

Bath.—The Electric Lighting Committee has decided make application to the T.C. for £2,000 in respect of an expected deficit in the financial year 1914-15.

Bingley.—PROPOSED LOAN.—The U.D.C. proposes to apply to the L.G.B. for sanction to borrow £1,000 for electricity DUPPOSES

Blackburn.—New Power Station.—The new Government order discouraging local leans until the close of the war will, for the time being, put an end to the proposal to begin the erection of new electricity works at Whitebirk.

Bristol.—RESTRICTED LIGHTING.—The T.C. has been informed that a further reduction of street lighting is necessary; lights on the water front are to be masked, and all lights not extinguished must be darkened at the top and upper portion of the globe; sky signs, facias and outside lighting must be discontinued.

-Public Lighting.—The Isle of Thanet Broadstairs.-Tramway and Lighting Co. has offered to light the streets in which its cables are laid, at £2 17s. 6d. per lamp per annum on a five years contract. The capital cost of providing 170 standards, based on present prices, would be £637 10s. The U.D.C. has referred the matter to the Lighting Committee for consideration.

Buckhurst Hill (Essex). — Prov. Order. — The U.D.C. has decided to consent to the application of the County of London Electric Supply Co. for a prov. order for electric supply for the district.

Burnley.—REDUCED DISCOUNTS.—In consequence of the condition of the town's finances the rate of discount to electricity consumers is to be reduced from 10 to 5 per cent.

Canada.—The East End power station now being built by the Dominion Power and Transmission Co., of Hamilton, is situated on the Lake Ontario water-front at the extreme northeast end of the city of Hamilton. The company's present principal source of power is the hydro-electric generating plant at Power Glen, near St. Catharines, and about 35 miles distant from Hamilton. At this development there is a head of 265 ft., the water used coming from Lake Eric, via the Welland Canal. Power is supplied to subsidiary companies in Welland, St. Catharines, Thorold, Port Colborne, Grimsby, Dundas, Brantford, Oakville and Hamilton districts, but by far the largest portion goes to the city of Hamilton. Three separate transmission lines, at 45,000 volts, connect the Power Glan plant with the main switching station at connect the Power Glen plant with the main switching station at Bartonville. The new steam plant will be free from the ice troubles to which all hydro-electric plants are subject in cold weather. The plant has been designed for a capacity of 75,000 weather. The plant has been designed for a capacity of  $75\,000$  K.v.A. The turbine-generator units are each of 12,500 K.v.A. capacity, operating at 6,600 volts, three-phase, 663 cycles, 2,000R P.M., and are of the Westinghouse Parsons-Curtis type, equipped with surface condensers and L3 Blanc air pumps.—Canadian Enginear.

Belfast,-The Harbour Trust reports that during the year a 120-ton electric derrick crane has been installed at the Alexandra wharf, also four 5-ton electric gantry cranes for the coal trade,

British East Africa.—The increased and urgent demand for electricity has caused the Nairobi Electric Power and Lighting Co. to temporarily suspend the street lighting; a new generator is on order, and expected to be available in two months' time.

Chatham.—INCREASED TABIFF.—In consequence of the great increase in the cost of coal and other materials, the Kent Electric Power Co. announces that from April 1st the price of current will be increased by 20 per cent.

Colwyn Bay.—L.G.B. INQUIRY.—An inquiry was held last week on the application of the U.D.C. to borrow £35,000 for the erection of a refuse destructor and generating station adjoining the L. & N.W. Railway at Bronyant. There was no opposition.

Dublin.-INCREASED TABIFFS.-The City Electricity Committee having been reassured on the matter of coal supply, proposes to abandon the suggested increase in charges of 1d. and ½d. per unit, and to revert to the original proposal of an increase of ½d. and ½d. for lighting and power respectively.

Ealing .- ELECTRIC VEHICLE TARIFF .- The Electricity Committee has fixed the following tariff for the charging of electrical vehicles at the electricity works:—1½d, per unit plus 2s, 6d -11d. per unit plus 2s. 6d. for each connected for an off-peak supply.

Edinburgh. - Owing to the increasing demand for electric light, the Electricity Committee recommends the T.C. to proceed with the necessary extensions of supply mains to Juniper Green, Corstorphine and Liberton,

Epsom.—The electrical engineer's statement for the past quarter shows decreases, as compared with the corresponding period last year, of 41,489 units in the quantity generated, 12,700 units in the quantity sold for public lighting, and 34,934 in the quantity sold for private lighting, while the units used on works show an increase of 2,620.

Glasgow.—The B. of T. has consented to the construction of condensing water inlets, &c., in the River Ciyde, near Dalmarnock Bridge, at the new generating station. In connection with the new works it is recommended that during the next two years Mr. Lackie should be authorised to obtain advice from a consulting electrical engineer regarding the installation of machinery and plant to be put down in the new station.

Holme (Yorks.).—E.L. Scheme.—A canvass of the village is to be made on the proposed supply of electricity, the scheme being to utilise an old water mill.

Huntingdon.—REFUSE DESTRUCTOR.—The T.C. has instructed the borough surveyor to inspect a refuse destructor in another town of similar size, with a view to one being installed.

-Prov. Order.—The Southampton T.C. has Itchin.informed the U.D.C. that it has applied to the B. of T. to dispense with the Council's consent to an application for a prov. order for E.L.

Kingstown.--E.L. Scheme.--The U.D.C. has now decided to formulate an electric lighting scheme, and application is to be made to the L.G.B. for a loan for this purpose.

Kingston .- PRICE INCREASE .- The T.C. has decided, on the recommendation of the Lighting Committee, to make an all-round increase in the charges for lighting of 10 per cent., as round increase in the charges for lighting of 10 per cent., as expressed in fractions of a penny, except as regards special agreements, which will be dealt with as they expire. The chairman of the Lighting Committee stated that it would be better to wait until the Diesel oil engines had been working for a year, before forming any opinion as to their suitability. It would then be for the Council to come to some decision as to continuing the works or instituting a different system. If at the end of the year the balance-sheet was unsatisfactory, it would, no doubt, be possible to get someone to take the undertaking off the Council's hands.

Leicester.—YEAR'S WORKING.—The accounts of the electricity department for the past year showed that the excess of receipts over working expenses was £22,712, and after paying interest and sinking fund charges there was a net surplus of £7,643, which is to be carried to the district fund for the relief of

Leigh.--PLANT EXTENSIONS.—The proposal of the Blectricity Committee to duplicate certain plant at an estimated cost of £10,000 has been referred back by the T.C. for further consideration.

The T.C. has decided that from April 1st electricity for lighting places of amusement be charged for at the flat rate of 3½d, per unit; and for power purposes and outside lighting 2½d, per unit; to shopkeepere, outside lighting, 2½d, per unit, these charges to be subject to discount.

-HACKNEY .- The T.C. has decided to adopt London.the recommendations of the Sub-Committee that the annual stock taking at the electricity works be carried out by independent stock takers, so that in future the accounts of the undertaking may be presented before the summer recess; also that professional accountants shall be engaged to conduct each year a commercial audit of the accounts of the electricity department. presented before

BERMONDSEY.—The Electricity and Street Lighting Committee reports that it has been necessary to shut down the No. 2 condenser (the first evaporative condenser) for a short time as there was a leak in the exhaust pipe running between the coils of the condenser. The exhaust pipe, the Committee states, is made of t-in. plate mild steel, and is being continually corroded away. Another leak developed on the 1st inst. In the latest evaporative condenser the exhaust pipe is cast-iron and shows no signs of corrosion. It will cost about £180 to replace the mild steel exhaust pipe with a cast-iron one, and it will probably have to be replaced during the next financial year. The condenser cost £3,295, and £1,112 has been paid off the loan.

HAMMERSMITH.—The Cartage and Works Joint Committee

recommends that all regular employés other than members of the staff be granted a temporary weekly increase of 7½ 'per cent. upon their wages, provided that in no case shall the wages amount to more than 35s. per week. The Electricity Committee recommends, in addition, that regular employés receiving 35s. to 42s. 6d. a week shall be paid a temporary increase of 2s.

increase in wages of 2s. per week.

Luton.—The T.C. is recommended to give a supply of current to the factory of G. Kent, Ltd., by means of an overhead line, provided the firm pays a proportion of the cost. The electrical engineer is to report on the question of lighting the streets by electricity.

Manchester.—The Electricity Committee has decided to make a strong effort to get the Treasury and the L.G.B. to remove the ban which makes it impossible to proceed with the big power station at Bartor. The scheme involves an initial outlay just short of £550,000, and sanction has been given for the purchase of the land and the erection of the works. It was hope

have a portion of the new station at work by the autumn of 1917.

The Special Committee of the T.C. has recommended that in order to meet the increased cost of living; a war bonus of 2s. per week be peid to Corporation workmen receiving 40s. per week

or under.

Normanton.--E.L. Scheme.—The U.D.C. has decided in connection with the proposed electric lighting order to inform the B. of T. that it favours an oil-engine plant, but does not wish this to be binding, should another system be found more advan-

Rhyl.—Camp Supply.—The U.D.C. has decided to give a supply of energy to the Kinmel Military Camp at the same rate as it supplies other large consumers, plus id. per unit.

South Africa.—The Worcester (Cape Province) Municipality is about to install its own electric lighting scheme. The system is three-wire, direct-current, at 440 volts, and the plant will consist of water turbines (Pelton wheels) and a Diesel engine. The scheme is estimated to cost £15,000; the consulting engineer is Prof. Bohle, of the South African College.

A temporary breakdown recently occurred in the Johannesbuag supply, a fault occurring in a main cable tunnel, where the bitumen cable insulation began to burn.

The scheme for extending the supply of electrical energy in

The scheme for extending the supply of electrical energy in Port Elizabeth is now being carried out.

A complete new plant has been ordered which will consist of two 1,000-kw. turbo-alternator sets, with high-pressure steam turbines by Messrs. Fraser & Chalmers, alternators by Messrs. Dick, Kerr and Co., and surface condensing plants. A 500-kw. motor-converter set has been ordered from Messrs. Bruce Peebles & Co., and B.T.H. Co. will supply the switchgear. The boiler plant is being extended by the addition of two units, and a plant to mechanically handle the coal and ashes is being installed. Messrs. Fraser & Chalmers are the principal contractors for the generating plant, and will be responsible for the installation, which will be of British manufacture throughout.—South African Mining Journal. Journal.

Swinton and Pendlebury.—Public Lighting.—The U.D.C. has instituted a charge for electricity for public lighting of 14d. per unit.

Taunton.-Proposed Loan.-The T.C. has applied to the L.G.B. for a loan of £1,175 for electricity purposes, mains, services and transformers, and for sanction to transfer to the mains account £550, being the surplus of a previous loan.

Tenby.—E.L. Scheme.—The B. of T. has informed the T.C. that it would not consent to give the Courcil authority to transfer its powers to a company; also, that a clause would be introduced into every order passed during the present session that no capital should be expended until the war was over. The Council decided to proceed with the application for the order.

Truro.—E.I. SCHEME.—The T.C. has been informed by the L.G.B. that the time does not appear opportune for the raising of a loan or for the installation of a new E.L. scheme. tion was referred to the E.L. Committee.

Walkden.—In connection with the projected sinking of a new Arley mine, which will be half a mile in depth, the Earl of Ellesmere is having an extensive generating station built at his Mosley Common Collieries, near Walkden. A generating station has also been provided at his Ashton Field Colliery.

Wanstead .- Prov. Order .- The U.D.C. has deferred. until the new Council is elected, the question of consenting to the prov. order for E.L., which is being applied for by the Ccunty of London Electric Supply Co.

Wednesfield.—The Midland Electric Corporation for Power Distribution, Ltd., hs applied to the B. of T. for consent to use overhead lines at Wednesfield for the transmission of energy at a pressure of 7,000 volts

Wells (Somerset).—Prov. Order.—The T.C. has een asked by the B. of T. for its observations on the application of the Mid-Somerset E.L. Supply Co. for a prov. order to supply electricity to the district, and has informed the Board, that it considers the headquarters of the company should be in the eastern or coalfield end of the area; that the prices are far above the ordinary and the lighting area is too restricted. For these reasons the Corporation should have the power of purchase at as early a date as possible, because by reason of proximity to the Mendip coalfield it might be able to produce at a cheaper rate.

Winchester.—The Electricity Committee reported that the output for the past year was 129,900 units, as against 116,982 in the previous year, an increase of 11 per cent.

Woodford.—Prov. Order.—The U.D.C. has decided, by 5 votes to 3, not to consent to the granting of a prov. order for E.L. for the district to the County of London Electric Supply Co., Ltd. The reason for the opposition was that eight present members of the Council are not seeking re-election this year, and that, under the circumstances, it was not fair to bind the new

Yorkshire Power Bill.—The Barnsley, Bradford, Halifax, Huddersfield, Rotherham, Sheffield, and Wakefield Councils have formed a Joint Committee to oppose the Yorkshire Electric Power Bill, 1915.

### TRAMWAY and RAILWAY NOTES.

Aberdeen.-P.A.Y.E. System Discontinued. - The Corporation Tramways Committee has now recommended the T.C. to discontinue the P.A.Y.E. system of collecting fares. The Committee considers that having regard to the nature and extent of the opposition to the system on the routes where it has been in operation, it is not expedient to continue it any longer.

Ashton-under-Lyne. — Proposed Tramway CHASE.—The T.C. has decided on the recommendation of the Tram-CHASE.—The T.C. has decided on the recommendation of the Tramways Committee to take steps to purchase so much of the undertaking of the Oldham, Ashton and Hyde Electric Tramways Co. as is within the borough, and for acquiring, by lease or otherwise, the tramway between the areas of Waterloo and Bardeley if satisfactory terms can be arranged with the respective Parish Councils. The proposed purchase will be possible within six months after August 7th, 1917.

Australia.—The returns of the N.S.W. railways and tramways for the quarter ended December 31st last show a falling off in receipts in the former case, while in the latter there was an increase in earnings of £15,528, a decrease in expenditure of £26,064, in passengers carried, in 7,700,000, and in mileage, of 535,000, as compared with the corresponding quarter of the previous

The Victorian Railway Commissioners have been informed that the first of the six 10,000-kw. Parsons units for the Newport power house has been successfully tested. Work is in progress on the boiler house and a quantity of material has arrived.

The Hawthorne (Vic.) Tramway Trust is obtaining a car body built entirely of Australian timber as an experiment.

An association of local bodies is being convened to consider a general tramway scheme for Northcote, which might link up with lines in Brunswick, Coburg and Essendon.

Belfast.—A company is seeking to secure the interest of the directors of the old tramway company in order to run a new service from the Square, Warrenpoint, to the Quay, Rostrevor, by means of electricity.

Bolton.—In connection with the relaying of certain track, it has been reported that it will be advisable to relay a length of 25 yards of the South Lancashire Co.'s tramways. The latter company has agreed to supply the material if Bolton will do the work, and the Bolton Tramways Committee has decided to do this.

Chile.— ELECTRIC RAILWAY.— A 2,400-volt direct-CINIC.—ELECTRIC KAILWAY.—A 2,400-voit direct-current line is being built between the Tofo mines and the port of Cruz Grande. The average gradient on the 15 miles of track is 1 in 33, and the total descent 2,000 ft. From a main power station containing three 3,500-K.V.A. and one 300 K.V.A. Curtis turbo-sets, energy will be transmitted at 22,000 volts to a sub-station contain-ing two three-unit 1,000-kW., 2400-volt synchronous motor-generators. The line is to be used for taking iron ore to the coast, and the three 110-ton locomotives first installed will be equipped for reconcretive control feeding nower back into the supply system for regenerative control, feeding power back into the supply system on down grades.

China.—RAILLESS TRACTION.—After being in use for only a few weeks, the system of railless cars, which was started in Shanghai by the Shanghai Tramway Co., has, it is announced, had to be suspended for the time being. The only road traversed by the vehicles was the Fekien Road, and when everything was promising well, it was found that the road foundations were in such a weak condition as to be unable to stand the weight of the care that weight of the condition is to be unable to stand the weight of the care that weight of the condition is to be unable to stand the weight of the condition is the weight of the condition in the weight of the condition is the weight of the condition in the weight of the condition is the weight of the condition in the weight of the condition is the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight of the weight The only way for the service to be re-started is for the road to be concreted, and it is hoped that in due course the thoroughfare will be rendered suitable for the new traffic.

Continental Notes.—ITALY.—In consequence of the inconvenience caused by the electric service in the Glovi tunnel, it has, says the Revista Tecnica d'Elettricità, been decided to resume the old steam service. This appears to be due to the unsuitable rheostats of the new 330 type of locomotive. Several of these locomotives have been made without being properly tested. Further trouble has a size been the appears of the several of these locations. trouble has arisen from the supply of energy from different sources, which apparently have somewhat different frequencies.

The Italian Public Works Department has granted an application

for a subsidised concession for an electric tramway between Asola,

Montanara and Cremona.

Ealing.—The T.C. has decided to request the London United Tramways Co. to remove all the unlighted centre tramway poles, 51 in number, and four centre poles carrying are lights; refuges to an approved plan are to be constructed at the bases of the poles retained, the Corporation agreeing to contribute £1,000 towards the coat of the removal of the poles and the construction of the refuges, the liability in connection with the postcarrying are lamps, and the proposed refuges, to rest with the company.

Glasgow.—The Tramways Committee recommends that the agreement with the Paisley District Tramways Co. for the running of the T.C.'s tramway cars from Hawkhead Road to Paisley Cross be renewed, and that as a basis of renewal an allowance of 15 per cent. on the present rate per mile be asked to meet working charges.

Huddersfield.—Several extensions and improvements to the tramway system are contemplated. The Kirkgate section is to be re-laid, and on the Egerton section the line is to be doubled from the top of Cemetery Road to Thornhill Road. The Longwood extension is also under consideration.

Hull.—The Tramways Committee has decided to give the drivers and conductors earning less than 30s. per week an advance of 3s., and those earning more than 30s. an advance of 2s. This will also apply to inspectors. The engineers and electricians will also be given an increase, as the Corporation is pledged to recognise the standard rate. These concessions will cost the department about £9,000 a year.

Ilford.—TRAMWAY FARES.—The Council has decided to levy a 1d. rate to meet the deficiency on the working of the to levy a 1d, rate to meet the deficiency on the working of the tramways. Mr. L. E. Harvey, the tramway manager, has reported on the question of fares, against the id. fare and in agreement with the universal 1d. fare which has proved so successful in South Shields, If the 1d. fare covers standing charges, plus a margin for working costs, it does not matter how far, within reason, the passenger is carried. Mr. Harvey made certain recommendations in regard to workmen's 1d. return tickets. The Council has decided to allow the fares to remain as at present.

London.—The L.C.C. has decided to grant an increase of 3s. a week, or 6d. a day, as from March 1st, to all officers and employés of the Council whose wages are less than 30s. per week.

-INCOME-TAX ASSESSMENT.—The T.C. has been recommended to appeal against income-tax assessments on "rent of tramways," amounting to £951, for the years 1912-15.

Lowestoft.—The engineer has been instructed to proceed with repairs to the tramway track between Church Road and Pakefield, at a cost of £300.

Manchester.—The Corporation has decided to offer a war bonus of 2s. per week to employés earning less than 40s. per week. The local secretary to the Tramway and Vehicle Workers' Union has been instructed to press for the 15 per cent. advance previously applied for.

South Lancs.—Owing to recruiting, the number of men carried on the South Lancashire Co.'s system in the early morning and afternoon is showing a material shrinkage. The company's system runs through a colliery area which has supplied over 12,000 colliery workers to the new Armies.

### TELEGRAPH and TELEPHONE NOTES.

Argentine.—For some time the United River Plate Telephone Co. had been suffering from the destruction of their subterranean lines, and eventually the police discovered two ex-employés of the company cutting one of the cables. They stated that they did it out of revenge for having been dismissed. The losses suffered by the company amount to about \$30,000. It appears that there was a gang of men engaged in doing the damage.—Review of the River Plate.

Provision for Telephones.—The Postmaster-General has written to the principal Architectural Associations to call attention to the importance of making adequate arrangements in the plans of large buildings for the installation at a later stage of telephone equipment. Provision should be made, as a minimum, for one 3 in. pipe from the public footway to the basement or ground floor and for cables to the other floors. It is also desirable that there should be a ready means of leading wires to the various rooms on the different floors,

### CONTRACTS OPEN and CLOSED.

#### OPEN.

Aberdare.—April 6th. U.D.C. Motor-generators or converters, one H.T. switchboard and L.T. panels, and one H.T. feeder pillar. See "Official Notices" to-day.

Australia. - Sydney. - March 23rd. One 150-ton electric revolving floating crane for Naval Dockyard, Sydney. Particulars from the Board of Trade Commercial Intelligence Branch, London.

Ayr.—The Corporation surveyor is to invite tenders for the extension of the engine-room at the electricity station for new plant.

Bray.—April 6th. U.D.C. Stores for electric light works. See "Official Notices" to-day.

Bridgend.—April 8th. U.D.C. 400-kw. steam alternator. See "Official Notices" to-day.

Burnley.- March 22nd. Electricians' work for the B. of G. Forms, &c., from Mr. J. S. Horn, Clerk, Union Offices

Carlisle. - March 31st. Corporation. Twelve months' supply of jointing materials, oils and general stores. Forms, &c. from City Electrical Engineer, Victoria Viaduct.

**Dundalk.** — March 23rd. U.D.C. Twelve months' supply of stores for the Electricity Department. See "Official Notices" March 5th.

Dundee.--March 29th. The Corporation Electricity Department invites tenders for stores.

Edinburgh.—March 29th. Corporation. Three, six or twelve months' supply of insulated cables, are lamp carbons, fuse boxes, meters, &c., for the Electricity Supply Department. Forms of tender (10a.) from the Electrical Engineer's office, Dewar Place.

April 12th. Corporation. Water-tube boilers for Portobello Supply Station. See "Official Notices" to-day.

Glasgow.—The Town Clerk (Mr. John Lindsay) has been authorised by the Electricity Department to advertise for tenders for stores (with the exception of coal) for one year from May 31st.

Greece.—April 15th to 28th. Greek Ministry of Communications. Supply and installation of (1) a central exchange and telephone system at Salonica, (2) a central exchange at Athens, (3) telephonic apparatus and accessories. Only firms who have carried out actual working installations in towns of 100,000 inhabitants may tender. Deposit £400. Local representation. Particulars in French can be seen at Board of Trade Commercial Intelligence Department in Lordon. Ministrate des Commercial Intelligence Department in London. Ministère des Communica-tions, Direction des Postes, Télégraphes et Téléphones, Athen-

Halifax. — March 26th. Electrical fittings for six months, for the B. of G. Mr. A. T. Longbotham, Clerk, 4, Carleton

Hove. — March 26th. Corporation. One 500-kw. mixed-pressure steam turbine, complete with D.C. 230/285-volt generator and surface condensing plant; also a battery of 115 accumulators. See "Official Notices" March 5th.

Hull.-March 20th. Corporation. Six or 12 months' supply of coal for the Tramways Committee. Forms, &c., City Engineer's office.

Kirkcaldy.—March 22nd. Corporation. Twelve months' supply of brass castings, pitch, iron castings, &c., for the Electricity and Tramways Committee. Forms of tender from Mr. O. F. Francis, Burgh Electrical Engineer.

Limerick. — March 26th. Corporation. Engine-room ores, &s. Forms of tender from Mr. E. B. Thornhill, Borough Electrical Engineer, Frederick Street.

London.—The L.C.C. is recommended to invite tenders from selected firms for the supply of an electric lighting main in connection with the lighting of the refuges on the Victoria

Embankment.

March 31st. L.C.C. Installation, 218 wiring points, 265 lighting points, at Derington Road Elementary School, Lower Tooting, S.W. See "Official Notices" to-day.

Manchester.—March 23rd. Corporation. One 650-kw. rotary converter and static transformer, for the Electricity Committee. Forms from Mr. F. E. Hughes, Secretary, Electricity

New Zealand.—Wellington.—April 80th. Supply of a three-unit exciter set, and 1,600-KW. generator for the Lake Coleridge Hydro-electric scheme. Specifications from the Public Works Office, Wellington.

Nottingham. — March 22nd. Corporation. Twelve months' supply of electrical sundries for the Tramways Committee. Forms, &c. (5s.), from Mr. J. Aldworth, General Manager, Beastmarket Hill.

Rosslynlee. - Midlothian and Peebles District Asylum, Rosslynlee, invite offers for supplying electric fittings, &c., for six months. The Clerk, 19, Heriot Row, Edinburgh.

- The municipal authorities of Babilafuente Spain. -(province of Salamanca) have lately invited tenders for the concession for the electric lighting of the town.

Swinton and Pendlebury.—March 19th. U.D.C. Cables, joint-boxes, bitumen and joint-box compound. See "Official Notices" March 5th.

Tenders have been invited for the installation of a storage battery at the refuse-destructor works, and for mains extensions.

Walthamstow.—March 24th. U.D.C. E.H.T. and L.T. switchgear and cables. See "Official Notices" March 12th.

#### CLOSED.

Ayr.—The Corporation has accepted the tender, amounting to £9,624, of the Macintosh Cable Co., Ltd., for cables.

Blackburn.-Messrs. Chamberlain & Hookham, Ltd., have received the contract from Blackburn for A.C. and D.C. meters for the next 12 months. The same firm's tender has also been

accepted by Whitehaven for meters for the ensuing year.

The Corporation Electricity and Tramways Department has placed a contract with Messre J. H. Tucker & Co. for ironclad

switches for the next 12 months.

Colchester. — The T.C. has accepted the following tenders for yearly supplies to the Tramways Department:-

Lighting fittings —Siemens Bros., Ltd.; Joslins, Ltd.,
Electrical equipments for tramcars.—G. W. Allsop; P. B. Jackson and
Co.; Le Carbone.
Overhead equipment.—Brecknell, Munro & Rogers; Andrew & Co.
Rubber and fibre.—Andrew & Co.; B I. & Helsby Cables, Ltd.
Car fittings and castings.—Stanford & Co.
Car fittings.—Malleable Steel Castings Co.; Tempered Spring Co., Ltd.
Equipment & Engineering Co., Ltd.
Oils, grease, &c.—Joslins, Ltd.

Glasgow.—The T.C. Tramways Committee on Works and Stores has accepted the following tenders :-

Crane for Kinning Park sub-station.—Herbe:t Morris, Ltd. Stoneware ducts for cables.—Albion Clay Co., Ltd.

London.—HAMMERSMITH.—The Electricity Committee has authorised the placing of the following order for coal for the Electricity Department:

Harrisons (London).—Four barges (80 to 100 tons) of Yorkshire nutty, at 24s. per ton.

The undermentioned tenders have been received for the annual contracts for the Electricity Department:

Tenders were received for prepayment meters from the British Thomson-Houston Co., Ltd.; Messrs. Ferranti, Ltd.; Messrs. Landis and Gyr, Ltd.; and the B.I. & Helsby Cables, Ltd. The tender of Messrs. Ferranti, Ltd., is recommended.

The Electricity Committee recommends the Council to authorise the purchase of a further stock of coal for use at the electricity works up to a maximum of 3,000 tons.

KENSINGTON.—The Guardians have been recommended to accept the tender of the General Electric Co., Ltd., at £38, for six months' supply of electric lamps. Other tenderers were :-

BERMONDSEY.—The B.C. has accepted tenders for annual supplies from the following:-

Meters and time switches.—Chamberlain & Hookham, Ltd.
Meters, cut-outs, fuses, &c.—General Electric Co., Ltd.
Meter boards.—Ferranti, Ltd.
Cable.—Chas. Macintosh & Co., Ltd.; General Electric Co., Ltd.
Insulating box compound.—Dussek Bitumen Co.
Carbors and brushes.—Morgan Crucible Co., Ltd.
Conduits.—Thomas Wragg & Sons, Ltd.
Steel frames, covers and joint-boxes.—Sykes & Sugden.

Steel frames, covers and joint-boxes,—Syses & Sugden.

St. Marylebone.—The Electricity Committee recommends the acceptance of the following tenders for annual contracts:—

Flexible cords, fuse wires, &c.—Pirelli, Ltd.; British Electrical Mig. Co.; London Electric Wire Co.; B.I. & Helsby Cables, Ltd.

Underground cables.—Pirelli, Ltd.

House cables, box compounds and insulation.—L. Andrew & Co.; R. Blackwell & Co.; British Electrical Mig. Co.; B.I. & Helsby Cables, Ltd.; Dussek Bitumen Co.; J. North Hardy; J. G. Ingram & Bons; North British Rubber Co.; Pirelli, Ltd.

The Committee Programment that the two does of Monage.

The Committee recommends that the tender of Messr. Chamberlain & Hookham (agents, Messrs. Venner) be accepted for the supply of 1,000 meters, as required, on the same terms as last year, plus 7½ per cent., owing to the increased cost of materials and wages; also that the offer of the Tudor Accumulator Co. for the supervision of their batteries, at £85 per annum, be accepted.

Lowestoft.—The offer of Messrs. Rowlands & Co. to supply one dozen gear wheels at £3 6s, each has been accepted by the Tramways Committee,

Middlesbrough.—The Corporation has accepted the tender of Meears. Siemens Bros. Dynamo Works, Ltd., for the supply of Wotan and Tantalum lamps for the ensuing 12 months.

Sevencaks.—The U.D.C. has accepted the tender of Messrs. L. H. Russell & Co. for installing the electric light over the interior of the swimming baths.

Southampton.—The T.C. has agreed to extend for a further period of 12 months the contracts of the following firms for supplies to the Electricity Department:

Doulton & Co.—Pipes.
B.T.H. Co.—Meters.
W. Rickard, Ltd.—V.B. cable (six months).

The following offers have been accepted for supplies of coal:-A. Usher & Co.—ti0 tons Cannock old coppice, 21s. 9d. per ton. Cory Bros. & Co.—500 tons Piexton slack, 21s. per ton. Bradbury, Son & Co., Ltd.—250 tons Tamworth beans, 18s. 4d. per ton.

South Africa. - South African Railways. tender of the S.A. General Electric Co. has been accepted for the supply of electric incandescent lamps.—S.A. Mining Journal.

St. Albans.—The tender of Messrs. Giffen Bros. has been accepted by the Guardians for wiring the Infirmary for £16 10s., and the Board-room block for £31 10s.

Wakefield,-Yorkshire (West Riding) Electric Tramways Co, Ltd., has placed a contract for single-phase house service meters, for a period of two years from March 1st, with the Electrical Apparatus Co., Ltd.

### NOTES ON COAL STORAGE.

#### [COMMUNICATED.]

THE great increase in the size of central stations, and hence in their rate of fuel consumption; the importance of the service which they render as a "public utility," which must be maintained continuously; the high normal price of coal, and the readiness with which quotations soar upwards on the slightest pretext-all these factors make the problem of coal storage one of special interest to every central-station The problem is of equal interest to colliery engineer. From their opposite standpoints, both producer and user wish to maintain a stock covering emergency demands and delay in delivery, preventing as far as possible interrupted supply and broken contracts during periods of labour trouble, and taking advantage of market or seasonal fluctuations in price.

Seeing that 1,000 tons a week is now quite a commonplace consumption for a central station, and 1,000 or 1,500

tons a day is not unknown in large stations in the States, it is clear that the storage of 12, 10 or even 6 weeks' coal supply is no small matter. Storage on the largest scale has been practised in America; indeed, it is estimated that storage capacity is available for 10 to 12 per cent. or more of the annual coal production in the States. Some of the individual stores are very large, for instance, the Lehigh Coal and Railway Co. has storage for some 13 million tons, and a number of other companies for over half a million tons apiece.

Unfortunately, coal does not improve with keeping, but opinions differ considerably as to the extent by which it deteriorates, and as to the means most likely to preserve it economically. Having got some thousands or tens of thousands of tons of coal, preferably at a time when the market price is down, what is the best means of preserving the fuel? Three methods of storage at least are available. The coal may be piled in stacks, in the open or under cover; or it may be put in bunkers; or it may be placed in tanks which are then filled with water. Bunker storage is limited by considerations of capital cost to relatively small amounts of coal, but is specially convenient for temporary storage, e.g., holding a day or two's supply for the washeries of a colliery or holding fuel on its way (through the bunkers) to a boiler installation. The cost of a tank store is less than that of an equal over-ground bunker capacity, and is justified in very much larger sizes by the advantages of wet storage. Ordinary pile storage is the simplest and cheapest system, but it exposes the fuel to "weathering" action, the effect of which is to weaken the coal mechanically, reduce its heating value, and introduce a certain risk of spontaneous combustion.

The effect of atmosphere and weather on coals was examined very thoroughly by Lecrivain, two or three years ago, and was found to consist, in greater or less degree, in all coals, of surface oxidation, causing cracks which gradually extend through the pieces, disintegrating them, and exposing fresh surfaces. A preliminary loss of weight, due to drying and escape of fire-damp (methane), is followed by a gain in weight due to oxidation, and then a further loss due to formation, by decomposition, of volatile hydrocarbons, which escape. Spontaneous ignition generally follows rapidly

on the last-named stage.

Lecrivain's tests on French coals showed as much as 30 per cent. loss of gas value (and corresponding reduction in calorific value) in a month, and 50 per cent. reduction in three months in the quantity of ammonia by-products recoverable. These losses are higher than generally experienced, but it is not unusual to find 10 or 20 per cent. of the gas value of a coal lost by air storage, and if such coals be used for boiler firing, proportionate loss in steam-raising value is, of course, experienced. (The "gas value" is about 5 per cent. of the total calorific value.)

Tests conducted recently by the U.S. Navy Department showed that the slack New River coal, which deteriorates not at all under water, loses about 1 per cent. in calorific value during 12 months' exposure to weather; larger grades suffer less loss. Coal in a 120-ton pile on the Isthmus of Panama lost less than 0.4 per cent. in heating value during a year's weathering, and was not disintegrated or otherwise damaged physically. On the other hand, black lignite lost 3.5 per cent. heating value in three months, and 5.3 per cent. in three years in outdoor 3 to 6-ton bins. As might reasonably be expected, the loss in calorific value is several times greater in lignite coal than in hard steam varieties. From average steam coals there occurs soon after mining a loss of gas representing 0.1 to 0.2 per cent. of the total calorific value. The escape of this gas is at least as serious from the explosion risk it introduces as from the standpoint of calorific value. Coal which exhales much gas should be seasoned for a few weeks if possible before stacking.

Moisture and freezing are particularly injurious to coal which has a tendency to cleave, especially if it has begun to do so owing to rough handling and surface oxidation. In severe climates the freezing of exposed piles in winter is a serious consideration, and dynamite has had to be used before now to get coal in winter from open stacks in the Alternate dryness and dampness is particularly injurious, hence coal should either be submerged completely or stacked in piles which do not favour the accumulation and

gradual evaporation of moisture. The disintegrating effect of weather is, of course, greatest near the surface of piles. The smaller the coal the less the penetration of weathering, the effects of which are generally most marked in an outer layer 1 or 2 ft. thick.

As shown later, the one or two per cent. loss of calorific value in weathered coal is saved by wet storage, but at the cost of roughly the same indirect loss due to the wetness of the coal as fired. This being so, the chief argument in favour of wet storage is the elimination of fire risk. Experiments conducted last year in Yorkshire show that oxidation of fine coal exposed to the atmosphere may easily proceed fast enough to cause cumulative temperature rise at the rate of  $\frac{1}{2}$ ° F. per diem, assuming that no heat escapes, which is at least approximately true in the centre of a large coal heap to which there may nevertheless be sufficient air access for oxidation to occur. As the temperature rises, the rate of oxidation, and therefore of heating, increases. At about 160 or  $170^\circ$  F. the heat of oxidation is absorbed completely in evaporating moisture. During this period the coal steams freely and its temperature remains constant; thereafter heating is liable to proceed quickly and spontaneous combustion to occur. Under suitable circumstances, easily attainable in large heaps, the presence of moisture may actually accelerate spontaneous heating, moisture evaporated from the parts first oxidised condensing on and thus warming other surfaces.

Dust and smalls naturally heat up more quickly than lump stacks. Warm, moist climates favour rapid oxidation. The presence of pyrites in coal is particularly dangerous, and so is the oily nature of some varieties. The accumulation of heat to any dangerous degree cannot occur in very shallow stacks. In deep stacks special ventilating pipes or ducts are sometimes provided, but in the event of self-heating commencing, these passages may aggravate the danger by gently fanning the incipient flame. From 10 to 20 ft. is considered the limiting desirable depth for dry coal heaps in England and France, whether in the open or under cover. Besides the overheating danger, it is considered that explosible dust pockets are liable to form in deeper piles. In American storage fields, piles up to 80 or 90 ft. in height have been built with anthracite, but bituminous coal is found to be badly crushed and subject to decomposition and overheating risks if piled more than 35 ft. deep.

Big lumps rolling down an open-air stack are apt to form channels round its base which act like the air ducts in a charcoal-burner's heap, and increase the risk of spontaneous combustion, particularly if there is in the centre of the heap a mass of small coal liable to overheating. Fine coal should not be stacked when avoidable. If, as is generally the case in modern central stations, a slack coal is used on chaingrates, the reserve coal stock should either be kept under water (in which case it is wet and messy to stoke), or should be of fairly large grade and crushed as and when required. Since the reserve can be held (particularly under water) for very long periods without serious deterioration, the second alternative is not extravagant, for the more costly lump reserve coal is crushed only once in one or several years, emergencies excepted.

Storage under water, whether fresh or salt, undoubtedly dces preserve the calorific value of coal almost indefinitely. It is sometimes said that it renders coal brittle, and no doubt fuel subject to easy cleavage is weakened by long immersion, water seeping into minute cracks and then, by its lubricating action and hydraulic rigidity, facilitating breakage. Freezing, has, of course, a bad disintegrating effect on coal containing water in its fissures. On the other hand, the buffer effect of the water in which the coal is stored reduces breakage in dumping and grabbing, so that the net effect as regards breakage is probably rather favourable than otherwise. The chief value of water storage lies, however, in preventing spontaneous combustion, and it is a fortunate though natural coincidence that those coals in which the risk of spontaneous combustion is greatest, are also those which deteriorate most by weathering, and, therefore, benefit most in this direction also by sub-aqueous storage.

The first large under-water coal store was the 10,000-ton tank built by the Western Electric Co. in Chicago 13 years ago. Since then many others have been built for

industrial and navy use, but more in the States than in Europe. The general construction resembles a swimming bath (but of uniform depth) spanned by a travelling grab crane and loaded by a travelling tower and shoot, or by grab crane. The reinforced concrete tank in which the Omaha electricity works stores 10,000 tons of coal measures  $100 \times 116 \times 22$  ft., and, in addition to the main reinforcement, a number of old rails are sunk flush in the concrete bottom to prevent the grab bucket from injuring the latter by impact or scraping. Since only constructional costs limit the depth to which wet storage tanks may be excavated, it is possible to store safely and indefinitely more coal per acre under water than in dry stacks.

A fact which is often overlooked is that wet storage generally means firing wet coal. Fine coal naturally retains more moisture than larger grades, and with it wet storage is at once most desirable and most messy; with it, the sticking and general messing-up of mechanical stokers is most troublesome when the coal is wet, and with it the loss of heat required to evaporate moisture in the fuel is most Even the ordinary amount of moisture in coal, serious. which is nominally dry, accounts for  $\frac{1}{2}$  to 1 per cent. of the calorific value of coal, i.e., for an amount of heat which is of the same order of magnitude as the loss in calorific value of medium-sized hard coal, during some months' weathering. Where water pans are used in the ash pits of a boiler, 3 or 4 per cent. of the heat value of fuel may be absorbed in evaporating moisture therefrom, but this expenditure is considered justified by the compensating advantage of smokeless combustion and increased available heat in the combustion chamber. The same result is not secured, at any rate so efficiently, by using wet coal, for the fresh fuel dries before it becomes incandescent, and the steam liberated escapes without passing through the fire, i.e., without experiencing that dissociation and recombination on which the advantage of wet ash-pans or special steam jets depends. After prolonged immersion, some coals will hold as much as 5 to 15 per cent. additional water, after the longest draining that can reasonably be given. If the calorific value of the fuel be 14,000 B.TH.U. per lb. and the water content be 15 per cent., its evaporation (requiring about 1,000 B.TH.U. per lb. of water) will absorb 1.1 per cent. of the heat value of the coal, and may thus constitute as serious a loss as the loss of calorific value which would follow storage in open-air piles. It is in preventing decomposition and possible ignition by spontaneous heating that water storage is most valuable.

Coal storage by producers, to form a shipping reserve, or under compulsion by transport deficiencies or a flooded market, is generally for short periods only; a certain amount is always in store, but it is not the same coal throughout. On the other hand, storage by a large consumer is to form a real emergency reserve, and if the coal be stored under water it can be kept almost indefinitely. long as it can be taken out as fast as it is required in emergency, there is no need to sacrifice anything to convenience of filling and emptying, and where land is valuable there is no reason why buildings should not be erected over the storage tank, using conveyors for loading and unloading. The latter do not need much headroom, and by handling the wet coal in a thin continuous stream, it is given most opportunity to drain before use. In such installations a certain working reserve of fuel should be kept in an open stack or, usually, in overhead bunkers filled straight from trucks on a railway siding. The cost of water storage equipment is not excessive, and is practically limited to that of the tank itself. The filling and emptying pumps need not be very powerful, and their cost is at least saved on the coal-handling gear, for this has to extend over a smaller area than where open storage is practised.

The cost of a complete mechanical coal-handling equipment is justified by the less breakage of fuel, by its more expeditious handling, and by the saving in labour costs. The mere fact that an extensive coal plant can be controlled by one or two men is specially important to central stations in times of labour trouble. The telpher system is cheap, convenient in operation and flexible in application. It permits of continuous and practically automatic working. The coal routes can be adapted to any shape of yard in any stage of filling. A travelling terminal bridge with adjust-

able trips permits coal to be placed or removed just where desired, and one or two men can operate an equipment conveying 60 tons an hour over a mile or more. In the new Bordeaux harbour works, for instance, a double aerialtransporter system carries coal 11 miles from the wharf to railway yards and warehouses, &c., where it delivers into shoots on a terminal tower. Thence the coal falls into trucks or on to a belt conveyor running along a travelling gantry, and spreading material evenly all over the pile. buckets, of 20 or 30-cwt. capacity, on the gantry, provide for subsequent collection of the coal. The tipping transporter buckets run on an overhead cable or rails, and are towed by an electrically-driven tractor cable at nearly three miles per hour. Up to 200 tons an hour is handled by each transporter (4,000 tons a day total) by this all-electric equipment.

In the case of a station served by river or canal and railway, there are five coaling operations to be provided for, viz., from waterside to boiler house or storage, from sidings to boiler house or storage, and from storage to boiler house. Experience in the national coal strike a year or two ago showed that aix or eight weeks' supply was the minimum coal reserve with which a central station should be provided, i.e., storage must be arranged for anything from 10,000 to 100,000 tons or more (the New York Edison Co. has 150,000 tons storage, besides overhead bunkers in its stations). Safety demands that the reserve be near the station, not only for convenience, but also because the "sympathetic" strikes of the twentieth century are apt to paralyse transport and coal supply simultaneously. On the other hand, it is not always possible to accommodate the vast reserve desirable, in yards immediately adjoining the station, for as shown by the following data (based on 45 cb. ft. per ton) over 2 acres would be required to store 60,000 tons in a stack 30 ft. deep (the limiting safe depth for dry stacks of most coals) :-

Depth of Pile.		Storage per Acr				
20 ft.	•••	•••	19,500 tons.			
30 "	•••	•••	29,000 ,,			
40 "	•••	•••	39,000 ,,			
<b>50</b> ,,	•••	•••	48,500 ,,			
80 ,,		•••	77,5 <b>00</b>			

To store even 20,000 tons requires a heap 600 ft. long, 50 ft. wide and 30 ft. high (or its equivalent), so that if land be dear or scarce round the central-station site, a few days' supply may be kept on the latter, and the remaining reserve within easy reach by private light railway or telpher system.

#### REVIEWS.

Experiments. By PHILIP E. EDELMAN. Minneapolis, U.S.A.: P. E. Edelman. Price \$1.50.

It is seldom that we have read so refreshing a book on Science as this little volume on "Experiments," by Mr. Edelman. The author sets out to give a "Complete account of experimental work in Science, invention, the industries and the amateur field, with practical illustrations and working directions," and if he has not succeeded in giving his "complete account," he has at any rate written a book at once suggestive and inspiring.

The volume is dedicated to "all those who have encouraged and contributed to the progress of experimental work," and the author has prefaced his book with an able essay on the value and need of experiments. He points out that progress only comes about through experiments, and that it would be difficult to think of even a few things that we possess that have not come to us by experiments; but at the same time he draws attention to the fact that a large amount of experimental work is being done by "hit-or-miss" methods, which naturally give meagre results for the time and energy expended; and he lays special stress on the advantage of possessing a sound knowledge of fundamental principles as well as experimental skill and resource. This volume comprises two distinct books, one part devoted to experiments which may be repeated, the other leading to new and original work.

Chapter I deals with models, copies and makeshifts, and describes the latent possibilities of old cans, jars, sticks, paper, string and glue in the production of working models. Chapter II consists of 12 sections devoted to simple experiments in chemistry, including the preparation and properties of common substances such as oxygen, hydrogen, water, ammonia, acids and sulphur. Then follow chapters in which most of the wonders of chemical technology find a place, e.g., thermit-welding, catalysis, electro-deposition and rubber substitutes. Electricity naturally occupies a considerable space in this book of experiments; a chapter is devoted to the construction of small electric motors, and the details of construction are so carefully given, that it would be difficult for the merest novice to fail to make a workable machine. Some very interesting experiments are also described on electric heating, welding, &c.

In Chapter XI, four of Faraday's experiments on electromagnetic induction are described, and the repetition of these classical experiments is suggested as leading up to other experiments on transformers, &c., to be described later in the book. There can be no doubt of the value of the repetition of fundamental experiments such as these, and if such a course were taken in other branches of science it would probably lead to a far better understanding of the fundamental principles. The more complicated and consequently less instructive experiments often performed in school laboratories could well be replaced by repetitions of the original experiments of Oersted, Volta, Faraday, and Maxwell.

Another chapter includes an account of the construction of a small transformer, a spark coil, an interrupter, and an ozonator, all of which are made of quite inexpensive and easily procurable materials, but which are, nevertheless, capable of doing good experimental work on a small scale. There is in Chapter XIII an account of how to make and use a small wireless station, and the author's reputation as a writer on wireless subjects naturally gives considerable weight to whatever he may say on this subject. To the description of the wireless telegraph is also added an account of a wireless telephone, which may be easily set up to operate over distances of 70 to 80 ft. In the remaining chapters of Book I experiments are described with Tesla coils and ultra-violet and X-rays; one section is devoted to Experimental Aeronautics, and the final chapter to Microscopic Photography.

From such a number of experiments it is difficult to make a selection; there is so much that is valuable and so little dross, that justice can only be done by reading the book from cover to cover.

Book II, which deals with the principles of research and invention, although occupying less than a quarter of the whole volume, is nevertheless a most interesting collection of suggestions and examples. The methods and principles of research work are carefully set out, and although it is obviously impossible to do more than merely point the way to successful researching, yet many pitfalls may be avoided and much time saved by following the very sound advice given in these few pages. Some chapters are added on Radio-research and Commercial Testing, which serve as examples of the general methods described earlier in the book.

It is interesting at this time to notice the author's opinion stated at the end of his book, that "Scientific endeavours are least affected by periods of military activity . . . and progress continues in spite of economic and destructive losses."

It is impossible to read this book without feeling an increase in "keenness," a passion for experimenting, and a desire to convert the "vast potential possibilities" into the "kinetic realities" mentioned by the author.—P. K.

Wireless Telegraphy. By RUPERT STANLEY, B.A. London: Longmans, Green & Co. Price 7s. 6d.

Though there are already a considerable number of text-books for students on the subject of wireless telegraphy, it will generally be conceded that Prof. Stanley's work is a welcome addition. It is arranged and written in a manner that will appeal well to the student and give him a useful

insight into the theory of the subject. This affords sufficient warranty for its appearance, and for the same reason parts of it will be examined in some detail in this review. It will therefore be understood that the criticisms made will, in general, apply rather to specific points than to the character of the work as a whole.

The symbols c and  $\kappa$ , for current and capacity respectively, are in general use throughout the book, in spite of recent conventions, but the reviewer is not disposed to quarrel with this, as it really seems a pity to try to upset such well established expressions as  $c^2 \kappa$  and  $1/2 \kappa v^2$ .

The second chapter is devoted to a brief consideration of matter and electrons, with the idea of imbuing the student with the electron theory of electrical phenomena, especially in regard to radio-telegraphy. Hence we learn that an electric current along a wire is nothing more or less than a flow of electrons along the wire, or from atom to atom in the wire. It is not clear to the reviewer how this conception is of real help to the deep-thinking and serious student, and it certainly appears to be one on which he is likely to ask some awkward questions. Thus, considering a linear oscillator whose linear dimensions are almost half the wave length given out, if the oscillating currents along. the conductor are alternate fluxes of electrons (which are negative charges of electricity according to the theory), then it is reasonable to ask if the positive charges at one end of the oscillator remain quiescent until the electrons from the other end reach them. If this one-sided explanation be conceded, then seeing that it takes a quarter period for the positive charges to be annulled, it follows that a movement of electrons along the whole length of the oscillator has occurred in the same time, thus postulating a mean velocity, including starting and stopping, of nearly twice the speed of light, and this in spite of the fact that electrons possess inertia. There are cogent theoretical reasons why the velocity of electrons may not exceed the speed of light as a maximum, and it would be interesting to know where the fallacy lies. student may well ask why, if the electrostatic field is made dissymmetrical in this way, the magnetic field is not also dissymmetrical. It will also be legitimate to ask how it comes about that the grounded loops of strain which form part of the propagated wave in an ordinary wireless system travel over the surface, seeing that one set of grounded extremities of the loops postulate positive charges on the surface of the ground. Do the negative charges push them These are only a few of the questions that would present themselves due to the assumption that it is only negative electricity in motion that constitutes a current. It is the reviewer's suggestion that while electrons (or, preferably, corpusoles") have a useful and well-defined place in the theory of the constitution of matter, the time is not yet ripe to assume that electric currents are in all cases electronic fluxes; and, further, that such assumption is liable to confuse the serious student. Just as the author of the book directs the student's attention to magnetic strain apart from the magnet which produces it, so it is possible to direct his attention to the electrostatic strain apart from the nature of an electric charge.

Another point of theory on which the author appears to deceive himself lies in the statement that a current can only flow in a wire when it connects two conductors which are charged to different electric potentials. But a current can be made to flow in a circular circuit by a changing magnetic flux without any difference of potentials.

In dealing with questions turning upon the conductivity of the upper atmosphere, the author seriously misquotes Sir J. J. Thomson (unless the reviewer is badly mistaken). The error is a very common one, hence there is all the more reason for pointing it out. The atmosphere at a certain stage of rarefaction is said to have better conductivity for high-frequency currents than sea water, and for this statement Sir J. J. Thomson is quoted as authority. Surely, what Sir J. J. Thomson's experiments showed was that rarefied gas when violently ionised and in disruptive activity through electric stresses of relatively prodigious intensity, possessed this degree of conductivity. If the whole of the upper atmosphere were rendered intensely luminous by electrical activity then we might expect the degree of conductivity referred to.

In the more practical part of the book there are a few points on which comment might be made. Thus the author dwells too much on the need for winding secondaries of spark coils used for charging condensers with comparatively thick wire. There is not so much in the argument as the author appears to think, and it would possibly appeal better to the student if the limitation of condenser voltage were considered rather from the point of view of energy transference from the magnetic field of the spark coil to the charged condenser.

In regard to the question of coupling, the author appears to hold the fallacious view that if energy can be prevented from returning into the closed circuit of a coupled sender, then the radiation of a pure wave length is assured. The assumption apparently is that coupling waves are given off in succession, and this appears to be the view adopted by many. It will hardly be necessary to point out to any mathematical student that the Fourier series is the same, whether we wait till the energy begins to return to the closed circuit or consider only the initial part of the radiation. Out of this fallacy there has been an attempt made to claim special qualities for certain disk discharger transmitters. It is unfortunate also that the author follows the wrong lead given by certain wireless experts in assuming that because a spark gap is shortened the spark resistance is necessarily less. The reverse is probably more frequent, as witness quenched spark transmitters.

Telegraphy—Preece and Sivewright. New edition; revised by W. LLEWELLYN PREECE. London: Longmans, Green & Co. Price 7s. 6d.

In its new edition this well-known text-book has been largely revised and extended, with the object of embracing more recent advances in telegraphy and telephony. The work of extension and revision has been undertaken by Mr. W. Llewellyn Preece. New chapters have been added on the Baudot system, on comparative results obtainable with high-speed telegraph systems, and on secondary batteries. Practically all other chapters have been very much revised. Those on telephony and on wireless telegraphy are stated to be of a purely introductory character.

The work is well got up and forms a very presentable volume. In the matter of bringing up to date it is in some respects disappointing. In one or two cases modern forms of apparatus or appliances have not been referred to. Thus, old-fashioned forms of Wheatstone ABC apparatus are fully described and illustrated, whilst more efficient modern forms are not alluded to.

The chapter on secondary batteries is marred by inexact methods of expression. For instance, it is stated that the internal resistance of accumulator cells does not exceed '0015 ohm, without allusion to limitations imposed by the dimensions of the cells or other factors, and a definite figure for density of electrolyte when a cell is discharged is given without reference to the quantity of electrolyte in relation to the capacity of the cells. Nor is it made clear why "more distinct signals" are obtained as a result of using accumulators for telegraph purposes. A reference to the matter of working costs, as compared with primary batteries, would not be out of place. In regard to the chapter on telephony, it is observed that no explanation of working principles of speech transmission on central-battery methods is attempted, though a number of figures are given, and the signalling arrangements are explained in some detail. In figure 206 a distinctly objectionable method of jointing paper-insulated cable wires is illustrated. On page 229 a heat coil is most inadequately described as a small coil which fuses should a heavy current flow on the line. From these examples it will be seen that the work is capable of much improvement.

The section on wireless telegraphy cannot be commended. Admittedly a large amount of ground is not covered and the matter given is only intended as introductory, but many of the statements made are open to a considerable amount of criticism. Thus, on page 373 an inaccurate definition of coupling is given in which the term is made to refer only to the windings of the "jigger," whereas it embraces he whole primary oscillation circuit on the one hand, and

the whole aerial oscillation system on the other. Of these the "jigger" is usually but a small part. Again, in explaining the early Lodge method of shock excitation on page 368, reference is made to the closed-circuit oscillations being quickly damped (why, is not apparent) and to the aerial circuit being free to oscillate, having but little inductance. Nor is it at all clear upon The italics have been added. what grounds the statement is made that the Marconi transmitter in its later developments is "an extremely close approximation to the ideal requirements of a transmitting wireless station." It is more than doubtful whether there are any extremely close approximations to the ideal in wireless telegraph transmitters at present.

#### FORTHCOMING EVENTS.

Institution of Mechanical Engineers.—Friday, March 19.h. At 8 p.m. At Storey's Gate, S.W. General Meeting.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, March 19th. At 7.30 p.m. At Bolbec Hall, Newcastle-upon-Tyne. General Meeting.

Association of Mining Electrical Engineers (West of Scotland Branch).— Friday, March 19th. At Royal Technical College, Glasgow. Paper on "The Use and Abuse of Oils in Connection with Electrical Plant," by Mr. T. C. Thomsen.

(Notts, and Derbyshire Branch).—Saturday, March 20th, At 3.30 nm. At University College, Nottingham. Papers on "Turbine Pumps or Colliery Pumping," by Mr. R. H. Willis, and "Utility of Surface Larthing on Armoured Systems," by Mr. W. Webster.

Electro-Harmonic Society.-Friday, March 19th. At 8 p.m. At Holborn Restaurant. Smoking Concert.

North-East Coast Institution of Engineers and Shipbuilders,—Friday, March 19th. At 7.30 pm. At the Lecture Theatre of the Literary and Philosophical Society, Westgate Road, Newcastle-on-Tyne. Paper on "The Future of British Engineering and Shipbuilding," by Mr. E. W. Fraser Smith.

Association of Engineers-in-Charge.—Thursday, March 25th. Visit to the House of Commons, Engineering Department.

There will be no meeting on March 27th.

Institute of Marine Engineers.—Tuesday, March 29rd. At 8 p.m. At Tower Hill, Minories, E.: Paper on "Comparative Efficiency of Lubricants," by Mr. J. Veitch-Wilson.

Institution of Electrical Engineers.—Thursday March 25th. At 8 p m. At Victoria Embautment, W.C. Paper on "Telephone Troubles in the Tropics," by Mr. W. L. Preece.

(Manchester Local Section).—Tuesday, March 28rd. At 7.30 p m. At Engineers' Club, 17, Albert Equive. Paper on "Electric Cooking, mainly from the Consumer's Point of View," by Mr. W. R. Cooper.

Royal Institution of Great Britain,—Friday, March 26th. At 3 p.m. At Albemarie dares, W. Paper on "Experiments in Slow Cathode Rays," by Prof. Sir J. J. Thomson, F.R.S.

Saturdays, March 20th and 27th. At 3 p.m. Lectures (V and VI) on "Recent Researches on Atoms and Ions," by Prof. Sir J. J. Thomson,

Physical Society of London.—Friday, March 26th. At 5 p.m. At University College, Gowst Street, W.C. Paper on "The Change of Thermal Conductivity with Fasion," by Prof. A. W. Porter, F.R.S., and Mr. F. Simeon.

#### NOTES.

Correction.—In our last issue under "Official Returns eoffection.—In our 1831 1880e under "Official Returns of Electrical Companies," appearing on page 364 we, by a printers' error, which we regret, reported the debentures of the E. S. Co., Ltd., as £20,000, instead of £2,000. Our readers will remember that in our notice of the registration of the company (Elec. Bev., February 12th) we correctly reported the capital of the company as £2,000. The operations of the company were further referred to in our issue of February 19th.

Electro-Harmonic Concert,-We wish to remind our readers that the last of the Electro-Harmonic Society's concerts for the season takes place to-night at the King's Hall, Holborn Restaurant. The large and enthusiastic gatherings at all the events of the season so far have proved that the Committee did not err in considering that electrical men wished the concerts to be kept running as usual as a relief from the stress and strain of these serious times, and it is hoped and believed that to-night there will be a large and representative company present to meet their friends and to enjoy the varied and appropriate programme their friends and to enjoy the varied and appropriate programme that has been prepared. Sir John Snell will be in the chair.

Trade Announcement.—Messrs. Estler Bros. are temporarily closing their office at Dowgate Hill, E.C., from Monday, March 22nd, and their sole office in London will be at the works, South Molton Road, Victoria Docks, E. Telephone Nos.: "East 820" and "East 4070"; telegraphic address, "Isolable, London."

Patents and Alien Enemies.—In connection with the Thermit process for welding rails in Australia, Mr. Hughes, the Atterney-General, has suspended the Goldschmidt patents in Tayou. The Engineer-in-Chief of the Commonwealth railways. The Born of Trade has granted a licence to Messrs. E.i. Bennis and Co., Ltd., A respect of Patent No. 8966/1903, granted to Bousse.

Late Legal.—British Insulated & Helsby Cables, Ltd. r. CRITTALL.—The concluding stage of the hearing of this case, which is reported on page 389, was reached on Wednesday, when Mr. Greer, K.C., counsel for the plaintiffs, completed his comments upon the whole of the evidence. The Official Referee said that owing to the nature of the case, and its length, he would have to take time to consider his judgment and put his decision in

THE ARC LAMP CARBONS CASE.—Mr. Justice Eve, in the Chancery Division on Wednesday, March 17th, heard an action by the Beck Engineering Co., Ltd., and A. M. Billington, against the Sloan Beck Engineering Co., Ltd., and A. M. Billington, against the Sloan Electrical Co., L'd., for a declaration that they were entitled to a stock of about 218,000 carbons for electric arc lamps lately stored at the Foster Engineering Co.'s premises at Wimbledon, and an injunction restraining the defendants from disposing of them. The defendants counterclaimed for damages in respect of an alleged trespass on the Foster Co.'s premises when the stock of carbons was removed by the plaintiffs. The Foster Co. were originally defendants, but were dismissed from the action last Oxtober.

The plaintiffs' case was that they had an agreement with the defendants, who acted as agents for a Mr. Conradty, of Nuremberg, a maker of carbons, to keep a stock of carbons at Wimbledon from which they could draw in connection with the making of the Beck electric flame lamp, and that upon the cancellation of the agreement they were to be at liberty to purchase the stock at the current price. The question was what was the meaning of the phrase "current price."

current price. The question was what was the meaning of the phrase "current price."

His Lordship held that "current price" meant the price ruling at the time the carbon was taken from stock and sold, and not at the time the carbon was taken from stock and sold, and not the carbon was taken from stock and sold, and not the carbon was taken from stock and sold. the price agreed upon between the parties two years ago. He dissented from the view that the purchaser was to have the right for the duration of the agreement to insist upon having his goods at a price which might mean making them at a loss. He dismissed the action with costs, and said it really should have been brought against the German maker. He also dismissed the counterclaim on the ground that the Foster Co. were not bailees of the goods for the defendants, but for the plaintiffe or the maker.

Appointments Vacant.—Switchboard attendant (25s.), for Stretford U.D.C.; switchboard attendant (38s.), for Portsmouth Corporation; junior assistant (888), for Sheffield Electric Supply Department; switchboard attendant (32s.), for Burnley Corporation; electrical fitters (39s), for drawing office, H.M. Dockyard, Portsmouth; switchboard attendant (27s.), for Wakefield Corporation. See "Official Notices" to-day.

ing of this Committee it was reported that there had been a further demand for the *Electric Vehicle* journal; the main feature of the June issue will be "The Municipal Uses of Electric Vehicles."

The General Electric Co. has been appointed the official manufacturer to the Committee for 12 months, from April 1st, for the illuminated type of charging station signs, and the Patent Enamel Co., of Selly Oak, Birmingham, has been appointed the official manufacturer for the same period for the enamel plate

type.

As to the standardisation of metal-filament glow lamps for use on electric vehicles, the Committee has had before it samples of fittings, and in view of the restricted amount of room has decided to recommend, as standard for electric vehicles, the lamps of the to recommend, as standard for electric vehicles, the lamps of the size and voltage recommended by the Engineering Standards Committee (Report No. 69). These lamps are for a pressure of volts and, in view of the small energy consumption and the comparatively short hours of use, the Committee recommends that, for the present, they be coupled across such a number of cells in the vehicle as will give the required voltage, and that a special extra terminal be provided on the cells for this purpose.

The Technical Sub-Committee is still engaged in drawing up a report as to the methods of charging and standardisation of charging equipments.

charging equipments.

The secretary was directed to write to those London municipal and company undertakings charging more than ld. per unit for "off-peak" supply, expressing the hope that they will reconsider this matter and come into line with the large number of supply undertakings which have already adopted the Committee's standard

Fatality.—SHEFFIELD.—An inquest was held on 10th inst, into the death of Walter Carley, a lai of 14 years, who was on the previous Sunday fixing an electric light outside his brother's on the previous Sunday fixing an electric light outside his brother's scullery in Attercliffe Road. He had been apprenticed for five or six weeks to an electrician. His brother tried to dissuade him from attempting the job. After the work had been finished, his sister-in-law heard a cry and found him hanging from the wire by his arms and with a pair of pliers in his hands. One of his legs was in a water tub and the other was drawn up. An employé of the Corporation electricity department said that the voltage was 200, and if deceased had caught the wire with the pliers the pressure would have sufficed to kill him. The boy had no right to be doing the work. The rules showed that the electricity department must be notified when any work of the sort was to be done, and the work had to be reported when completed, but in this case no notification had been sent. The wire was not the proper wire for the purpose, and the work had not been carried out properly. The Coroner said that apparently it was a fairly simple job, and had been completed, but carelessness afterwards in interfering with the wire while alive caused the death. A verdict of "Accidental death" was returned.

Electric Cooking at the Bradford Kursaal.—As briefly reported in our last issue, the Bradford City Council last week opened the Kursaal with the first electrically cooked dinner on a large scale that has taken place in the city; the plant was installed by the officials of the Bleotricity Committee, and was supplied by the Brompton and Kensington Accessories Co., Ltd., London, with the exception of a geyser and towel rails that were supplied by the British Electric Heater Co., of Glasgow. The is controlled by three heaters which may be used singly or collec-

tively, taking 4.5 kw.

One fish or potato frier made of blue planished steel with bright mouldings, and having a compartment 2 ft. × 18 in. and of ample depth. This is fitted with two heaters taking 4 kw., and is controlled by four switches for easily adjusting the temperature of the fat in which the frying takes place. Grill.—This has a grilling area of 24 in. × 12 in., and is made of

cast-iron and fitted with grill guard, grilling grid and drip tin. The loading is 4.5 kw.

One 10-gallon nickel-plated copper hot water urn for drinking purposes, taking 3'5 KW.

One 10 gallon copper cylinder mounted on the wall, fitted with ball cock and water gauge for providing hot water for washing up purposes, pipes being connected to sinks for this purpose. This takes 6 KW.

Ground Floor Cufé.

One carving table and hot cupboard, measuring 6 ft. 6 in. × 2 ft. 6 in. × 2 ft. 9 in., mounted on castors, and fitted with three tinned copper carving dishes, 19 in. 14 in., with hinged covers, and four 7-in, nickel plated gravy and sauce pots. The hot cupboard underpots. The hot cupboard underneath has internal dimensions of 5 ft. 9 in. × 2 ft. 1 in. × 2 ft. high.

There are three regulations of heat provided with this apparatus, which takes 3.5 kW.

which takes 3'5 kw.

One double lined nickel-plated coffee or milk urn of five gallons capacity, taking 2'5 kw.

One 10-gallon hot-water urn for drinking purposes, 3'5 kw.

One bread toaster, having a toasting surface of 17 in. × 11 in., 2'5 kw.

One breakfast cooker, 2 ft. 6 in × 2 ft., containing two 8-in. boil-× 2 10., containing two c-in. boiling rings, one 6-in. boiling ring and one 11-in. × 8½ in grill, with a total loading of £6 kw.

One electric hot-water geyser.

fitted in the counter for providing hot water for washing-up purposes to two wash bowls, the amount of water being regulated. This takes 4 KW.

Middle Café.

This is fitted with one toaster (25 kw.), one hot-water urn (35 KW.) for providing water for drinking purposes, one coffee or milk urn (2'5 kw.), and one electric geyser (4 kw.), fitted to the wash bowls.

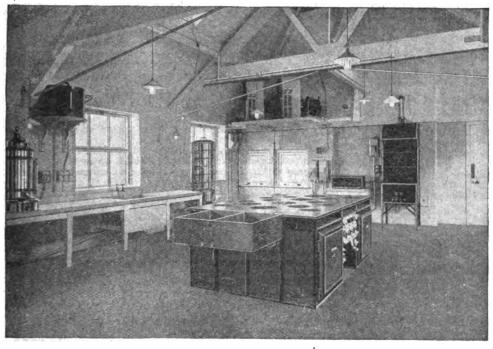

Electrically - heated towel rails, taking 150 watts each, are pro-vided in each of the cafés, in order to ensure a supply of dry towels always being on hand.

An American Carbon Co.-According to the American Electrical Review and Western Electrician, the National Carbon Co., which early last year took over the American Ever-Ready Co., subsequently operating its works as branches of the National Co., showed very satisfactory results in 1914. The company now has

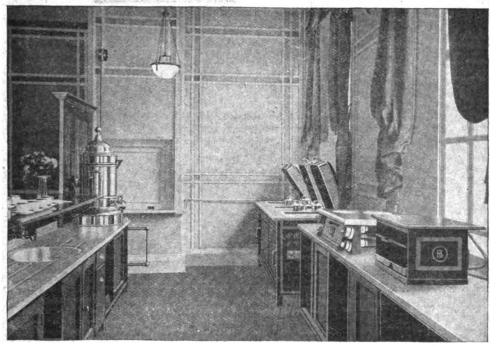

in 1914. The company now has ten factories in operation in the States and one in Toronto. A new factory has been completed at Jersey City, and a large one is completing in Long Island City. The profits are reported as equal to 26 per cent. on the common stock, as compared with 15 per cent. for 1913. The preferred and common stocks aggregated \$15,565,000, as against \$10,000,000. The profit advanced from \$15,665,000, as against \$10,000,000. The profit advanced from \$14,76,621 to \$2,215,880. The dividend distributed on preferred stock advanced from \$315,000 to \$372,750, and that on the common stock increased from \$330,000 to \$582,930. A bonus of \$25,000 was paid to employés as against nothing in 1913, and the surplus figures at \$825,618 as compared with \$495,907. \$195,907.

Board of Trade Assistance.—The Commercial Intelligence Branch of the Board of Trade has issued lists 10, 11 and 12 (for the weeks ended February 27th, March 6th and 13th) of articles which inquirers desire to purchase.

British firms interested, as suppliers, in any of the goods mentioned should communicate with the director of the Branch at 73, Basinghall Street, London, E.C.

INTERIOR OF THE MAIN ELECTRICAL KITCHEN, BRADFORD KURSAAL.

ELECTRICAL COOKING EQUIPMENT, GROUND FLOOR CAFÉ.

equipment is capable of cooking a table d'hôte dinner for 500 persons, and consists of the following items :—

One central range, fitted with bain marie, overall dimensions 9 ft. 3 in. × 5 ft. × 2 ft. 9 in. high, fitted with four ovens of 4 kw. each, and measuring 2 ft. high × 2 ft. 2 in. deep × 2 ft. wide; the frame is of cast-iron, stove enamelled black, with ground bright facings and bright boiling table.

The latter is fitted with four 2-kw. 12-in., six 1.5-kw. 10-in.,

The latter is fitted with four 2-kw. 12-in., six 15-kw. 10-in., and eight 1'2-kw. 8-in. boiling rings.

The ovens and boiling rings are arranged for three regulations, yiz., "high," "medium," and "low." The switches and fuses are mounted in conspicuous and easily accessible positions, and each oven and bolling ring has an indicator lamp to show when the convent is on current is on.

The bain marie is 2 ft. 8 in.  $\times$  1 ft. 9 in.  $\times$  6 in. deep, and is divided into two compartments, separately controlled by switches and fuses, and taking a maximum of 3 kw.

One circular steamer tinned inside and nickel-plated outside, 19 in, in diameter, with six 6 in. deep steaming compartments fitted internally with steam channels and draining holes. The steamer

Institution and Lecture Notes.—Institution of Electrical Engineers .- The opening meeting of the CALCUTTA LOCAL SECTION took place on January 28th, when the address of the chairman, Mr. W. H. Everett, was read by the vice-chairman, Mr. A. K. Taylor. The address dealt with the electrical industry Mr. A. K. Taylor. The address dealt with the electrical industry in India; it was shown that in the supply of apparatus and machinery for electric lighting and power the United Kingdom held by far the largest share, and telegraph and telephone apparatus and materials were almost entirely derived from this country. The total imports in 1913-14 exceeded one million sterling in value, the provinces of Bengal and Bombay providing 78 per cent. of the demand. The principal schemes in operation, or in progress in India were the following:— India, were the following :-

India, were the following:—
Water Power.—Tata Power Co., Bombay, 32,000 kw. (to be increased to 100,000 kw.); Cauvery Falls, Mysore, 12,400 kw.; Jhelum River, Kashmir, 4,000 kw.; Darjeeling, 2,500 kw.; Mussoorie, 1,900 kw.; Simla, 750 kw.; Jammu, Kashmir, 700 kw.; total, about 54,000 kw.

Steam and Oil.—Calcutta, 14,800 kw.; Calcutta Tramways, 2,900 kw.; Bombay, 9,000 kw.; Rangoon, 5,400 kw.; Madras, 3,800 kw.; Colombo, 1,550 kw.; Kolar Mines Co., 1,500 kw.; Dacca, 900 kw.; Dalhi, 840 kw.; Cawnpore, 850 kw.; Gwalior, 700 kw.; Lahore, 600 kw.; Kandy, 540 kw.; Mandalay, 520 kw.; Bikanir, 500 kw.; total, about 58,000 kw., of which about 1,800 kw. is generated by Diesel oil engines.

Power was being transmitted over distances up to 92 miles, at

Power was being transmitted over distances up to 92 miles, pressures up to 100,000 volts. The author estimated that the rainfall in the uplands represented something like 1,000 million H.P., and if only 1 per cent. of the total could be utilised commercially for the production of artificial fertilisers, the energy might be used for the production of artificial fertilisers, the electrification of railways and industrial power. In Calcutta already some 1,229 motors, aggregating 10,263 B.H.P., were in use for commercial purposes. Better provision was being made for the technical training of electrical engineers

of electrical engineers.

The following gentlemen have been nominated for the respective offies in the SCOTTISH LOCAL SECTION:—Chairman, Mr. D. A. Starr; vice-chairman, Mr. J. K. Stothert; hon. *ecretary,* Mr. Joseph Taylor; as-istant secretary, Mr. Wm. F. Mitchell; chairman of Students' Section, Mr. Arch. Page; Committee. Messrs. Wyatt (Greenock), W. W. Lackie, Prof. Maclean (Glasgow), Messrs. Arch. Wilson (Edinburgh), J. S. Nicholson, James Sayers, E. T. Goslin, George Stevenson, A. S. Hampton, and Prof. Cormack, Glasgow. The nominations will be confirmed at the annual general meeting in Glasgow next month. ge ieral meeting in Glasgow next month,

STUDENTS' SECTION .- The following further arrangements are announced for this session :

March Sist.—Discussion on the applications of electrical engineering to warfare:—"Searchlights and Projectors," to be opened by E. L. Emtage. April 14th.—J. M. Heslop. "The Electric Drive of Rolling Mills." April 19th.—Annual General Meeting. Lecture on "The Paragon System," by W. P. Durtnall.

At the meeting of the BIBMINGHAM LOCAL SECTION, on Wednesday last, Mr. W. R. Cooper read his paper on "Electric Cooking."

Birmingham Electric Club.—On Saturday last a lecture was given by Mr. W. E. Warrilow on "Electric Vehicles," which was illustrated by lantern slides. In the course of the discussion, Mr. W. A. Jackson (borough electrical engineer, West Bromwich) said that the petrol buses in his district had been commandeered by the Government; they got some more, but, fortunately, the Government took them also, and then they got Elison battery 'buses. The last were slower and more costly to buy, but, on the figures guaranteed by the makers, they would save £400 per annum over the petrol-driven 'buses, and he was confident that as a result of experience with them the West Brom wich Corporation would ultimately replace the horse-drawn vehicles used by the street cleansing departments with electric dust carts, &c. Mr. Hargreaves (Edison Co.) said he took three commercial vehicles a distance of 3 000 miles through the Midlands last summer and had experienced no difficulty in obtaining a charge. difficulty in obtaining a charge.

Municipalisation of the Berlin Electricity Works. It is officially announced by the Berlin City authorities that the "majistracy" decided at the meeting on February 23rd to proceed with the municipalisation of the Berlin Electricity Works. As a result of the course of events, it is said that room no longer exists for a conflict of opinion within the majistracy or for a decision of a majority against a minority in the matter. The lignite coal fields of Golpa-Jesmitz, which have been held in prospect by a company associated with the Berlin Electricity Works Co. and the A.E.G. for meeting the supply of energy for Berlin, are now intended for other purposes in the interest of the country, and no other solution therefore is presented than that of taking over the works for municipal administration. As a result of this aunouncement the city of Berlin will acquire the works on Ostober 1st next provided that the City Council itself agrees to the scheme which has just been placed before it for this purpose. It is, however, considered probable under the prevailing circumstances that as in the majistracy so in the Municipal Council circumstances that as in the majistracy, so in the Municipal Council itself, will there be a majority of votes cast in favour of the scheme. The present agreement expires in October, and in view of this fact the city has been in negotiation with the Berlin company for a long time past with the object either of securing considerably more favourable terms for supply and a larger share in the profits, or, if this were not possible, of taking over the undertaking. The question of converting the works into a joint private-municipal enterprise has been dismissed for practical reasons as well as on account of opposition offered to the suggested community of

interests, whilst the diversion of the distant lignite fields to the other objects has also placed a different complexion on the question. During the past few years the city has received from the company During the past few years the city has received from the company about £350,000 per annum as tax and share in the profits, and the decision to absorb the undertaking is based upon the assumption that the net yield to the city will be greater than this sum under municipal administration. It is calculated that the purchase price, which will be settled according to the book value on October 1st, will reach about £6,500,000; but the raising of the necessary money under existing circumstances will be difficult, whilst money is expected to be dearer after the conclusion of the war. The reference previously made to the extensive lignite coal fields of Golma-Jessnitz is explained by the fact that the company fields of Golpa-Jessnitz is explained by the fact that the company concerned has just entered into a contract of many years' duration for the annual supply of 500,000,000 kw.-hours to an undertaking which is to produce artificial fertilisers, and a second company is being formed which will require a further quantity of 250,000,000 kw.-hours every year.

London Electrical Workers' Demands.-We have received the following communication:

"The following is a brief account of a meeting of the London members of the Union :

members of the Union:—

"At a largely-attended meeting of the London members of the Electrical Trades Union it was decided by an overwhelming majority of those present, to press for an advance of wages of 1½d. per hour for all grades of electrical workers employed in the metropolis. The application presented to the London Electrical Masters' Association for one shilling per hour with a 48-hour week was ratified, and it was further decided that a special code of working rules for men engaged on ship work should be circulated to all employers in the Port of London.

"The wiremen employed on the London County Council tramways, both members of the Electrical Trades Union and nonmembers, struck work on Saturday last to secure the recognition of 10½d, per hour as the minimum rate. Should there not be an early

1011 per hour as the minimum rate. Should there not be an early settlement satisfactory to the men, it is stated there may be an extension in dispute. The London Electrical Masters' Association agreed with the Union that the rate for wiremen should be 101d. per hour as from July last. "J. POTTER,

" Die. Sec , Elec. Trades Union.

"Kilburn, N.W., March 17th, 1915."

### OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—Before leaving to take up his new appointment with the Pirelli Co., Ltd., MR. W. A. BROWN, who was the distributing engineer to the St. Paucras Borough Council for a period of nearly 18 years, was the recipient of an electric hot plate from the clerical staff, and a set of out-glass rose bowls from the men and staff of his department. Both presenta-tions were made by Mr. Sydney W. Bayner, the chief electrical engineer, who expressed the regret of all at Mr. Brown's leaving engineer, who expressed the regret or all at mr. Drown's leaving the service, and wished him every success in his new sphere. At a meeting of the Electricity Committee on the 11th inst., the Mayor (Alderman Joseph May), on behalf of the Committee, presented to Mr. W. A. Brown a silver stop watch suitably engraved, as a memento from the Committee, and spoke in highly complimentary than a spraines to the Committee. terms of his services to the Council.

The Bingley Council's Electricity and Tramways Committee recommended that the salary of the electrical engineer (Mr. F. C. PEDLEY) be increased by £30 a year, and that of the assistant engineer by £26 a year. The recommendation was, after discussions sion, adopted.

It is recommended that the salary of MR. H. A. KELL, chief esistant engineer at the Luton electricity works, be advanced by

£20 to £200.

The Stoke Newington B C. has been recommended to grant the following increases in the salaries of members of the staff of the electricity department:—MR. S. HANN, electrical engineer, £280 to £290 per annum; MR. H. LARGE, chief assistant, £130 to £140, to £290 per annum; MR. H. LARGE, chief assistant, £180 to £140, reserving for future consideration an honorarium for his services in acting as borough electrical engineer during Mr. Hann's absence with the Forces; MR. E. G. MACKENZIE, sub-station assistant, £2 to £2 2s. per week; MR. A. H. GAY, sub-station assistant, £1 15s. to £2 2s.; MR. A. E. COLLINGS, sub-station assistant, £1 15s. to £2; Mr. G. F. MALDEN, temporary sub-station assistant, £1 12s. to £2; MR. A. S. CUSHING, temporary sub-station assistant, £1 12s. to £1 15s., reserving further consideration of salary to take place after the lapse of six calendar months; MESSRS. FORD, RAYNER and LAWS, engine drivers, an addition of 2s. per week; ME. S. BONE, clerk, an addition of 4s. and MR. G. HODGES, night duty man, an addition of 2s. per week. man, an addition of 2s. per week.

Tramway Officials.—The Plymouth T.C. has, by 46 votes to 10, rejected the recommendation of the Tramways Committee regarding the appointment of Mr. C. R. Everson, mentioned

in the last issue of the ELEC REV.

Southampton Tramways Committee has received 48 applications for the post of tramways manager. The following candidates have

n selected for interview: -Mr. H. Pilling, Accrington; Mr. F. Buckley, Wigan; Mr. W. Billington, Salford; Mr. W. T. Robeon, South Shields Corporation tramways. A deputation has been appointed to visit the towns and to interview the selected candites where they are at present engaged, and report.

General.—The undermentioned have been appointed 

Robert Burleigh.

No. 5 Electric Lights Company; Alfred Thurston Taylor to be

second Lieutenant, March 17tb.

The Axbridge Board of Guardians has increased the salary of the sectrical engineer at the workhouse (Mr. F. C. HARRIS) from £80 to £100 a year.

MR. GEORGE SUTTON, M.I.E.E., managing director of Messrs. W. T. Henley's Telegraph Works Co., Ltd., has been elected to succeed the late Mr. J. F. Albright, as chairman of the Kent Electric Power Co., and MR. H. B. HARVEY, M.I.E.E., who has for the past six years been the company's manager and engineer, has been elected to the vacant position of director.

It is announced that MR. DAVID WILLOCK has been elected to a seat on the Read of the Electric Construction Co. Ltd. mendand.

at on the Board of the Electric Construction Co., Ltd., rendered

vacant by the death of Mr. William Bulloch.

MR. ALEX. SPENCER, a director of Messrs. George Spencer Moulton & Co., Ltd., has been elected a director of the British Westinghouse Electric and Manufacturing Co., Ltd.

In the Italian Senate on Tuesday, MR. MARCONI was introduced to the House as a new senator with the customary formalities. Press dispatches state that he was received with long and enthusiastic explanae, in which the public in the gallown is in a second to the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of th siastic applause, in which the public in the gallery joined.

Obituary.-Mr. H. WARD LEONARD.-We regret to read in our American exchanges of the death which occurred suddenly on February 18th in New York, of Mr. H. Ward Leonard. Mr. Leonard was 54 years of age, and at the time of his death he was attending the mid-winter dinner of the American Institute of Relectrical Engineers, of which he was at one time a vice-president, and at another manager. The American Electrical Review says that when he was 23 years of age the deceased gentleman became associated with Mr. Edison, as one of four engineers on his staff selected to introduce the Edison central-station system, and three ars later he was appointed general superintendent of the Western Bleotric Light Co. in Chicago. After some years in private consulting practice, he for a year or two acted as general manager of the light and power departments of the combined Edison interests for United States and Canada, and subsequently in 1891 established his own independent manufacturing business, which is still operating as the Ward Leonard Electric Co., at Bronxville, N.Y. operating as the Ward Leonard Electric Co., at Bronxville, N.Y. For some years past, Mr. Leonard had not taken an active part in the affairs of the company, but had been engaged in experimental work and in the development of his many inventions. Practically all the ships in the U.S. Navy are fitted with his system of control, this application following upon the successful use of the system in one turret of the Brook'yn during the Spanish-American war. His system of motor control was applied to the moving sidewalk at the 1900 Paris Exposition after other systems had been applied unsuccessfully. He was an early worker in connection with the electric lighting of railway trains—indeed his first invention of all, in 1888, related to that subject. He was connected with many technical and other associations, had delivered many papers and

att, in 1888, Friend to that subject. He was connected with many technical and other associations, had delivered many papers and addresses before them, and was awarded various medals.

MR. F. E. POLLABD.—The death has occurred at Hertford, at the age of 55 years, of Mr. F. E. Pollard, a member of the Research Sub-Committee on Insulating Oils appointed by the Institution of

Electrical Engineers.

Sub-Committee on Insulating Oils appointed by the Institution of Electrical Engineers.

ME. THOMAS SWINYARD.—The Times reports that the death took place in New York, on February 25th, of Mr. Thomas Swinyard, who went to Canada in 1862, at the request of the British shareholders of the Great Western Railway Co. of Canada, as their general manager. He was appointed general manager of the Dominion Telegraph Co. in 1875, and subsequently president, an office which he held until his death.

ME. HOWELL ASHBRIDGE GODBY, who had spent four years at Faraday House, and joined the H.A.C. at the beginning of the war, died on February 19th in hospital in France as the result of wounds received in action on February 14th.

In the latest casualty list there appears the name of SECOND-LIEUT, J. L. MOFFETT, Royal Scotz Fusiliers, who has been killed in action. Lieut. Moffett was 27 years of age, and obtained his commission last September. He was educated at Watford Grammar School and Manchester University, where he graduated B.Sc. (Eng.). He was an Associate of the Institution of Electrical Engineers. Up to 18 mouths ago he was engaged at the Lance, and Yorks, Railway Co.'s Works at Horwich, near Bolton H-1eft there to take a position with the Chloride Co., at Clifton, near Manchester. He had been at the Front five weeks.

Will.—The late Mr. W. EDGAR ALLEN, of Sheffield (Edgar Allen & Co., Ltd., Imperial Steel Works), left £271,068 gross and £251,792 net. Various charities and employés benefit to the extent of £150,000. After various legacies are dealt with, he leaves two-fifths of the residue to the University of Sheffield, partly to the Committee of the Applied Science Department, and partly for founding Edgar Allen Scholarships for students at the Univergity,

#### NEW COMPANIES REGISTERED.

Drycells, Ltd. (139,605).—This company was registered on March 11th with a capital of £100 in 10s, shares, to carry on the business of manufacturers of electric refill batteries for pocket and other lamps. The subscribers (with five shares each) are: R. W. Gale, 259, Goldhawk Road, W., clerk; J. Dunkley, 46, Devonshire Road, Colliers Wood, Merton, S.W., electician. Private company. The number of directors is not to be less than two or more than five; the first are R. W. Gale and W. H. R. Hargrave, Qualification £5. Registered office: 24, John Street, Bedford Row, W.C. Sunlight Manufacturing Co., Ltd. (139,636).—This company was registered on March 13th, with a capital of £1,000 in £1 shares, to carry on the business of manufacturers of and dealers in electric batteries for pocket lamps and torches, general electrical goods and accumulators, magnetos, motor-cars, motor and other cycles, etc. The subscribers (with one share each) are: J. Abrahams, 54, Redcross Street, E.C., manufacturer's agent; P. Abrahams, 54, Redcross is not to be less than two or more than five; the first are J. Abrahams and P. Abrahams (both permanent). Qualification 100 shares. Registered office: 1 & 3, Paxton Road, Tottenham, N.

#### OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Sterling Telephone and Electric Co., Ltd.—Mortgage, dated 8th February, 1915, to secure £10,000 and further advances, charged on certain land at Dagenham, Essex, and company's undertaking and property, present and future, including uncalled capital. Holder: Secretary of State for

Newcastle-upon-Tyne Electric Supply Co., Ltd.—Charge, as substituted security on shares in Carville Site and Power Co., Ltd., which may be acquired by the company, dated 5th March, 1915 (supplemental tortust deeds dated 30th June, 1909, and 10th November, 1914, securing £884,500, debenture stock). Trustees: Rt. Hon. Viscount Ridley, and Rt. Hon. W. B. Cunlife.

Foster Engineering Co., Ltd.—Issue on 10th February, 1915, of £2,208 7s. 2d. debentures, part of a series of which particulars have already been filed.

Carrara-Persilia Electric Railway and Power Co., Ltd.-Deed of further charge on a certain concession, and company's other a present and future, including uncalled capital, dated 28th February, 1915, plemental to charge dated 28th May, 1914, to secure £40,000. Holders: mercial Bank of Scotland, Ltd., 62, Lombard Street, E.C.

Consolidation) Act, 1908, the amount of the present issue being £500 debentures, (Consolidation) Act, 1908, the amount of the present issue being £50. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

Rangoon Electric Tramway and Supply Co., Ltd.—A memorandum of satisfaction to the extent of £1.410 on 3rd February; and £4.785 on March 10th, 1915, of debenture stock, dated 1st February, 1906, 22nd December, 1906, and 5th November, 1913, securing £250,000, has been filed.

Edison Accumulators, Ltd.—Debenture, dated 10th March. 1915, charged on company's property, present and future, including uncalled capital, to secure all moneys due or to become due from the company to London County & Westminster Bank, Ltd., not exceeding £5,000.

#### CITY NOTES.

#### British Electric Transformer Co., Ltd.

THE directors report that they consider the result for 1914 satisfactory. The accounts show that after paying all manufacturing costs and expenses of administration there remains a net profit of £16,235, plus £4,108 brought forward, making £20,343. They recommend that there be placed to reserve account £5,000, to depreciation reserve £1,500, preference dividend of 6 per cent. £3,719, dividend of 7½ per cent. on the ordinary shares £6,410, extra remuneration to the directors £237, leaving to be carried forward £3,478. The directors refer to the death of Mr. J. F. Albright, the chairman of the company.

Annual meeting: To-day.

### Bath Electric Tramways, Ltd.

Bath Electric Tramways, Ltd.

The traffic and other receipts for 1914 show a decrease of £1,410 for the 52 weeks compared with the 53 weeks of the previous year. But for the receipts obtained in respect of special military services rendered by the motor vehicles, the decrease in the earnings brought about by the war would have been more pronounced. Certain economies effected in operating costs have to a great extent been offset by additional expense incurred in connection with these military traffics. In September, 1914, the company was called upon to dispose of several of its torpedo cars to H.M. War Department. The cars thus impressed or disposed of to army contractors have reduced the motor fleet by 14 vehicles. Arrangements have, however, been made for replacing some of these vehicles at the earliest possible dates consistent with the requirements of the Army. The foundry belonging to the company continues to give most satisfactory results. Approximately one half of the company's employés have joined H.M.'s company continues to give most satisfactory results. Approximately one half of the company's employés have joined H.M.'s naval or military forces. After charging the expenses of eperation and administration, there remains a balance of £16,133. After paying debenture interest and sinking fund charges, and paying the preference dividend for the year there is a balance of £5,224, which the directors recommend should be carried forward, and should be used towards replacement of the motor fleet, etc. They consider that, by the adoption of this policy, provision is made for depreciation in a most effective form. in a most effective form,

Davis & Timmins, Ltd.—Sir Henry Mance presided at the annual meeting on 9th inst., and said that they had attained the results mentioned in the report in spite of the war, and not through busin as resulting directly from it. The outbreak of hostilities caused a serious set back from which they did not entirely recover until nearing the end of the year, but their trading during the earlier months had been very satisfactory, and they were, therefore, able to show results nearly as good as those for 1913. Ready money had enabled them to secure the stock of metal absolutely necessary to carry on their work. They were full of work, and were likely to be so for a con-iderable time. Mr. G. E. Davi, the managing director, said that the opening of the war found them well equipped with good stocks of metal and an efficient plant. To-day they were in a favourable position to deal with the ecormous pressure of orders that had been put upon them. The existing state of things was such that no man culd tell what the difficulties of obtaining supplies, even against cash, might be in the near future, but anything that forethought and anticipation of events could do had been done, and would continue to be done. Though it was their first and bounden duty to give preferential treatment to war supplies, they were in no way neglecting their old customers, the mainstay of the business, and their best effort; were b ing used to cause them as little inconvenience as possible. Generally spaking, the whole of the works were employed on war material, either as contractors or as subcontractors.

British Insulated and Helsby Cables, Ltd.—The profit for 1914 was £277,428, plus £98,267 brought forward, making £375,695. From this have to be deducted directors and debenture trustees' fees, and remuneration to Works' Committee, £5,815; interest on first debenture stook, £22 500; interest on second debenture stook, £10,000; depreciation on buildings, plant, machinery, &c., £25,000; transfer to reserve account, £50,000; transfer to special reserve account, £50,000; transfer to special reserve account, £5,000; pension front, £25,000: dividend on preference shares to December 31st, 1914, £30,000; interim dividend on ordinary shares to June 30th, 1914, £20,000, leaving available for dividend £174,380. The directors recommend a further dividend of 11s, per share on the ordinary shares, making a total of 15 per cent, for the year, £55,000, carrying forward £119,380. There has again been an increase in the volume of trade compared with last year, and this has resulted in an additional profit of £30,077. £25,000 is applied to depreciation on buildings, plant and machinery, as against £22,000 last year. An amount of £25,000 has been set aside to form the nucleus of a pension fund, and the directors will ask the shareholders to approve this proposal. Aunual meeting, March 22nd, at Liverpool.

W. T. Henley's Telegraph Works Co., Ltd.—The directors report that during 1914 a profit of £119,246 was made. Deducting directors' and auditors' fees, debenture interest, incometax, and amount written off for depreciation on buildings and machinery, £29,121, and adding £59,065 brought forward, there is a total of £149,191. Deducting transfer to reserve account, £20,000; transfer to special reserve account, £10,000; dividend on preference shares to December 31st, 1914, £9,000; interim dividend on ordinary shares, £10,000; and income-tax on interim dividend on ordinary shares, £771, there remains an available balance of £99,420. The directors recommend the payment of a final dividend on the ordinary shares of 10 per cent., less income-tax; making 15 per cent for the year; and also a bonus of 51 per share, less income-tax, and this will require £30,000, leaving £69,420 to be carried forward. Annual meeting: to-day.

Automatic Telephone Manufacturing Co., Ltd.—With reference to the paragraph in our last issue the directors' report now received shows that the profit for the year 1914 was £38,248 plus £3,219 brought forward. Directors' fees require £2,450, depreciation on patents, goodwill, buildings, plant and machinery absorbs £5,760, there is written off underwriting commission on shares £3,500, written off preliminary expenses £1,700, the dividend on preference shares requires £12,000, and after paying 3 per cent. on the ordinary shares, £5 256 will remain to be carried forward. During the year more progress has been made in the installation of automatic telephone equipment, and the general business of the company has been satisfactory. Annual meeting, March 22nd at Liverpool.

Dublin and Lucan Electric Railway Co.—Mr. J. W. Hill, presiding at the annual meeting, stated that the gross receipts were £7,367, being £40 less than in the previous year, and the expenditure had decreased by £12. The balance was £362, which was carried to next account payment of cumulative preference dividend being postponed. Receipts for the sale of electric current in 1914 amounted to £208, against £142 in 1913. It was announced that the company had secured a favourable contract for the carriage of mails and parcels between Dublin, Chapelizod, Palmerstown, Lucan and Leixlip.

Mexican Northern Power Co.—The Financial News states that a meeting of the holders of the 5 per cent. first mortgage 30-year gold bonds is to be held on March 30th, for the purpose of consenting to the company's issuing from time to time the remaining \$2,000,000 6 per cent. prior lien 30-year gold bonds.

South London Electric Supply Corporation, Ltd.— The directors have declared the dividend on the 6 per cent. cumulative preference shares for the half-year to April 1st next, payable on that day. Madras Electric Tramways (1904), Ltd.—The accounts for 1914 show a gross profit of £21,522. After debiting interest and London office expenses, making provision for the debenture stock sinking fund, and transferring £7,000 to the depreciation and renewal fund, there remains a balance of £9,300, plus £3,321 brought forward, making a total of £12,621. A dividend of 6 per cent. per annum on the preference shares absorbs £6,000, a dividend of 5 per cent. per annum on the ordinary shares requires £2,863, there is written off from the cost of issue of new preference shares £500, leaving £3,258 to be carried forward. The traffic receipts show an increase of 3 5 per cent. upon 1913. Down to the end of July the increase was 8 7 per cent, but since that date the receipts have suffered on account of the outbreak of war. As heretofore, the undertaking has been maintained out of revenue, and special improvements and renewals have been debited to the depreciation and renewal fund. The reserve arising from the debenture stock sinking fund now amounts to £6,280. Annual meeting, March 23rd.

Yorkshire (West Riding) Electric Tramways Co., Ltd.—Holders of this company's 6 per cent. bearer bonds are informed that, owing to the situation created by the war, it is almost impossible to get deliveries of suitable material at reasonable prices. The board therefore intend to defer the expenditure on those works for which the money was raised by the issue of 6 per cent. bonds. Consequently, it is proposed to redeem bonds to the value of £10,000, and holders are asked whether they are willing for a portion or the whole of the bonds they hold to be redeemed, plus accrued interest to date. The offer to repay at so early a date is exceptional, as also are the causes which have led to the offer — Financier.

Wycombe (Borough) Electric Light and Power Co, Ltd.—At the annual meeting on 10th inst., the directors reported that further progress had been made during 1914, the connections having risen to 68,306, an increase of 3,056 equivalent 8 CP lam.». Including £169 brought forward, there was a profit to the credit of net revenue account of £6,506, and after paying interest on debentures and outstanding accounts amounting to £3,322, there remained £3,184 available for distribution. A dividend at the rate of 2½ per cent. for the year will absorb £1,000, and £2 000 is to be placed to the reserve fund for renewal account, leaving £184 to be carried forward.

Shawinigan Water and Power Co.—The revenue from all sources for the year 1914 was \$1,805,217; the net income, after making provision for operation and interest, was \$1,081,347. After paying a dividend at the rate of 6 per cent. for the year, there is transferred to reserve and sinking fund \$200,000, to depreciation reserve \$100,000, to contingent fund \$20,000, and the surplus undistributed is \$39,473. The net revenue bears the ratio of 8 6 per cent. to the total outstanding common stock at the end of the year, but the proceeds of the isane of \$1,375,000 of common stock were received only in July, 1914.

Wedmore Electric Light Co., Ltd.—At the annual meeting the managing director (Mr. W. G. Burrough), who presided, gave a full report on, and expressed the entire satisfaction of the directors with, the year's working, although they were only able to recommend payment of dividend at 4 per cent. instead of £5 per cent. The set-back was caused by increase in the price of materials for wiring houses, &c., and would not recur. A vote of thanks was passed to the managing director for his voluntary efforts on behalf of the company during the year.

Wemyss and District Tramway Co.—An income of £14,955 shows that the war has not seriously affected receipts, while the management effected economies in several ways. The directors recommend that, out of the profit of £6,819, a dividend of 7½ per cent. be paid on ordinary thares, and 1½ per cent. extra on the 6 per cent. preference shares—7½ per cent. in all—and the balace, £1,580, be carried forward. During the year the doubling of part of the line was completed.

Ontario Power Co. (of Niagara Falls).—The report for 1914 shows total receipts. \$1,825,320; net income, \$1.398,522; interest, \$398,443; surplus, \$500,078. Owing to the provisions of the Railway Act of Canada, which are by charter made applicable to the company, the declaration of dividends should be made by the shareholders at the regular annual meeting. The payment of dividends during the year 1915 will not therefore be made in quarterly instalments.—Financial News.

Oldham, Ashton and Hyde Electric Tramway, Ltd.—For 1914 the revenue was £33,398, and the expenditure £26.024, leaving a net profit of £7,374, plus £147 brought forward. It is proposed to place to reserve fund £1,000, to pay a dividend at the rate of 6 per cent. per aunum on the ordinary shares, and to carry forward £1,021.

Folkestone Electricity Supply Co., Ltd.—For 1914 the directors report a net revenue, including £538 brought forward, of £20,024. After transferring £5,661 to depreciation account and placing £8,500 to reserve, a further dividend of 4 per cent., making 7 per cent. for the year, is recommended, leaving £1,438 to be carried forward.

Liverpool District Lighting Co., Ltd.—After transferring £1,000 to reserve fund, a dividend at the rate of 4 per cent. per annum, less income-tax, is to be paid for the December, 1914, half-year.

### Direct Spanish Telegraph Co., Ltd.

The accounts for 1914 show, after providing for interest on, and redemption of, debentures, and for the dividend on the preference shares, a balance of £28,898. The directors consider the opportunity a favourable one for dealing with the question of depreciation on the company's investments which has been progressive for several years, and now amounts to the large sum of £19,212. They therefore propose to apply the balance of £28,898 as follows:—Dividend on the ordinary shares at 4 per cent. per annum £2,586, bonus on ordinary shares of 2 per cent. £1,293, to writing down Stock Exchange securities £19,212, to reserve fund £5,000, and to carry forward £807. Both the dividend and the bonus on the ordinary shares will be paid free of income tax. The £30,000 4½ per cent. first mortgage debentures created in June, 1894, fell due for payment on June 30th last, and were redeemed at that date. To enable this to be done without realising securities at a considerable loss, a loan of £30,000 was obtained from the Eastern Telegraph Co. The Bilbao cable became interrupted on September 23rd last, three knots from the landing place in Cornwall, and the necessary repairs were carried out by the cable steamer Electra, the cable being reopened for traffic on September 27th after an interruption of five days. The cost of these repairs, viz., £328, has been charged to revenue.

The annual meeting was held yesterday.

### County of London Electric Supply Co., Ltd.

The annual meeting was held on Monday, at Winchester House, E.C. Mr. J. B. Braithwaite, who presided, said that they would remember that at the last meeting he told them they proposed to issue 10,000 additional preference shares of £10 each and 6,000 additional ordinary shares of £10 each, which reject the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the figure of each deposition of the each deposition of the each deposition of the each deposition of the each deposition of the each deposition of the each d which raised the figure of each denomination of share to £650,000. The issue was made on terms which secured them a premium of £19,000, and they proposed to utilise £5,000 of that sum in writing down preliminary expenses, carrying forward £14,000 as a reserve against any future contingencies that might arise. The issue was over-subscribed and they had every reason to congratulate themselves upon having made it every reason to congratulate themselves upon naving made it when they did, as after the war broke out it might have been very difficult for them to find the funds they required for the development of the business. On the credit side of the balance sheet there was a considerable increase in the investments. That was due chiefly to the purchase of a block of shares in the South London Electric Supply Co. That was a company whose area adjoined their own, and whose system of supply was also identical with theirs, and it was a company with whom there appeared to be a good opportunity of their working together in closer relations, and it was possible that something might be done in that direction during the present year. The South London Co. had shown considerable progress even this year, when the bulk of the London companies were shown in gategrasses in revenue and in earnings. They had expended this year, when the bulk of the London companies were showing decreases in revenue and in earnings. They had expended a good deal of capital during the past year, but when they saw what the results had been he thought they would say that none of it had been expended unwisely. They had expended altogether £167.916, of which £94.917, or 56.52 per cent. of the total, was for mains. Included in that expenditure on mains was a considerable amount for a new interconnector between their station at City Road and their Wandsworth station. Already they had derived considerable advantage from that inter-connector—the engineer-in-chief telling him that during the first two months of the current year its use had enabled them to secure an economy of 15 per cent. The rest of the expenditure on mains had been made on the The rest of the expenditure on mains had been made on the lines he had previously indicated. They did not lay mains at random—they only laid them where they would bring them at random—they only laid them where they would bring them profitable business, and that had been the case this year. In spite of the five months war period which the accounts covered, the earnings had increased from £255,670 to £274,080, an increase of £18.410. £14,000 of that increase was due to increased receipts from sale of current, the balance being made up by increased rentals of meters and increased dividends from their investments, which included the return of the South London Electric Supply Co. shares to which he had referred. They were able to carry to not revenue £164,043 against £147,812, an increase of £16,231. In other words, of the £18,410 gross increase they retained £16,231 as net and available for distribution. In view of the special circumstances which prevailed he thought they would agree that such a result reflected very great credit upon their technical stances which prevailed he thought they would agree that such a result reflected very great credit upon their technical staff; and the increase in the gross revenue reflected equally great credit upon the commercial staff. Out of the net revenue they had placed £40,000 to reserve for depreciation, repairs and renewals, instead of £33,000 as last year; in other words, they were placing an additional £7,000 to that fund, and after doing that they carried forward to the balance sheet £86,841 as against £76,978 last year, or roughly £10,000 more. They had therefore disposed of the increased revenue £16,000 by placing £7,000 extra to the depreciation fund, they had paid the dividend on the new capital, which had absorbed £4,405, and they proposed to raise the carry forward by £4.405, and they proposed to raise the carry forward by £5.458—from £7,000 to £12,500. Even after placing the £7,000 additional to depreciation, raising that allocation to the substantial sum of £40,000, they still earned double the amount
